

Comment Number	Received From	Question/Comment	Response(s)
6043	Adams, S., City of Long Beach	Please define "waste generator"	Comment noted, throughout the regulatory text the term generator is used synonymously with the term "organic waste generator."
6044	Adams, S., City of Long Beach	Tier two generators - there is a discrepancy as to when they are required to begin donating usable food. Is it in 2024 or 2025?	The regulations clearly state that tier one commercial edible food generators are required to comply beginning January 1, 2022 and tier two commercial edible food generators are required to comply beginning January 1, 2024.
6045	Adams, S., City of Long Beach	Regarding organics collection from the public, it's mentioned that there needs to be collection in public parks. Is this intended to be for events in parks or organics collection 24/7 in parks? Unattended public food waste collection will undoubtedly be heavily contaminated.	The regulations do not require that organics recycling containers be placed next to trash containers in public areas, such as public parks, beaches, etc.
2037	Adams, Tracy; GreenWaste Recovery, Inc.	Utilizing the strengths of both company's expertise, many of GreenWaste's municipal customers are already leading the state in diversion of organics materials from landfill. While we applaud the intent behind SB 1383, we do have some concerns (detailed below) that the verbiage in the Proposed Regulation Text limits company's abilities to innovate in different ways to achieve the goals of SB 1383, and in some cases could make existing technology that has been implemented and shown to be successful in reaching CalRecycle's goals obsolete. Based on the cost of implementation, conversations with CalRecycle staff, and the massive capital investment that SB 1383 will require throughout the state, we are certain that relegating existing facilities obsolete is not the intent of CalRecycle with this regulation, so would respectfully request the following considerations relating to the Proposed Regulation Text.	Comment noted. The comment is an introductory statement for specific suggestions.
2038	Adams, Tracy; GreenWaste Recovery, Inc.	Sections 18982.a.1 (46) and 18982.a.1 (55) B – Regarding the definitions of "Organic Waste" and "Prohibited container contaminates": Section 18982.a.1 (46) adds lumber into the definition of Organic Waste where section 18982.a.1 (55) B calls out "hazardous wood waste" as a prohibited container contaminant. Both definitions bring areas of ambiguity into what, exactly, is allowed as an Organic Waste and what is considered a Prohibited container contaminate. As it stands, it could be interpreted that treated lumber (for example) would be considered an organic material. While it is made of a ase organic material, once this material is treated, it can no longer be recycled nor composted, and should be removed from the definition of Organic Waste. <b>Recommendation: For Section 18982.a.1 (46), we would encourage CalRecycle to add the term "clean" (or a much broader definition of clean) prior to the term "lumber."</b>	CalRecycle is leaving the applicable definitions as-is. Lumber defined as "hazardous wood waste" cannot be recovered through composting and is therefore specifically called out in the definition of "prohibited container contaminants."
2039	Adams, Tracy; GreenWaste Recovery, Inc.	Similarly, Section 18982.a.1 (55) B declares "hazardous wood waste" as a contaminate in a green container. The term "hazardous wood waste" is not defined in the regulation. Currently, painted or treated wood are considered contaminates to the organics system, and we believe should continue to be excluded from the definition.	The regulations were amended to include a definition of "hazardous wood waste."

Comment Number	Received From	Question/Comment	Response(s)
		<p><b>Recommendation: Either add a definition for “hazardous wood waste,” or add the following clarifiers after the word “waste”: “including painted, treated, laminated, particle board, fiberboard, or chipboard.”</b></p>	
2040	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18982.a.69 – The definition of “Source separated organic (SSO) waste” means organic waste that is placed in a container that is specifically intended for the separate collection of organic waste by the generator.</p> <p>In approximately 40 jurisdictions throughout California, a “loose in the street” (LIS) collection methodology is used, where the homeowner is allowed to take their yard trimmings and prunings and place them in a pile on the street for subsequent collection via a claw loader and rear load collection vehicle working in tandem to scrape the yard trimmings from the street and place them in the collection vehicle. In the case of many cities, a segregated yard trimmings collection process is the SSO program, and the remainder of organic materials are then placed into the grey (solid waste) bin for processing at a High Diversion Mixed Waste Processing facility. Per the definition as written, this material would no longer be considered a SSO program since the materials is not containerized. It has demonstrated for many years that a LIS program achieves an extremely high level of organics diversion when paired with the processing of the solid waste fraction.</p> <p><b>Recommendation: Alter this definition to allow for the LIS collection methodology by adding the following to the definition after container “(or placed out for an alternatively approved collection system).”</b> Ultimately, the goal is to remove additional organics materials from the landfill, and the existing language would negate a system that is already removing a significant tonnage of organics materials from being placed in the landfill.</p>	<p>CalRecycle revised Sections 18984.1, 18984.2, 18984.3, and 18984.5(b)(1)(B) to clarify that loose-on street (i.e., un-containerized) green waste collection is allowed as long as it does not include food waste, which must be containerized, and the receiving facility will accept the green waste and still be in compliance with operational and product quality standards. This is necessary because some jurisdictions use this method year-round to collect green waste and others use it as a supplement in the fall due to spikes in green waste generation; it would be costly to provide extra containers for this material when it can be allowed to accumulate on streets where it can be efficiently collected.</p> <p>This revision necessitated another change to Section 18984.5 to modify the contamination monitoring education requirements, since there would not be a container available to place educational materials on for routes that are exceeding contamination levels. Recommend adding “or door” after the term “container” in section 18984.5(b)(1)(B) to allow for notification in areas where non-containerized loose in the street collection is utilized.</p> <p>Thank you for the comments in support of the language change that was made in response to concerns about green waste loose on the street.</p>
2041	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18984.x – “This article specifies the minimum standards for organic waste collection services provided by jurisdictions, outlines efforts jurisdictions must engage in to reduce container contamination, delineates container color and labeling requirements...”</p> <p>While we understand the intent of this section to proscribe to jurisdictions how they can be compliant with the SB 1383 requirements, we also feel that this section is too prescriptive, and does not allow for alternative methodologies to achieve the goals of this legislation. While this section allows for three, two, or one bin collection systems, it does not allow for the collection of yard trimmings through a loose in the street program or any other program that does not fit into a traditional two or three stream programs. The ability for jurisdictions and companies to innovate has long been encouraged and has led to new technologies and procedures that meet and exceed state goals.</p> <p>In the regulations as written for a three-cart system, all organics must be placed into a green container, unless the grey container is taken to a high diversion mixed waste processing facility, which would allow “food based” organics to be placed into the grey bin, while “greenwaste” organics could be processed at a source separated organics facility. By keeping the food-based organics separate from the greenwaste</p>	<p>CalRecycle revised Sections 18984.1, 18984.2, 18984.3, and 18984.5(b)(1)(B) to clarify that loose-on street (i.e., un-containerized) green waste collection is allowed as long as it does not include food waste, which must be containerized, and the receiving facility will accept the green waste and still be in compliance with operational and product quality standards. This is necessary because some jurisdictions use this method year-round to collect green waste and others use it as a supplement in the fall due to spikes in green waste generation; it would be costly to provide extra containers for this material when it can be allowed to accumulate on streets where it can be efficiently collected.</p> <p>This revision necessitated another change to Section 18984.5 to modify the contamination monitoring education requirements, since there would not be a container available to place educational materials on for routes that are exceeding contamination levels. Recommend adding “or door” after the term “container” in section 18984.5(b)(1)(B) to allow for notification in areas where non-containerized loose in the street collection is utilized.</p> <p>Thank you for the comments in support of the language change that was made in response to concerns about green waste loose on the street.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>organics, you are able to make distinct levels of compost, both an “MSW” compost (suitable for tree and landscaping uses) and an “organic” compost (suitable for ground based crop uses), thus maximizing the usefulness of both commodity streams.</p> <p><b>Recommendation: As with the definitions, we would request that a provision for loose in the street collection in all collection methodologies. The verbiage as it stands requires the jurisdiction to containerize materials (or at a minimum in the three-cart system provide a cart that may not be used in certain programs).</b></p>	
2042	Adams, Tracy; GreenWaste Recovery, Inc.	<p>In section 18984.7 a jurisdiction is required to provide collection containers that comply with the container color requirements in the article. It remains unclear if roll off (and/or compactor) containers would need to follow the same color guidelines in the event a large customer (such as a campus) were to subscribe to services in such a manner.</p> <p>The cost of keeping multiple sizes of roll off bins in multiple colors will be extraordinary, as will the cost of land to store the multiple bins needed to comply with this section.</p> <p><b>Recommendation: Allow roll off containers and compactors to be of a neutral color and used for different commodities and defined by signage on the bin.</b></p>	<p>Roll-offs are included; however, the regulations allow flexibility with phased timelines, color being on the lid or container. Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container. The collection container uniformity required by this and subsequent sections is necessary to respond to stakeholder feedback, enhance consumer education about organic waste recycling, reduce contamination, and maintain the highest degree of recoverability for source separated organic wastes. This will enhance the education of generators regardless of their location in California. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products.</p> <p>Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life. The regulations allow labels to be applied to existing bins or lids until the containers are replaced either at the end of their useful life or by 2036. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life or by 2036.</p>
2043	Adams, Tracy; GreenWaste Recovery, Inc.	<p>In section 18984.7 a jurisdiction is required to provide collection containers that comply with the container color requirements in the article. It remains unclear if roll off (and/or compactor) containers would need to follow the same color guidelines in the event a large customer (such as a campus) were to subscribe to services in such a manner. In the event of roll off based compactors, most of these are owned by the</p>	<p>CalRecycle revised Sections 18984.1, 18984.2, 18984.3, and 18984.5(b)(1)(B) to clarify that loose-on street (i.e., un-containerized) green waste collection is allowed as long as it does not include food waste, which must be containerized, and the receiving facility will accept the green waste and still be in compliance with operational and product quality standards. This is necessary because some jurisdictions use this method year-round to collect green waste and others use it as</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>customer and it will be extremely difficult to enforce painting of these containers, so we strongly suggest that identification of these would follow the same methodology as roll off containers.</p> <p>Additionally, this section specifies a jurisdiction “shall” provide containers to generators that comply with the color requirements specified earlier in the section.</p> <p><b>Recommendation: Change the verbiage so that all containers provided by a jurisdiction shall comply, allowing for a provision of loose in the street collection with no container.</b></p>	<p>a supplement in the fall due to spikes in green waste generation; it would be costly to provide extra containers for this material when it can be allowed to accumulate on streets where it can be efficiently collected.</p> <p>This revision necessitated another change to Section 18984.5 to modify the contamination monitoring education requirements, since there would not be a container available to place educational materials on for routes that are exceeding contamination levels. Recommend adding “or door” after the term “container” in section 18984.5(b)(1)(B) to allow for notification in areas where non-containerized loose in the street collection is utilized.</p> <p>Thank you for the comments in support of the language change that was made in response to concerns about green waste loose on the street. Regarding roll-off containers owned by an organic waste generator, the regulations place the requirement on the commercial business. The regulations require that the containers provided by the business shall have either:</p> <p>(A) A body or lid that conforms with the container colors provided through the organic waste collection service provided by their jurisdiction; or</p> <p>(B) Container labels that comply with the requirements of Section 18984.8.</p>
2044	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18984.5 determines how containers should be monitored for contamination on the daily routes. As this provision exists, there is a burden to monitor all routes, even those that have shown that they are consistently complying with the provisions of SB 1383. While we understand CalRecycle’s desire to monitor all routes for compliance, we believe that this can be accomplished by looking at the load checks when materials enter the transfer or processing facility. We feel a small adjustment to this section can achieve CalRecycle’s goals and keep the cost to jurisdictions lower.</p> <p><b>Recommendation: Have section “c” of this provision become the driver to require route audits. Once a jurisdiction is informed of a contaminated route, then begin conducting route audits and tagging of violators per subsection “b”.</b></p>	<p>Thank you for the comment. The comment is in support of the current language.</p> <p>For clarity, the regulations allow the jurisdictions to determine random selection, which is the least costly and burdensome approach compared to requiring statistically significant sampling. In regard to if the program will meet compliance, this has been addressed in language changes to Sections 18984.5 and 18984.6.</p> <p>CalRecycle disagrees with making it a requirement that contamination monitoring is random as it would limit flexibility and increase costs.</p>
2045	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18984.5 determines how containers should be monitored for contamination on the daily routes. This would prevent jurisdictions from having to allocate resources to auditing high performing routes and allow for more time being spent on routes that are exceeding contamination levels.</p> <p><b>Recommendation: Add “or door” after the term “container” in section 18984.5 (b) (1) (B) to allow for notification in areas where non-containerized loose in the street collection is utilized.</b></p>	<p>CalRecycle revised Sections 18984.1, 18984.2, 18984.3, and 18984.5(b)(1)(B) to clarify that loose-on street (i.e., un-containerized) green waste collection is allowed as long as it does not include food waste, which must be containerized, and the receiving facility will accept the green waste and still be in compliance with operational and product quality standards. This is necessary because some jurisdictions use this method year-round to collect green waste and others use it as a supplement in the fall due to spikes in green waste generation; it would be costly to provide extra containers for this material when it can be allowed to accumulate on streets where it can be efficiently collected.</p> <p>This revision necessitated another change to Section 18984.5 to modify the contamination monitoring education requirements, since there would not be a container available to place educational materials on for routes that are exceeding contamination levels. Recommend adding “or door” after the term “container” in section 18984.5(b)(1)(B) to allow for notification in areas where non-containerized loose in the street collection is utilized.</p> <p>Thank you for the comments in support of the language change that was made in response to concerns about green waste loose on the street.</p>

Comment Number	Received From	Question/Comment	Response(s)
2046	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18984.11 (a) (3) provides for Collection Frequency Waivers wherein “a jurisdiction may allow the owner or tenant of any residence, premise, business establishment or industry that subscribes to a three-container or two-container organic waste collection service to arrange for a service that collects waste not placed in the green container once every fourteen days, provided that:</p> <ol style="list-style-type: none"> <li>1. The jurisdiction, or its authorized hauler, demonstrated to the Solid Waste Local Enforcement Agency that less frequent collection than required by Section 17331 of Title 14 of the California Code of Regulations will not result in the propagation of vectors or other public health and safety, or nuisance issues.</li> </ol> <p>For reference, Section 17331 of Title 14 is as follows:  “(H) The owner or tenant of any premises, business establishment or industry shall be responsible for the satisfactory removal of all refuse accumulated by him on his property or his premises. To prevent propagation, harborage, or attraction of flies, rodents or other vectors and the creation of nuisances, refuse, except for inert materials, shall not be allowed to remain on the premises for more than seven days, except when:</p> <ol style="list-style-type: none"> <li>(a) disruptions due to strikes occur, or</li> <li>(b) severe weather conditions or “Acts of God” make collection impossible using normal collection equipment, or</li> <li>(c) official holidays interrupt the normal seven day collection cycle in which case collection may be postponed until the next working day. Where it is deemed necessary by the local health officer because of the propagation of vectors and for the protection of public health, more frequent removal of refuse shall be required.”</li> </ol> <p>While we understand it is the intent of CalRecycle to offer less than weekly services on inert materials, we have concerns about the real-life application of this section. Take, for example, a jurisdiction who has the following collection system:</p> <ul style="list-style-type: none"> <li>Curbside Yard Trimming Collection in a green cart (Source Separated Organics)</li> <li>On premise recyclable in a blue cart</li> <li>On premise solid waste and mixed organic collection in a grey cart (Mixed Waste Processing)</li> </ul> <p>This program would still have organics in the grey cart (and likely smaller amounts as contaminants in the blue container) and thus would be required by Section 17331 of Title 14 to subscribe to weekly collection. We believe that the option of bi-weekly collection will create an auditing challenge and jurisdictions will be double burdened – not only having their collection revenue decreased, but also incur an additional expense to monitor the system.</p> <p><b>Recommendation: Remove Section 18984.11 (a) (3) from these regulations.</b></p>	A change in language is not needed because nothing in the regulations requires a jurisdiction to offer less frequent collection services.
2047	Adams, Tracy; GreenWaste Recovery, Inc.	<p>In section 18990.1 (b) (5), CalRecycle requires that “a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that do any of the following: (5) Require a generator to use an organic waste collection service or combination of services that</p>	A change to the regulatory text is not necessary. CalRecycle disagrees. This section will not conflict with market conditions. Potential market shifts will impact all facilities. This section is necessary because the statute is intended to increase organics recycling, not decrease organics recycling.

Comment Number	Received From	Question/Comment	Response(s)
		<p>do not recover at least the same types of organic waste recovered by a service the generator previously had in place.”</p> <p>As an organic’s processor, this provision is concerning as markets and ability to compost can shift, similar to the market shifts we have seen in the recycling markets. It is our premise that we must be able to adjust to shifting market conditions. For example, “compostable” single use food ware has become a relatively commonly accepted material in many organics’ programs.</p> <p>Though these materials are accepted in the programs, the material will not break down in a commercially reasonable timeframe and become contaminates to the organic’s program. Other materials that can vary by program include palm fronds and yucca.</p> <p>While we understand it is CalRecycle’s desire to ensure that programs grow going forward, it is imperative that each jurisdiction can design programs that fit their needs, which includes the ability to adjust to changing technologies and markets. Without this ability, haulers will be required to accept contaminants into their program if previous haulers have allowed them.</p> <p><b>Recommendation: Remove section 18990.1 (b) (5) from the regulations.</b></p>	<p>This provision is simply designed to prohibit a jurisdiction from requiring a generator to send its material to a facility that will recycle less of it than one they are currently sending it to.</p>
2048	Adams, Tracy; GreenWaste Recovery, Inc.	<p>As a processor, we applaud CalRecycle’s inclusion of section 18993.1 – the Recovered Organic Waste Product Procurement Target. Having a viable market for materials after the collection, sorting and processing of organics materials is critical to encouraging development of new and expanded organics processing facilities. Currently, section 18993.1 (f) mandates that only two products will be included in the procurement targets: Compost and Renewable transportation fuel.</p> <p><b>Recommendation: Add renewable electricity produced through a California-based Anaerobic Digestion Facility or California-based Urban Biomass facility.</b></p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p>
2049	Adams, Tracy; GreenWaste Recovery, Inc.	<p>The intent of the SB 1383 regulations is to have an accurate accounting of the flow of organics materials throughout the mixed waste streams. While a volumetric conversion factor can give a general idea of what is happening in these facilities, it does not present an accurate picture of the actual disposition of organics materials. With smaller facilities going through the EA Notification Tier permitting and thus not being required to put scales in their facilities, there is a very grey area in terms of reporting.</p> <p><b>Recommendation: Require all processors of organic materials to have scales at their facilities and accurately report all weights.</b></p>	<p>CalRecycle has revised Sections 17409.5.9 in response to comments. The change to Section 17409.5.9 will allow the EA, with concurrence by the Department, to approve an alternative method described under Section 1855.1.9(g) if scales are not accessible. This change will align with the adopted AB 901 regulations (RDRS).</p>
2050	Adams, Tracy; GreenWaste Recovery, Inc.	<p>As one of the premier processors of organics materials in Northern California, our family of companies is excited to work with CalRecycle to implement the changes dictated by SB 1383. While we believe the Proposed Regulation Text as exists requires some clarity and flexibility to allow for alternative collection and processing methodologies, we certainly agree with staff that this is a good first step and would hope that with the complexity of the new regulations and the amount of questions that exist with this implementation, an additional 45 day comment period will be added so all parties can have their questions and concerns addressed.</p>	<p>Comment noted. CalRecycle circulated various iterations of the draft regulatory language for multiple comment periods consistent with APA requirements.</p>
2051	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Section 18984.5 determines how containers should be monitored for contamination on the daily routes. As this provision exists, there is a burden to monitor all routes, even those that have shown that they are consistently complying with the provisions of SB 1383. While we understand CalRecycle's desire to monitor all routes for compliance, we believe that this can be accomplished by looking at the load checks when materials enter the transfer or processing facility. We feel a small adjustment to this section can achieve CalRecycle's goals and keep the cost to jurisdictions lower. Would CalRecycle consider allowing section "C" of this provision (the review of materials at facilities) be the driver to determine which routes need auditing, and then follow the route audits as required in section "B?" This would allow auditors to focus on routes that are problematic instead of auditing high performance routes, thus saving jurisdictions money.</p>	<p>CalRecycle is providing flexibility to jurisdictions to determine routes and the number of containers to randomly select. Nothing prohibits a jurisdiction from also allowing drivers to identify routes that are problematic. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
2052	Adams, Tracy; GreenWaste Recovery, Inc.	<p>Though Article 9 is not called out in the agenda for this section, this does seem to be the place that this question comes into play. In section 18990.1 (b) (5), CalRecycle requires that "a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that do any of the following: (5) Require a generator to use an organic waste collection service or combination of services that do not recover at least the same types of organic waste recovered by a service the generator previously had in place." As an organic's processor, this provision is concerning as markets and ability to compost can shift, similar to the market shifts we have seen in the recycling markets. It is our premise that we must be able to adjust to shifting market conditions. For example, "compostable" single use food ware has become a relatively commonly accepted material in many organics' programs. Though these materials are accepted in the programs, the material will not break down in a commercially reasonable timeframe and become contaminants to the organic's program. Other materials that can vary by program include palm fronds and yucca. While we understand it is CalRecycle's desire to ensure that programs grow going forward, it is imperative that each jurisdiction can design programs that fit their needs, which includes the ability to adjust to changing technologies and markets. Without this ability, haulers will be required to accept contaminants into their program if previous haulers have allowed them.</p> <p>Would CalRecycle be amenable to either adjust or remove this section to allow for programmatic flexibility in the future?</p>	<p>CalRecycle is leaving this provision in place. Maintaining recovery services is important to keep the level of recovery consistent with the statewide goals. Requiring a generator to use a collection service that disposes of organic waste that the generator previously had collected for recovery would inevitably lead to increased disposal of organic waste, and would be an artificial barrier to the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions.</p>
6281	Aguinaga, G., Harvest Energy Holdings LLC	<p>CalRecycle, in its effort to implement SB 1383, must support both front end markets (organic waste diversion and recycling) and back-end markets through broad use of the recycled organics products both within the jurisdictions' procurement practices and outside of them. Recycling organic products can include methane gas for power production, for gas system injection, for transportation fuel, compost, mulch and other products.</p>	<p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. 			<p>gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p>
6282	Aguinaga, G., Harvest Energy Holdings LLC	<p>Harvest acknowledges and supports CalRecycle's effort to create a procurement program for jurisdictions; this will be an exciting new market within local governments for recycled organic products. However, as currently drafted, the proposed SB 1383 procurement section is very limited and only allows two recycled organic products to be considered out of many options that exist now, and more that may come to the fore in the future through technology advancements. We strongly suggest CalRecycle consider amending its draft regulation as it relates to the new procurement program to give jurisdictions a broad choice when procuring recycled organic waste products and not limit their options to compost and renewable gas transportation fuel.</p> <p>While we support a new procurement section in these regulations because this will provide financial incentives and opportunities for new AD infrastructure development, severely restricting a new procurement program is short-sighted and does not recognize the economic and industrial diversity within our state. =</p>	<p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. 6284	Aguinaga, G., Harvest Energy Holdings LLC	One of the most important signals that can be sent to developers is a clear message from the agency that the regulations will be implemented in a timely manner, meaning adoption of the regulations in 2019 imperative. The diversion statutes were passed in 2016. Achieving final adoption of the implementing rules will let the industry, especially technology developers and project developers, know the State is committed to developing a new AD market and that it is safe to continue investing in the projects.	Comment noted. The commenter is expressing an opinion on when the regulations should be finalized and approved.

Comment Number	Received From	Question/Comment	Response(s)
6285	Aguinaga, G., Harvest Energy Holdings LLC	The combination of a clear timeline and strong enforcement mechanisms will be critical for developers to secure the organic waste feedstock needed to continuously operate ADs, as well as to demonstrate market stability to secure the financing necessary to fund construction of new AD facilities in California. It is imperative that CalRecycle send a strong signal to the industry that the agency will implement the SB 1383 regulations effectively and on schedule.	Comment noted. The commenter is expressing an opinion regarding the need for strong enforcement and robust implementation of the final regulations.
6286	Aguinaga, G., Harvest Energy Holdings LLC	Given this level of needed lead-time, it is critical that CalRecycle implement the regulation as quickly as possible.	Comment noted. The commenter is expressing an opinion regarding the need to implement the final regulations as quickly as possible.
6287	Aguinaga, G., Harvest Energy Holdings LLC	As this initial wave of projects will provide crucial assets for the early days of regulatory implementation, it is important that industry be sent a signal from CalRecycle that their continued investment is warranted.	Comment noted. The comment does not suggest changes to regulatory language or the regulatory process undertaken by CalRecycle.
6288	Aguinaga, G., Harvest Energy Holdings LLC	Given these development risks, industry players are reluctant to enter into this process without a clear regulatory signal that a market will exist once they come out the other end.	Comment noted. The comment does not suggest changes to regulatory language or the regulatory process undertaken by CalRecycle.
6289	Aguinaga, G., Harvest Energy Holdings LLC	RE: Cal Recycle proposes the following language at Article 12. Procurement of Recovered Organic Waste Products (Page 27 of regulation): "Except as otherwise provided, commencing January 1, 2022, a jurisdiction shall annually procure a quantity of recovered organic waste products that meets or exceeds its current annual recovered organic waste product procurement target as determined by this article. For the purposes of this article, the recovered organic waste products that must be procured are: (1) Compost (2) Renewable transportation fuel" -- Harvest strongly suggests that CalRecycle consider including other organic commodities in the procurement requirement listed above. As we have discussed in this letter, these regulations will be sending a strong signal to the marketplace. With anaerobic digestion being a sector in its infancy, here in the US and especially California, it carries a level of risk and walks a delicate balance between an investable AD project and not. All potential forms of revenue must be allowed, including compost, mulch and all forms of methane to renewable gas for power production, gas system injection, transportation fuels, as a feedstock for renewable hydrogen and other potential uses that may be developed in the future through technology advances.	CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. Comment Number	Received From	Question/Comment	Response(s)
6291	Aguinaga, G., Harvest Energy Holdings LLC	<p>More specifically, the draft regulation restricts the procurement of organic waste derived fuel to renewable transportation fuel, hence a disincentive to the local government to build projects that can inject fuel into the natural gas pipeline. In 2018, the Legislature passed SB 1440 (Hueso) to direct the CPUC to develop a program to procure renewable natural gas, including such renewable gases that can be produced through anaerobic digestion. Since the passage of SB 1383, the Legislature clearly set new policy to support a broader renewable gas market. Therefore, these regulations are not aligned with statewide policies that support the deployment of renewable gases beyond the fueling station pump.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. 6293	Aguinaga, G., Harvest Energy Holdings LLC	<p>While it can be a challenge to create a new industry, in the case of organics recycling to renewable gas and deployment via pipeline injection, the distribution and delivery system to the gas pipeline already exists, the electric generation also already exists and hydrogen production also already exists - all of which can accommodate renewable gas, and all of which have current statewide programs and incentives to support these end uses. More specifically, CPUC regulated infrastructure and approved renewable gas injections standards are in place and able to accept biomethane today. CPUC BioMat tariffs are also in place and able to accept new power on the electric system. Local governments, like LADWP, also have extensive experience with handling and using renewable gas. Recycled organics to biomethane can immediately leverage the current gas systems and electric system, as well as the current fueling stations to effectively deploy products from AD facilities and bring success to California's SB 1383 goals.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. 6295	Aguinaga, G., Harvest Energy Holdings LLC	Alternatively, if Cal Recycle cannot simply allow for the procurement of any available organic commodity, then Cal Recycle should design a pathway for local governments to gain approval for the procurement of unlisted organic commodities. The precedent was already set for this method in Article 2 Section 18983.1 where CalRecycle allows for other, unlisted diversion technologies to apply, and qualify for a diversion facility determination by stating: (8) Other operations or facilities with processes that reduce short-lived climate pollutants as determined in accordance with Section 18983.2. Section 18983.2: Verification Determination of Technologies That Constitute a Reduction in Landfill Disposal, outlines a procedure for applying for qualification as a diversion facility. If a diversion facility qualifies under this provision of the regulation, then the procurement of commodities manufactured by these facilities should be encouraged by CalRecycle and local governments in the procurement requirements of this regulation.	CalRecycle disagrees with adding an option for approval of “unlisted organic commodities” for procurement. The broad range of potential recovered organic waste products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors.
2007	Ambroso, Jim; The Resource Management Group, Inc.	Definition of Self Hauler – the definition limits self-haul activity to that which is performed by the generator only. Our concern is with the reference to “back hauls” from plants to distribution centers or warehouses owned or operated by the generator. From our experience, much of the back haul activity taking place is done by other commercial haulers, not by the generator or the local franchise hauler. For example, one large retailer uses an efficient and carbon friendly method of moving organics to a processing center, by having suppliers bringing products to their stores actually haul the organics as a “back haul” to the food waste processing center. The	CalRecycle already responded to stakeholder comments on this issue during the informal rulemaking and revised Section 17402.5(c)(6) to accommodate this situation. CalRecycle also clarified in the FSOR that de-packaging can happen elsewhere as long as the ownership of the material remains with the distribution center or stores and there is no further processing of the material.

Comment Number	Received From	Question/Comment	Response(s)
		<p>haul is not done by the generator, rather their supplier. To require a waste franchise hauler transport this waste doesn't make sense primarily because the food waste is on pallets in gaylord boxes and should be hauled in a van trailer, not a trash truck. The most efficient and cost effective way to recycle the food from retailers is to have it done by using a van trailer. Traditionally, franchise haulers won't supply a trailer.</p> <p>Appreciate if you can please consider this comment by allowing for non-generator owned vehicles to provide back-haul services under this method of collecting organic food waste.</p>	
2069	Ash, Kelly; California Grocers Association	<p>"Grocery store": Removal of "convenience stores" from this definition all together or separating it from the "Grocery Store" definition and define it independently would be beneficial moving forward as they are typically not seen as interchangeable. If "convenience stores" remain within the "grocery store" definition, it would be advisable. to include other retailers like pharmacies, which have been known to partner with grocery retailers to sell fresh food</p>	<p>CalRecycle revised the definition of grocery store in response to this comment. The definition of grocery store was revised to no longer include convenience stores because convenience stores typically do not carry a full line of grocery items and most likely will not have the same amount of edible food available for food recovery as a grocery store would have. For this reason, convenience stores were removed from the definition of "grocery store."</p>
2070	Ash, Kelly; California Grocers Association	<p>"Inspection": The need for an inspection is duplicative of inspections already required for food safety requirements. Furthermore, many of our Members do not keep their records on each store site therefore, there would be no records to inspect.</p>	<p>Section 18981.2 specifies that a jurisdiction may designate a public or private entity, which includes local environmental health departments to fulfill its regulatory responsibilities. If a jurisdiction designated their local environmental health department to monitor commercial edible food generator compliance, then the inspections would not be duplicative. Rather the local environmental health department could add to their existing food facility inspections to verify that commercial edible food generators are maintaining records.</p> <p>In addition, if a jurisdiction designated their environmental health department to monitor commercial edible food generator compliance, then health inspectors could also provide guidance to commercial edible food generators about safe surplus food donation best practices and food safety requirements. Please note that SB 1383 does not include food safety requirements. Food safety requirements are established by the California Health and Safety Code and enforced by environmental and public health departments.</p> <p>Regarding the comment that many supermarkets and grocery stores do not keep their records on each store on-site, the expectation is that each store maintains its own records specific to the food recovery activities of that store, and that those records are made available to the jurisdiction upon request by the jurisdiction.</p> <p>CalRecycle would also like to clarify that the regulations specify that commercial edible food generators are subject to inspection, and since an "inspection" is defined in Section 18982 to include the review of applicable records, commercial edible food generators must provide jurisdictions with access to the records required under this section upon request by the jurisdiction. A failure to provide such access may be considered a failure to maintain records. Maintenance of and access to the records described in this section is critical for jurisdictions to monitor commercial edible food generator compliance as is required in Section 18991.1 (a)(3).</p>
2071	Ash, Kelly; California Grocers Association	<p>"Non-compostable paper" and "Paper Products": Our Members would like clarification on whether either of these definitions includes waxed cardboard.</p>	<p>"Non-compostable paper" includes, but is not limited, to paper that is coated in a plastic material that will not breakdown in the composting process." If a material does not breakdown into compost during the composting process it is non-compostable. It is CalRecycle's understanding that waxed cardboard is compostable and would fall within this definition. Waxed cardboard</p>

Comment Number	Received From	Question/Comment	Response(s)
			would also fall within the "paper products" definition, although local jurisdictions, through their own ordinances, may have stricter requirements than these regulations and may prohibit such products going into the blue container.
2072	Ash, Kelly; California Grocers Association	"Tier one commercial edible food generator": To streamline enforcement and reporting, this definition would be best to allow for regional variation in how these types of generators are categorized to align with the local County Environmental Health Department. (i.e. Food permit types for food markets: under 3,000 sq ft; 3,000 sq ft to 10,000 sq ft; over 10,000 sq ft)	CalRecycle revised the threshold for grocery stores in response to this comment. The threshold for grocery stores was increased from 7,500 square feet to 10,000 square feet. This change was made in an effort to have the threshold align with environmental health inspections of grocery stores, so that these generators can be more easily identified by the jurisdiction.
2073	Ash, Kelly; California Grocers Association	"Tier two commercial edible food generator": The term "on-site food facility" needs to be defined separately to provide clarity on its meaning and the thresholds for it. Would a hotel that only sells packaged food mean on-site facility? Would public schools that receive food from a district facility be considered? Addressing the specifics of this would be helpful.	CalRecycle would like to clarify that a reference to the term 'on-site food facility' is only used in the thresholds for the following tier two commercial edible food generators: local education agencies, hotels, and health facilities. The regulations specify that 'food facility' has the same meaning as in Section 113789 of the California Health and Safety Code. To clarify, if something meets the definition specified in Section 113789 of the California Health and Safety Code and is also permitted as a food facility by the local health department, then it is a food facility. Section 113789 of the California Health and Safety Code is already well established through use in the California Retail Food Code and CalRecycle has determined it to be appropriate for use in this rulemaking to avoid duplication, conflict, or confusion.
2074	Ash, Kelly; California Grocers Association	Organic Waste Generator Requirements: Requiring commercial business generators to provide organic waste and non-organic waste disposal containers that conform with the containers provided through the organic waste recovery service of their jurisdiction is unnecessary. Allowing aesthetic and design authority to remain with the generator, excluding compliance required signage and terminology, will ensure consumers and customers have a pleasant experience while maintaining proper disposal access. Additionally, teaching, training, and reminding employees of proper organic waste disposal is a better approach than prohibiting employees from misplacing it. Prohibiting implies consequences to employees, when teaching and training paired with periodic inspections of organic waste containers for contamination and any needed reminders resulting from inspection is a more effective approach.	CalRecycle has determined that the color requirements in the regulations are necessary for statewide consistency and encouraging widespread generator understanding of appropriate materials that may go in collection containers.
2075	Ash, Kelly; California Grocers Association	Food Waste Prevention: Moving upstream to prevent food from going to waste avoids GHG emissions across the food cycle from production to consumption in addition to avoiding landfill emissions when food goes to waste. Collective research shows that food waste prevention is the most impactful and least resource intensive strategy to reducing GHG emissions from food. For example, the EPA's Waste Reduction Model (WARM) demonstrates that source reducing wasted food prevents 3.66 MTCO <sub>2</sub> E per ton of food. Bay Area Air Quality District's consumption-based material inventory shows an average two tons of CO <sub>2</sub> e avoided per ton of food waste prevented. We recommend that CalRecycle provide an exemption from food donation that recognizes and rewards the upstream efforts of generators implementing food waste prevention practices.	SB 1383's statutory requirement is to recover 20% of currently disposed edible food for human consumption by 2025. The statute does not include any requirement for California to achieve a food waste prevention target. As a result, CalRecycle will not require commercial edible food generators or jurisdictions to prevent or source reduce the amount of edible food they generate. CalRecycle does however recognize that some commercial edible food generators could have types of edible food available for food recovery that are not desired by food recovery organizations or services. One example would be a generator having significant quantities of food that does not meet the nutrition standards of food recovery organizations or food recovery services. To address this issue, CalRecycle added language to the edible food recovery education and outreach section to require jurisdictions to annually provide commercial edible food

Comment Number	Received From	Question/Comment	Response(s)
			<p>generators with information about the actions that commercial edible food generators can take to prevent the creation of food waste.</p> <p>To clarify, this is not a requirement for commercial edible food generators or jurisdictions to source reduce the amount of surplus edible food they generate. This is an education requirement intended to help generators learn how they can prevent the creation of food waste. Providing this education is critical to help generators that struggle to find outlets for their currently disposed edible food comply with SB 1383’s commercial edible food generator requirements, as all tier one and tier two commercial edible food generators are still required to comply.</p> <p>Regarding the comment that CalRecycle provide an exemption from food donation that recognizes and rewards the upstream efforts of generators implementing food waste prevention practices. Adding a section for commercial edible food generator exemptions and de-minimis waivers to the regulatory text was not necessary. Adding a section for exemptions and de-minimis waivers was not necessary because the regulations are already structured so that many food facilities and food service establishments are exempt from compliance due to the smaller amounts of edible food they typically dispose. Only the entities identified as tier one and tier two commercial edible food generators are required to comply. Every other food facility or food service establishment that is not a tier one or tier two commercial edible food generator is exempt from SB 1383’s regulations.</p> <p>CalRecycle recognizes however, that some commercial edible food generators could experience extraordinary circumstances that could make compliance impracticable. To address this issue, CalRecycle revised Section 18991.3. Specifically, language was added to specify that a commercial edible food generator shall comply with the requirements of Section 18991.3 unless the commercial edible food generator can demonstrate extraordinary circumstances beyond its control that make such compliance impracticable. For the purposes of Section 18991.3 extraordinary circumstances are specified as (1) a failure by the jurisdiction to increase edible food recovery capacity as required by Section 18992.2, Edible Food Recovery Capacity. And (2) Acts of God such as earthquakes, wildfires, flooding, and other emergencies or natural disasters.</p>
2076	Ash, Kelly; California Grocers Association	Emergency Circumstances, Disaster and Emergency Waivers: Power outages require immediate need for quick disposal of food products in their packaging. An alternate “opt-out” requirement would allow for perishable grocery items to be expeditiously disposed of only in the most urgent situations.	<p>The regulations specifically state “extraordinary circumstances” are: (1) A failure by the jurisdiction to increase edible food recovery capacity as required by section 18992.2.; and (2) Acts of God such as earthquakes, wildfires, flooding, and other emergencies or natural disasters. The language “other emergencies” in this provision is intended to take into account other situations that are emergent in nature, and may not be commonly defined as “natural disasters,” but that are nevertheless outside the control of the commercial edible food generator and cause compliance to be impracticable. Please note, “other emergencies” includes business closure due to disease pandemics, and power shutoffs that are carried out specifically to protect the public’s safety (e.g. electric company schedules and carries out a preventative power safety shutoff to protect the public from wildfires).</p> <p>“Other emergencies” however, does not include equipment failure or power outages that are not a direct result of a natural disaster or carried out specifically to prevent a natural disaster (e.g. wildfire). Allowing any additional flexibility to the "extraordinary circumstances" provision in the regulations could result in a loophole for commercial edible food generators to avoid compliance with the commercial edible food generator requirements of SB 1383.</p>

Comment Number	Received From	Question/Comment	Response(s)
2077	Ash, Kelly; California Grocers Association	Regulations of Haulers: Throughout the rule making process, it is important to make sure that generators who self-haul are able to do so in an economical way for their business. Some of our Members may find backhauling as the most common sense way to manage their organic waste, while others may not. The need to maintain flexibility when it comes to the hauling of organic waste is imperative.	Nothing in the regulation prohibits a business owner from self-hauling their organic waste.
2078	Ash, Kelly; California Grocers Association	Record keeping requirements: It is reasonable to have commercial edible food generators keep a list of each food recovery service or organization that receives edible food, but Food recovery services and organizations would be better suited to report the type of food, frequency of service, and the quantity of food they collect.	<p>CalRecycle would like to clarify that recordkeeping and reporting are different. Commercial edible food generators are not required to report information to the jurisdiction. They are required to maintain records, which is critical for enforcement purposes. Without the recordkeeping requirements for commercial edible food generators, jurisdictions will not be able to verify if a commercial edible food generator is complying with SB 1383's commercial edible food generator requirements.</p> <p>Many well-established food recovery organizations and services already provide their donors with some form of receipt of donation that often has the amount of food donated. Many organizations do this to provide their donors with information that will help the donor if they intend on claiming any of the tax incentives offered for food donation.</p> <p>CalRecycle would also like to clarify that food recovery organizations and services are only required to report the total pounds collected from the commercial edible food generators that they have a contract or written agreement with pursuant to Section 18991.3(b) in the previous calendar year to one jurisdiction. Nothing in the regulations requires a food recovery organization or service to report the types of food, frequency of service, or donor names.</p>
2079	Ash, Kelly; California Grocers Association	Reporting: The amount of staff and volunteer time that would be required to document all the detailed aspects of food recovery take away from resources that could be used to meet the goals of the regulations. We recommend that CalRecycle reduce the number of reporting requirements and types of information required to what is necessary to determine compliance.	<p>CalRecycle would like to clarify that recordkeeping and reporting are different. Commercial edible food generators are not required to report information to the jurisdiction. They are required to maintain records, which is critical for enforcement purposes. Without the recordkeeping requirements for commercial edible food generators, jurisdictions will not be able to verify if a commercial edible food generator is complying with SB 1383's commercial edible food generator requirements.</p> <p>CalRecycle would also like to note that that many well-established food recovery organizations and services already provide their donors with some form of receipt of donation that often has the amount of food donated. Many organizations do this to provide their donors with information that will help the donor if they intend on claiming any of the tax incentives offered for food donation.</p>
2080	Ash, Kelly; California Grocers Association	In general, we strongly support the goals and intent of SB 1383 and appreciate the intent as we are committed to being good stewards of the environment, our neighbors, and for our communities. To that end, our comments are aimed at helping the Department create regulations that can be successfully implemented by Members. We look forward to continuing conversation with CalRecycle to work toward our common goals.	CalRecycle appreciates the support and also looks forward to continuing this work to achieve our common goal of keeping edible food out of landfills.
3627	Astor K., Heaton, S., Green, S., Helget,	Local Jurisdiction Mandate	Regarding authority to impose requirements on jurisdictions, SB 1383, in Public Resources Code Section 42652.5(a)(4) and (5), specifically allows the proposed regulations to "include different

Comment Number	Received From	Question/Comment	Response(s)
	C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	<p>The central concern we have is that the draft regulations take a draconian command and control approach that in our view is not workable for jurisdictions and is not supported by the language or intent of SB 1383. CalRecycle must develop regulations within the framework of state law. The implementing regulations should not exceed the authority granted in the law to the point that they are neither cost-effective nor feasible. SB 1383 set statewide organic disposal reduction targets of 50 percent by 2020 and 75 percent by 2025 to meet the statewide methane emission reduction goals for 2020 and 2025. The bill requires CalRecycle to adopt regulations to achieve the organic waste reduction goals, that may “require” local jurisdictions to impose requirement on generators or other relevant entities within their jurisdiction and may “authorize” local jurisdictions to impose penalties on generators for noncompliance. This bill was not intended to be a local jurisdiction mandate, however given the manner in which the regulations are structured and the inclusion of the enforcement and penalty requirements, the proposed regulations result in that effect. Instead of a detailed command and control approach, we strongly urge CalRecycle to provide an alternative approach that allows jurisdictions to develop their own programs and approaches to meet the performance goals, subject to reporting and oversight, similar to the way that AB 939 was originally implemented.</p>	<p>levels of requirements for local jurisdictions...” and may “include penalties to be imposed by the Department for noncompliance.” Regarding necessity, please refer to the Final Statement of Reasons.</p> <p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
3628	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	<p>To the extent that SB 1383 authorizes CalRecycle to require local jurisdictions to procure specific products beyond that already regulated by statute, we suggest the recovered organic waste products (compost and renewable transportation fuel) be expanded to allow procurement of other organic waste-derived commodities in the procurement program. We believe that choosing specific organic commodities for governments to procure puts CalRecycle in the position of choosing winners and losers and threatens innovation, as well as imposing mandates that may be mismatched with the needs of local communities.</p> <p>We recommend not restricting the procurement requirements at all, and instead allow the local government to decide, based on the technology available and products needed in their jurisdiction, which organic waste-derived commodity to procure. However, if CalRecycle cannot simply allow for the procurement of any available organic commodity, then perhaps the regulations could include a pathway for local governments to gain approval for the procurement of additional organic commodities (such as RNG procurement beyond transportation uses, mulch and bark), similar to the approach found in Section 18983.2, where unlisted diversion technologies may apply and qualify for a diversion facility approval determination. Additionally, and at a minimum, a process should be added to allow variances and</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>exemptions, so that communities that do not have demand for these products or that have an alternative way to meet them have a path to reach compliance.</p>	<p>recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p> <p>Regarding allowing an open-ended pathway for approval of unlisted organic products, CalRecycle disagrees with this approach for procurement. The broad range of potential recovered organic waste products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. As noted above, CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors.</p> <p>CalRecycle recognizes that, in some extraordinary cases, the procurement target may exceed a jurisdiction's need for recovered organic waste products. Section 18993.1(j) provides jurisdictions with a method to lower the procurement target to ensure that a jurisdiction does not procure more recovered organic waste products than it can use.</p>
3629	<p>Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County</p>	<p>Flexibility and Version of Good Faith Effort  Jurisdictions and their waste haulers need the flexibility to design programs based on a jurisdiction's specific needs and circumstances. That flexibility needs to include a grandfathering of facilities that have invested millions of dollars to comply with current laws and regulations. The regulations also need to include the ability of a jurisdiction to apply to CalRecycle for consideration of special circumstances specific to a jurisdiction that were not contemplated by these regulations. It is not possible to anticipate all the various scenarios that can occur in this diverse and complicated State. We also believe that a version of "good faith effort" is imperative to provide an avenue for successful compliance with the SB 1383 programs that are being developed. This approach has proven successful in determining compliance with the Integrated Waste Management Planning Act in nearly all jurisdictions across the state. While SB 1383 sets state targets, those targets can be achieved most efficiently and effectively through a state and local partnership and through the tailoring of programs to meet local needs.</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>

3630	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	<p>Section 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.7, 17409.5.9 and 17409.5.11</p> <p>Daily Sampling Requirements</p> <p>The daily sampling requirements for incompatible materials and organics portion of residuals are excessive since an alternative and random sampling protocol can be reasonably accurate and much more cost-effective.</p> <p>Recommendations: We recommend sampling occur within a one-week period on a quarterly basis and reporting on a quarterly basis rather than monthly. Operators can apply the percentages to daily outbound loads of processed organics and residuals to provide a reasonable estimate of the quantity of organic material that is recovered and disposed. This is particularly applicable to Source Separated Organics (SSO) since SSO loads will be significantly cleaner than mixed waste loads. Periodic sampling will be much more cost effective and will provide similar data to daily sampling, without the additional labor, space and time burdens.</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. The operator will now be taking composite samples for 10 consecutive days per reporting period, which is on a quarterly basis. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
3631	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	<p>17409.5.7 Transfer Processing Load Checking</p> <p>Daily load checking is excessive. Many of these loads will include materials in bags. Breaking bags from a load daily will require significant space and additional personnel. We recommend that random monthly load checks of each collection route will provide an adequate review for contamination. As we understand the regulations, a facility handling source separated organics must maintain a record of all loads with contamination that exceeds 10%. If the intent of these regulations is to encourage SSO, we believe that this threshold is unreasonable and unenforceable and should be deleted.</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations under 17409.5.7 in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
3632	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste	<p>3.10% Contamination Threshold – Incompatible Materials</p> <p>The 10% limit on incompatible materials is very confusing. First, the definition of incompatible materials was introduced in the 2nd Draft and we are still trying to understand the impact of this definition. Imposing a 10% limit on incompatible material and residuals appears to be a 90% organics reduction requirement and not the 50% and 75% requirement required by SB 1383. These 10% requirements may very well be a limit that is impossible to achieve in 2 ½ years, even with the best possible education efforts and with the addition of costly processing equipment. We strongly recommend that CalRecycle distribute a flow chart of both 10% requirements so that stakeholders understand the operational aspects of these requirements and the enforcement implications.</p>	<p>CalRecycle has revised this section to phase in the acceptable level. The change phased in the acceptable levels from 10 percent by 2022 to 20 percent on and after 2022 and 10 percent on and after 2024. This change was necessary to allow entities time to plan and make necessary adjustments to their operations. In addition, enforcement and penalties for non-compliance with the regulations do not go into effect until January 2022.</p> <p>The 50% and 75% are statewide targets. The incompatible material limit only applies when organics are being sent from a solid waste facility or operation to a secondary facility or operation for further processing. This is not a final recovery target. The incompatible material limit is to ensure the “cleanliness” of the organic waste separated from the source separated organic waste stream and mixed organic waste stream in order to ensure that the bulk of material sent out the</p>

	Management Assn Solid Waste Assn of Orange County		back end of a facility will be largely compatible with the type of facility that will be accepting it for further processing.  CalRecycle staff will develop tools to assist in the implementation of the regulations.
3633	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	<b>Long-Term Intermediate Landfill Cover</b> The regulations include a requirement of compacted earthen material at least 36 inches shall be placed on all surfaces of the fill where no additional solid waste will be deposited within 30 months to control methane emissions. Landfills already comply with the methane early action measure and we are not aware of any reports or data demonstrating the need for this requirement. We are also not aware of any cost/benefit analysis including the cost of additional generated truck miles and emissions that was completed for this requirement. This provision should be deleted and CalRecycle should initiate a comprehensive and scientifically-based analysis of intermediate cover and closure requirements. Any regulatory changes in those requirements should be accomplished in a focused work group setting to ensure that all impacts are properly considered.	CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments.
3634	Astor K., Heaton, S., Green, S., Helget, C., Kracov, G., Lynch, K., Mortinson, C., Moffat, J., and Westmoreland., E., Inland Empire Disposal Association, Los Angeles County Waste Management Assn Solid Waste Assn of Orange County	Again, we strongly urge CalRecycle to convene a working group with key stakeholders to discuss how the industry and local governments would propose to improve the SB 1383 regulations. We recommend that this working group be convened immediately and that it actively participates in the drafting of the next version of the proposed regulations.	Comment noted. The comment is not directed at the current regulatory language or regulatory process but is instead requesting CalRecycle convene a working group. Any subsequent rulemaking regarding SB 1383 would involve outreach and likely informal rulemaking discussions with affected stakeholders.
4404	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solic Waste Assoc', of Orange County	<b>INFRASTRUCTURE</b> To the extent the draft regulations would impose new performance or other requirements on materials recovery/recycling facilities (collectively "MFRs"), we object. As industry stakeholders have repeatedly commented, the existing network of recycling facilities which CalRecycle will now target was created in response to AB 939, and its demand for waste "diversion." These facilities are responsible for the vast majority of all reported waste diversion in this state.	Comment noted. This rulemaking does not impose affirmative recovery requirements on facilities - the requirements are on jurisdictions in how they route collected waste depending on the collection service model that is utilized. Solid waste facilities will not be subject to enforcement for not meeting recovery percentages.

Comment Number	Received From	Question/Comment	Response(s)
		<p>These AB 939 facilities are doing precisely what they were designed to do. Most are performing well. Many have been upgraded over the years to deliver even better results. Most have significant debt attached to them, as the operators borrowed tens of millions of dollars for their construction and operation. Every one of them contributes, to some degree, to municipal waste recovery and recycling efforts. One would hope that CalRecycle might simply embrace the singular contribution of this rather fragile network, and that it would follow the express instruction of AB 341 ( embodied in Public Resources Code Section 40004) by helping to "sustain and grow" these facilities as part of the effort to achieve the state's 75% diversion goal. Instead, CalRecycle has gone in the opposite direction and has chosen to regulate them even further.</p> <p>Regulation burdens the regulated entity. It imposes costs that may or may not be recoverable. In the case of mixed waste processing facilities, the regulations you now propose will mean their premature demise. SWFs tend to be privately financed, over terms ranging from 20-30 years, at a cost of several tens of millions of dollars each. We fear that when banks and other sources of financing are confronted with the possibility of new regulation that renders a facility obsolete long before it has been paid for, it will have a chilling effect, and thereby hamper the ability of borrowers to obtain new loans for upgrades to existing facilities, and/or new construction.</p> <p>These mixed waste facilities tend to process 100% of the solid waste stream, including material that is destined for disposal due to its high level of contamination. Many jurisdictions like a mixed waste system because of the cost and emissions savings it achieves (two-thirds of truck trips are eliminated). Many prefer it because of the difficulty they encounter in getting the public to separate waste from recyclables.</p> <p>In any event, material that otherwise (in a 3-stream collection program) would never have been processed is now sorted, and recyclable material is removed. Because everything is processed, the percentage of material that is recovered is always going to be lower than a source separated system achieves, because those systems don't measure (and never see) material that goes to a landfill. It is excluded from the calculation. On the other hand, with a mixed waste system it is often the case that more material is actually recycled, because more material is processed.</p>	
4408	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solic Waste Assoc', of Orange County	<p><b>ENFORCEMENT</b></p> <p>The proposed regulations also fall short in at least two other general areas. The first has to do with the fact that the year 2020 and 2025 benchmarks for achieving the required organics diversion of 50%, and then 7 5%, will not be met; the necessary infrastructure is nonexistent and cannot be supplied within these time frames. While this fact is universally acknowledged, the regulations do not address it. They should. They should provide an avenue for a local agency to obtain relief from any enforcement action for failure to achieve the required organics diversion level where it can demonstrate that the failure was due to a lack of adequate organics</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>processing capacity, a lack of markets, or to contamination levels that are the result of the generator behavior upstream that has not sufficiently corrected despite a thorough public education effort. And to the extent that CalRecycle intends to assert enforcement actions against solid waste enterprises such as haulers or facilities (our reading of SB 1383 itself raises legitimate questions as to that ability), this relief should also be made available to them.</p> <p>The relief we speak of is not some form of permissive waiver process where CalRecycle retains absolute discretion to either grant or deny relief; rather, we propose a process that is more or less 'self-executing,' one in which the relief is available without requiring that a formal request be filed by the local agency (or hauler), so long as it can demonstrate the existence of certain facts which are beyond its ability to control, such as a lack of processing capacity or markets.</p>	
4405	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc' of Orange County	<p>Proposed Section 17409.5.1 would require that at least 50% of the organic waste received from mixed waste collection efforts be removed by 2022 (less than 5 years from now), and that 75% be removed by 2025. These numbers are unachievable. No such technology now exists, as CalRecycle staff must well know. Purists---very few of whom have any actual financial risk or "skin in the game," have never liked these systems because the recycling they provide is largely unseen, and does not require direct consumer participation. Nevertheless, punishing these facilities for their inability to perform work or which they were never designed is inappropriate. Clearly, it neither sustains them, nor aids in their expansion, and to that extent is in conflict with the very law that created the 75% diversion goal.</p> <p>It is worth noting that imposing an unattainable organics recovery requirement on facility operators will likely lead some to actually dispose of certain, relatively contaminated loads that would otherwise have been processed, in order to improve/preserve their facility numbers. Is that really the outcome you intend?</p>	<p>Comment noted. The comment is vague but appears to suggest that CalRecycle must propose to not enforce aspects of the regulation if the organic waste recycling infrastructure capacity necessary to achieve the targets is not established by an undetermined date. It is unclear how a commitment not to enforce a regulation would help achieve the purpose of the regulation. These regulations, like all regulations, are designed so that compliance with the regulations will achieve the goal of the regulation. Enforcement is an essential aspect of ensuring compliance. Each aspect of the regulation is necessary to carry out the purpose of the statute. A commitment to not enforce a provision of the regulation would obviate the purpose or necessity of that provision. Additionally, as noted previously, the proposed regulations contain provisions in Section 18995.4 and 18996.2 allowing delayed enforcement of penalties for extenuating circumstances, including for organic waste infrastructure deficiencies.</p> <p>Under 18996.2, enforcement of penalties may be delayed for up to three years if the standards of that section are met.</p>
4406	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc' of Orange County	<p>CalRecycle has, itself, estimated that perhaps 100 new facilities will be required to process diverted organics, and that figure, to our knowledge, only addressed the impacts resulting from the passage of AB 1826 and its commercial organics recycling requirement. It is not clear that this estimate accounted for the loss of the ADC market, which involves more than 1.6 million tons of material that will suddenly be displaced. The ADC option, as is well known, has been particularly helpful to communities in Southern California that have nowhere else to deliver their material. Whether or not the 100 facility estimate accounts for AB 1594 impacts, new infrastructure to process the green materials formerly disposed as ADC has not been developed in an amount adequate to meet the anticipated need.</p> <p>Consider, as well, that it takes an estimated 5-7 years minimum to develop a waste recycling facility, and this assumes limited interference from air and water quality regulators, and cooperation from local government, an assumption that is overly optimistic if past experience is any indication.</p>	<p>Stakeholder comments regarding mixed waste processing facilities span a wide spectrum -- from allowing existing facilities to continue to operate even if they do not meet higher diversion standards, to establishing a waiver process for allowing such facilities to continue to operate for 10 to 15 years beyond the target dates in statute or the effective date of the regulations respectively. As currently written, the regulations allow some time for a non-compliant facility to come into compliance; i.e., at a minimum, it will be over 6 months after the regulations are in effect before sufficient information is available to determine whether a facility has been out of compliance for two consecutive quarters. When this is the case, then a NOV would be issued to the jurisdiction(s) using that facility, requiring compliance within 90 days. The department may extend this period to a total of 180 days, after which it may issue a Corrective Action Plan for up to 24 months. This means that it will be at least 2 and possibly 3 years after the effective date of the regulations before the jurisdiction is not allowed to use a non-compliant facility. This would give facility operators several years in which to make necessary operational changes to come into compliance.</p> <p>During the informal rulemaking period, CalRecycle responded to many stakeholder requests for additional flexibility to allow these mixed waste facilities to continue operating beyond the</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>effective fate of the regulations. As noted in the ISOR, Sections 18984.2 and 18984.3 allow alternatives to providing a three-container source-separated organic waste collection service. Under these sections, jurisdictions are allowed to require their generators to use a service that does not provide generators with the opportunity to separate their organic waste for recovery at the curb. To ensure that the state can achieve the statutory organic waste reduction targets, these collection services are required to transport the containers that include organic waste to high diversion organic waste processing facilities that meet minimum organic content recovery rates (content recovery rates that are specified in Section 17409.5.1. While there is a lack of data demonstrating that organics can be effectively separated from other materials and still be recovered at a rate necessary to meet the statutory targets, a significant portion of stakeholders argued that such technologies are in development and should not be stymied by this regulation. To respond to stakeholders, Sections 18984.2 and 18984.3 provide the flexibility requested and lay out minimum standards for two-container and unsegregated single-container organic waste collection services.</p> <p>Regarding the proposed exemption for one facility, CalRecycle disagrees in principle with the concept of carving out exemptions for specific facilities or specific jurisdictions on the basis of regulatory criteria that only fit that situation. If CalRecycle allowed this for one facility or one jurisdiction, then there would be no justification for not allowing similar proposals. This effectively invalidates the ability to create an even playing field with a single statewide regulation designed to achieve a statutory target. This could result in an unknown but conceivably large number of facilities and jurisdictions being exempted, with associated negative impacts on the ability to reach the mandated statewide organics disposal reduction goals.</p>
4407	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc' of Orange County	<p>As we have commented twice previously, we believe CalRecycle's effort in this regard to be both sincere, and seriously flawed. Your focus is completely misplaced. Further constraining the operation of existing facilities, and consequently the private sector's ability to site or operate such facilities, will not solve the problem. Once again, we respectfully urge that you shift away from imposing performance standards on the AB 939 network, and turn instead toward establishing regulations that will encourage the development of a new SB 1383 network, one specifically designed to address the organics recycling and composting objectives of that law. If "performance" must be considered at all, it should be reserved for---and limited to--- instances involving new facility development, or retrofitting existing facilities, and should be structured as an incentive, rather than as a punishment or sanction. AB 939 is still the law, and those facilities contributing to meeting the requirements of that law and should be left to do their job unmolested.</p>	<p>Performance standards are not imposed on facilities and those facilities are not subject to enforcement for not meeting recovery standards. Affirmative regulatory requirements are instead placed on jurisdictions in terms of how they route solid waste depending on the collection model that is implemented.</p>
4409	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>There are no markets available in Southern California to fully absorb this flood of processed organics. We know this now. Even assuming it could all be safely and properly processed, if there is no place to sell the material, what then? Shall we just dispose of it? SWF permits contain strict limits on the permissible amount of material that can be stored on site, so temporary storage on site, as an option, is of very limited value. Because we are speaking here of organic material rather than plastic, fibers or other comparatively inert recyclables, with large scale storage one</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383</p>

		must also consider the likelihood of unwanted side effects such as odor or emissions issues, which can prevent facilities from even operating.	furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
4410	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	Finally, the way in which these regulations address the markets issue, and the related enforcement issue, will have direct and profound franchise implications. Already, in anticipation of the draft regulations becoming final, at least one municipal solid waste consultant is advising its clients to force their service provider to offer SB 1383 indemnification. Consultants often seek the easy way out by encouraging a shift of the entire compliance burden to the private sector, but increasingly, local governments are seeing through this tactic and are recognizing that collectors/processors cannot influence global recycling markets, and have very limited ability to influence upstream/consumer behavior. As a result, waste franchise agreements have recently been trending away from arbitrary or fixed recovery percentages, and toward compliance that is program based, not unlike CalRecycle's own approach to communities placed under an AB 939 compliance order.	Comment noted. Franchise agreements are beyond CalRecycle's regulatory authority and are left to local control under the Public Resources Code
4411	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	The draft regulations unnecessarily target haulers and facilities for much of the SB 1383 compliance burden, despite the fact that the underlying legislation does not. The regulations make no allowance for the fact that the bill's timetable is unrealistic, its costs are astronomical, and neither local government nor the waste recycling industry can foresee any way to meet the requirements. To simply move forward and publish regulations that do not address these foundational issues is, in our view, rather short-sighted.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.
4412	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	A primary area of concern has to do with the sheer amount of information (termed "data points" in your handout) that CalRecycle is now seeking. As CalRecycle staff is aware from our involvement with the AB 901 regulatory process, from the hauler's perspective it is vital that the proprietary and confidential nature of much of that information be protected from public disclosure---whether by local government, an enforcement agency, CalRecycle, or any other state agency with whom the information may be shared. Some of our concerns in this regard have been allayed, at least in part, by draft language that your legal office has shared, but until such time that adequate protections are built into the regulations, we remain justifiably concerned.	CalRecycle changed the requirement for a "written report" to a "written record" in 18995.1(c) to make clear that information gathered during inspections such as route reviews and compliance reviews is not required to be disclosed in a public report. These are written records that are to be maintained in the files of the local jurisdiction. To the extent that such information is valid confidential, proprietary, or trade secret information, there are protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow the appropriate withholding of such information from public disclosure by the jurisdiction.

Comment Number	Received From	Question/Comment	Response(s)
		<p>If the information is accessed by CalRecycle as the result of an audit ( the process by which the contents of reports to CalRecycle are to be verified), AB 901 itself affords to the information owner a right to aggregate the data, and also offers some basic protection against public disclosure. However, information submitted in the form of a report to CalRecycle does not yet enjoy the same level of protection.</p> <p>At the same time, the mere fact that information may be protected from becoming a public record does not mean that my clients are anxious to share it with you, or that it is a good idea that government possess the information in the first place. Information that is exempt from public disclosure can still be misused.</p> <p>Accordingly, we respectfully urge that CalRecycle follow a "sustainable" approach to its information gathering mission: (i) collect no more than you absolutely require (in other words, no more than the underlying statutes specifically authorize), (ii) protect the information from public disclosure, and (iii) limit your use of the data to only those purposes specifically expressed in SB 1383. That legislation was not an invitation to collect data for the sake of data collection, or to pursue unrelated policy goals or objectives.</p>	
4413	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	At this juncture, the associations have no preference in terms of where they report--directly to local jurisdictions, or to CalRecycle; their ultimate answer will depend on how the draft regulations are written. The use of current databases as reporting mechanisms is acceptable as long as trade secret and confidential or proprietary information receives appropriate protection from disclosure.	CalRecycle changed the requirement for a "written report" to a "written record" in 18995.1(c) to make clear that information gathered during inspections such as route reviews and compliance reviews is not required to be disclosed in a public report. These are written records that are to be maintained in the files of the local jurisdiction. To the extent that such information is valid confidential, proprietary, or trade secret information, there are protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow the appropriate withholding of such information from public disclosure by the jurisdiction.
4414	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	Reporting on contamination is a potential area of concern. We are already on record in opposition to the use of standards to rate recycling facility performance. Measuring contamination at the front or back end of a MRF can result in data that may be used against the operator even though it has nothing to do with the quality of the facility. We know from experience that a facility which is located in, or serves, an economically disadvantaged community will see very high levels of contamination in the single stream materials, despite robust public education efforts. We also know that while contamination is increased where mixed waste systems are used, the net increase in the amount of material that is processed and recovered in these systems more than compensates for any effects of higher front-end contamination.	Comment noted. Comment is not commenting on the regulatory language.
4415	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	We want CalRecycle to collect only the minimum amount of information it needs to comply with statutory requirements, and have significant concerns about how the data you are collecting for SB 1383 purposes may be used in the future.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.

Comment Number	Received From	Question/Comment	Response(s)
4416	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	it is vital that all "haulers" be regulated and treated alike, so that the burden of these regulations does not apply only to those identifying themselves as solid waste enterprises. Many jurisdictions have underground (illegal, unauthorized) haulers that are somehow able to elude local enforcement efforts. The more CalRecycle seeks to regulate and control legitimate hauling operations, the greater is its obligation to find ways to discourage illegal waste hauling or recycling activity. Basic fairness requires as much, to say nothing of the public health threat associated with illegal hauling/recycling.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.
4417	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	Our members accept that there may be a need to monitor waste generator compliance or participation rates; they do not wish to have any significant role in enforcing compliance. The exact relationship between waste hauling/recycling and edible food collection is unclear. Based on experience, however, we do fear that illegal waste hauling/recycling will increase under the guise of edible food recovery, and urge that very strict and enforceable standards be written to regulate the recovery of edible food, for the obvious public health reasons.	The regulations already include enforceable standards to ensure that 20% of currently disposed edible food is recovered for human consumption by 2025. Please note that SB 1383 does not include food safety requirements as food safety requirements are already specified in the California Health and Safety Code and enforced by environmental and public health departments.
4418	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	On the issue of generator exemptions, this is an area where there may be actual value in having the state evaluate the potential benefit of mandatory service. The idea that a resident or business can simply fail to subscribe to trash service, or easily opt out of a mandatory service requirement, is archaic at best. This is an essential public service not much different in importance than utility service or police and fire protection, yet nobody would argue for the right to selectively opt out of paying for those services.	Comment noted. The specific language requiring automatic enrollment within 30 days was removed from the final text. This text was replaced with clarifying language specifying that jurisdictions must provide collection service to their generators subject to their authority consistent with provisions of Article 3. This text, importantly, still requires jurisdictions to provide mandatory organic waste collection services to all of their generators. Mandatory service is required to ensure the state's ability to achieve the statutory organic waste reduction targets. Under existing law (AB 1826, Chesbro, 2014), certain commercial businesses are already required to subscribe to organic waste recycling services and jurisdictions are required to offer organic waste recycling to those businesses. However, that law does not currently require jurisdictions to mandate subscription to service or require them to take enforcement against businesses that fail to obtain service. The state is not authorized to take enforcement against businesses under AB 1826. The vast majority of jurisdictions have chosen not to mandate service. These jurisdictions reported that fewer than 25 percent of their businesses are in compliance with existing organic waste recycling requirements. Compliance levels in jurisdictions that lack enforcement mechanisms reveal that failure to include mandatory jurisdiction oversight and enforcement in the regulation is incompatible with the state's ability to achieve its organic waste reduction and climate change goals.
4419	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	We have absolutely no desire for CalRecycle to collect information (or attempt to influence in any manner local decision making) on the method of hauler regulation, and/or local rates. CalRecycle is overreaching by even seeking input on whether it should collect this form of data. Association members report a measurable increase over the past 12-18 months in terms of CalRecycle's activity level with local government. Your staff is already seeking data never before reported to the state by claiming it is required under AB 341 or AB 1826. In some instances, SB 13 83 is cited as the reason, despite the fact that the regulations have yet to be written. Growing the state's role in matters traditionally reserved for local determination is not wise. AB 341 itself acknowledges this fact. We urge restraint here. Calrecycle has no	No change to the regulatory text is necessary. The commenter is expressing an opinion, which is noted.

Comment Number	Received From	Question/Comment	Response(s)
		business involving itself in rates or methods of hauler authorization; as state law has expressed for more than 40 years, these are "aspects of solid waste handling that are of local concern."	
4420	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	if this is a precursor to CalRecycle asserting a more direct role in the formation of franchise agreements, then we are very much concerned, and would expect local governments to be equally alarmed.	CalRecycle does not have authority to directly regulate franchise agreements.
4421	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	entirely too much emphasis is being placed on how to manage or further regulate MRFs and other SWFs, and not enough emphasis is being focused on the issues that really matter: where to find the additional capacity to process organics, where to market the resulting product, and how best to reach waste generators and consumers to bring about the necessary change in behavior that will be required.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
4422	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	What is most needed now is a shift in direction, away from further regulating the regulated, and toward creating incentives that will stimulate new facility and domestic market development.	Comment noted. CalRecycle has adopted requirements within the scope of its regulatory authority that are necessary to achieve the statutory reduction targets. CalRecycle has sought to build incentives and performance based alternatives into the reg wherever feasible.
4423	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	One reason why we do not now have a larger inventory of these facilities is precisely because of the obstacles that government, perhaps unwittingly, places in their path. Despite this, your Slide 3 7 asks whether LEAs should have, as part of SB 13 83, new facility standards added to the existing suite of state minimum standards. Of course not. Rather, LEAs and others should be given tools to streamline the permitting and approval of these facilities, so that more emerge.	CalRecycle has noted the comment. This is not within the scope of the rulemaking. However, EA's should consult with their CalRecycle Permitting Point of Contact for any resources required for permit actions.
4424	Astor, JK, LA Co. WMA, Inland	The very same 2011 legislation (AB 341-Chesbro) that established the commercial recycling requirement in state law, and the state policy goal that not less than 75%	The regulations do not place recovery standards that are enforceable against facilities.

Comment Number	Received From	Question/Comment	Response(s)
	Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>of solid waste be recycled or composted, also includes an often overlooked provision which created Public Resources Code Section 40004. There, this network of facilities is mentioned for its "net environmental benefit to the communities served," and it is described as a "valuable asset and resource of this state," one that "must be sustained and expanded" in order to achieve the state's additional diversion and recycling objectives [emphasis added].</p> <p>To the extent that the Draft Concepts would impose unrealistic performance "standards" or other requirements on individual recycling facilities, or even specific types of facilities, they are in direct conflict with PRC Section 40004. Placing undue burdens on these facilities neither sustains them, nor aids in expanding the network. Obviously, SB 1383 does not represent, either explicitly or by implication, a repeal of Section 40004. Accordingly, the two laws must be harmonized.</p>	
4425	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>Many existing facilities (including, but not limited to, mixed-waste processing facilities) were developed using what was, at the time, "state-of-the-art" technology. Many were only designed to deliver compliance with AB 939. Financing terms for their construction can run upwards of 30 years, so many have not yet been fully paid for. Any regulatory effort, however well-intentioned, that has the effect of penalizing these facilities because they do not yet meet a standard for which they were never designed places the operator in an impossible position, to say nothing of the chilling effect it will have on future facility financings.</p> <p>Against this background, we would prefer to see the Draft Concepts be revised to eliminate consideration of performance standards or requirements, and to emphasize more the specific steps you propose for incentivizing new facility development.</p>	The regulations do not place recovery standards that are enforceable against facilities.
4426	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>Another area where we would like to see greater emphasis in the Draft Concepts is in regard to marketing organics. Even if, by some miracle, we were to suddenly identify the additional processing capacity that is truly needed to manage an additional several million tons of organic material annually, no one has yet answered the question of where we will find markets to accept the processed organics. And, to the extent that the Regulations would discourage existing practices such as the land application of chip and grind material by treating it as "disposal," this only serves to exacerbate the problem.</p>	The regulations include procurement requirements intended to drive end use markets for processed organic waste.
4427	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>An honest appraisal of the state of organics markets in Southern California leads to the unavoidable conclusion that land application must represent a viable option, and must not be equated with "disposal." We are not opposed to reasonable regulation regarding the quality of material applied to the land, as long as the standards are practical and achievable. But the application to land of organic material that meets reasonable specifications must not be equated with or regulated as a disposal activity.</p>	<p>Comment noted. The Appendix to the ISOR includes a regional variation analysis which considers the potential for the economic impacts to vary by region. The Appendix to the ISOR notes the following regarding Southern California jurisdictions, "This analysis shows that these Southern California counties may incur a higher portion of the cost on a per capita basis. The potential for economic impacts to vary by region is in alignment with recent findings in rate surveys performed in 2018 as a part of a study under contract for CalRecycle. The surveys found that existing service rates in Southern California are notably lower than the statewide average..."</p> <p>The statement that Southern California jurisdictions may incur a disproportionate impact appears to rest on the argument that there is less organic waste recycling capacity in southern California and there are fewer jurisdictions in Southern California that provide organic waste recycling</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>collection services. CalRecycle also acknowledges this in the Appendix in the ISOR which includes the following note:</p> <p>A business that is located in a jurisdiction that already implements a majority of the requirements of the law likely already pays a higher rate for waste collection services than businesses located in jurisdictions that do not provide these services. These businesses may experience more modest rate increases compared to businesses located in jurisdictions that do not provide any, or only provide a minimal amount, of the additional services required by the regulation.</p>
4428	Astor, JK, LA Co. WMA, Inland Empire Disposal Assoc'n, Solid Waste Assoc', of Orange County	<p>If these regulations are written in a manner that has the effect of encouraging the self-hauling of organic wastes, we fear that neither state nor local agencies are equipped to properly oversee and administer that new activity, with the result that public health will suffer. In any case, we prefer to see such matters addressed and regulated locally, by the city or county with jurisdiction, rather than by the State. And, wherever self-hauling is permitted, it should be accompanied by robust controls to ensure that the material was actually generated by the hauler, was safely transported, and was properly recycled or disposed of. Anything less creates the potential for an imminent and substantial threat to public health and safety, with the attendant costs, risk of litigation, and pressures upon municipal budgets.</p>	<p>Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.</p>
4395	Baker, D ReSoil Sacramento/Green Restaurants Alliance Sacramento	<p>As a community composter in Sacramento, and one of hundreds across our Country, I want to encourage you to support "community-scale" models of composting. By doing so, you will enable communities to take action on building their own sustainable food systems and climate-resilient landscapes. All with the use of local "waste" resources.</p> <p>Community composting is arguably the "highest and best use" for these organic resources. Building healthy soil directly in the community or neighborhood where the food scraps are produced enables organic matter to provide many environmental benefits to that community. It enables resources that stay in the city or town to address flooding, drought, nutrition, hunger, biodiversity, lack of natural environment, and the urban heat-island effect.</p>	<p>Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.</p>
6216	Ball, J., CA Biomass Energy Alliance	<p>Biomass power plant revenue comes from electric ratepayers around the State who are paying for the facilities' renewable electrons and some of its environmental benefits. The biomass power industry has additionally been acting as a landfill diversion tool without compensation for that service. This is problematic in the energy markets for several reasons. Biomass power must compete for contracts with other renewable technologies that will bid in lower costs due to economies of scale and excess government subsidies that are not available to biomass. Biomass facilities still and will always have additional costs associated with managing and moving its fuel, making contract renewals elusive for in the industry. These market conditions have resulted in the closure of 15 biomass power facilities over the last 10 years. When California loses a biomass plant due to an expired contract, 230-270 thousand tons/year of excess wood are left stranded.</p>	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>CalRecycle can reverse this trend by amending the Organic Waste Reductions Proposed Regulation Text to allow a local jurisdiction to comply with its Recovered Organic Waste Product Procurement Targets by procuring bioenergy. Section 18993.1(f) of the Proposed Regulation currently only directs local jurisdictions to procure compost and renewable transportation fuel. Subdivision (f) should be expanded to include renewable electricity that uses excess wood that would otherwise be landfilled. Local jurisdictions that would most benefit from this expanded option would be those with electricity procurement responsibilities through a municipal electric utility or a community choice aggregator. By procuring bioenergy electricity, a local jurisdiction would be able to comply with both its renewable electricity procurement goals and its organic waste reduction goals. For the first time, the dual function of a biomass facility would be shared by both electric ratepayers and waste management ratepayers of a local jurisdiction. Allowing a local jurisdiction to use biomass conversion as a compliance opportunity is a good thing and CBEA supports its continuation (18983.1(b)(4)). In its current incarnation, the regulation is doing nothing to ensure this valuable infrastructure continues to be available to divert excess wood and does nothing to ensure new community sized biomass facilities get built. This simple change would, for the first time, marry electricity procurement with organic waste management and remove a cost-barrier electric ratepayers aren't obliged to or willing to cover.</p>	<p>on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel. CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>
6217	Ball, J., CA Biomass Energy Alliance	<p>Add a new definition:  "Renewable Electricity" is electricity which is generated from diverted organic waste using anaerobic digestion or conversion technologies consistent with Public Resources Code section 40106.</p>	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity.</p>

6484	Balsley, R., StopWaste	In Article 3, since multifamily properties are included in the definition of "commercial business," I'm concerned with the assumption that multifamily properties and businesses can be treated the same with generator requirements and associated enforcement, particularly in regards to inspecting for organics in the	Comment noted. The regulations do not require inspection of private residences.

Comment Number	Received From	Question/Comment	Response(s)
		<p>garbage and garbage in the organics and provision of organics and recycling containers in all areas where disposal containers are provided. Our Ordinance acknowledges that a property owner or manager at a multifamily property does not have contro1 over the sorting behavior of their tenants and we only enforce against a lack of provision of service. There is also a higher expectation of privacy in residential settings. Early in our Ordinance enforcement, we attempted to inspect multifamily properties to verify provision of service and found that nearly half the time, we couldn't get to the hauler bins due to access issues.</p>	
6485	Balsley, R., StopWaste	<p>Our Ordinance provides for the granting of waivers for De minim us generation, physical space constraints, financial hardship if the costs will be more than 30%, emergency conditions and unavailable service. The draft 1383 regulations language that requires annual verification of these waivers divert inspection/staff resources to these smallest generators from the more important larger generators.</p>	<p>CalRecycle has revised the verification period to five years in response to this comment.</p>
6486	Balsley, R., StopWaste	<p>As it pertains to self-hauler requirements in Article 7, in our Ordinance implementation, we require businesses that self-haul, back-haul, share service or use a third-party independent recycler, to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. We have over 400 accounts that we've approved for this alternative recycling collection. While some are larger corporate entities, many are small businesses that are trying to save money on collection costs by either taking their small amount of generated recyclables home or to a drop-off recycling facility. The requirement to collect annual source separated organics waste tonnage data from smaller businesses would not be possible from those that aren't keeping track of weights in back-hauling and is not worth the staff resources to try and track down.</p>	<p>Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements.</p> <p>Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(b) to include all education requirements for single unsegregated collection systems.</p>
6487	Balsley, R., StopWaste	<p>Over time, we've honed our commercial inspection time to be on average about 15 minutes per site (not including the time by other staff to review and process the inspection results), but this is only because many times the inspector only needs to look through the hauler serviced bins that ate outside in publically accessible areas. Having to go into a business to verify that appropriately labeled indoor containers are in all areas and that education has been provided to employees annually would mean significantly more time needed per inspection and increased access issues. In our Ordinance enforcement, we determined that the inspection at the hauler-serviced bins was where it is most effective to see whether proper sorting was occurring and if a generator was properly sorting their materials, it shouldn't matter if they don't have color-coded bins or extensive signage. Penalties that indicate that CalRecycle can. fine jurisdictions if they don't enforce against generators indoor container specifics are inappropriate.</p>	<p>CalRecycle has revised section 18995.1(a)(1)(A) in response to this comment. Section 18995.1(a)(1)(A) has been revised to state that a jurisdiction shall determine compliance with the organic waste generator requirements set forth in section 18984.9(a). The clarification was added by adding the (a) to exempt jurisdictions from the requirements in subsections (b) through (e) of section 18984.9.</p>

Comment Number	Received From	Question/Comment	Response(s)
6488	Balsley, R., StopWaste	<p>The current requirement to submit a massive amount of data for the January to June 2022 time period within one month of the end of the period is not doable. Our processing of citations sometimes has a 6 to 8 week lag.</p> <p>Also, many reporting provisions in franchises do not have that quick of a turn-around. Furthermore, in our MRO implementation, we regularly convey information about the enforcement and technical assistance activities that we conduct in our member jurisdictions, but to have to transfer copies of all inspection data, photos and copies of enforcement letters sent so that a jurisdiction is the sole holder of the Implementation Record would require massive data management systems that don't in and of themselves don't do anything to make progress on diverting organics from the landfill. We request that if a jurisdiction is designating another entity, such as us, to be responsible for major components of the requirements that they also be able to designate that entity as the holder of that portion of the Implementation Record. I also want to really encourage CalRecycle to think about how the massive amount of reporting data that's currently required is going to take away from the resources that could be used to affect behavior change and what's really needed to show that a jurisdiction is making the appropriate progress toward the statewide goals.</p>	<p>A change to the regulatory text is not necessary. CalRecycle has revised section 18994.2 in response to this comment. If a jurisdiction submits its initial compliance report pursuant to section 18994.1 by April 1, 2022, a jurisdiction may submit its first report, covering the period of January 1, 2022 through June 30, 2022, on October 1, 2022. The Department will conduct a mid-year review (6 months) of the jurisdiction's compliance and implementation with the requirements of this Chapter. This will allow CalRecycle an opportunity to assist jurisdictions in the implementation phase of the regulations. Most of the information required in the Annual Reporting can be assembled prior to the October 1, 2022 due date. The following Annual Report will cover January 1, 2022-December 31, 2022 and will be due August 1, 2023.</p> <p>A change to the regulatory text is not necessary. A central location for the implementation record is necessary to allow for timely, convenient and certain access to records and the proposed regulations state that jurisdictions are to provide access. If the record is under the control of a separate entity, the jurisdiction cannot provide that access.</p> <p>A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.</p>
6456	Barnes, K., City of Bakersfield	<p>The question of whether simple plastic bag barrel liners and food wrappers will be prohibited from organic containers in three-container systems. It is evident that food waste diversion programs with bags and wrappers divert more than those without by an order of magnitude. If the final regulations fully prohibit these items, it will not only retard CalRecycle's progress toward the goal; it will impact several of the largest existing food waste diversion programs in the state. We therefore urge CalRecycle to follow a universal principal found in most environmental regulations - the allowance of an effective alternative to prescriptive standards. In the case of the proposed SLCP regulations, one effective alternative could be the allowance of plastic bags and food wrappers if the composter can handle them and still meet CalRecycle's compost quality standards. As a jurisdiction, hauler, and composter that has achieved this high level of accomplishment, we say from experience that it would be counterproductive to follow the proposed regulations as they are written. Our effective diversion system is convenient for users, and it would make no sense to ban wrapped food or the use of plastic barrel liners through a costly inspection and enforcement system. In time, we are certain that more and more composters will rise to this level as they gain experience. Please enable this transition by not limiting the options.</p>	<p>The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility's normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The</p>

Comment Number	Received From	Question/Comment	Response(s)
			notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.
6457	Barnes, K., City of Bakersfield	<p>The consumption of excess fuel for diminishing returns on waste diversion. As a hauler with very solid and productive commercial food waste collection routes, we have determined that some generators are simply too small or too far from the core route to warrant the truck fuel to drive to them for separate types of collection. This is illustrated in the enclosed charts (one for diesel trucks and one for LNG trucks). Unfortunately, it seems as though the proposed regulations will "save global warming no matter how much fuel has to be burned". We caution CalRecycle to consider that the resulting system might not be the best in terms of transportation pollutants or overall energy consumption. Please enable the stakeholders to consider the overall welfare of the community by allowing some sort of exemption for excessive fuel consumption.</p>	CalRecycle has already provided for waivers related to low population. These waivers will address the issue of collection distances and thus excess fuel consumption.
6458	Barnes, K., City of Bakersfield	<p>Page 6, Section 18982(a)(55) and page 10, Section 18984(a)(1) and other related sections - The definition of "prohibited container contaminants" and terminology "organic waste only and not nonorganic waste" seem to prohibit plastic bags and plastic wrapped food waste from being placed in the organic collection containers of a three-container system. This will cause food scraps to stick and build up a thick layer in the organic collection containers. Food establishments will therefore undoubtedly refuse to place loose, un-bagged, food scraps in their organic containers due to sanitation needs and to avoid the labor of scraping and rinsing the containers after every collection event. Therefore, a solution is needed. One possible solution is the use of biodegradable plastic bags plastic bags for lining organic waste receptacles for customers as well as those in the back of the house at food establishments. However, this is problematic for three reasons.</p> <ol style="list-style-type: none"> <li>a. Bags of heavy moist food scraps burst easily after being in storage, due to inherent limited shelf life of biodegradable plastic bags.</li> <li>b. Biodegradable bags cost roughly 7 times the price of regular plastic bags for barrel liners.</li> <li>c. Bio-bag production consumes large amounts of cornstarch, creating a larger GHG output outside of California.</li> </ol> <p>Therefore, flexibility is needed to enable organic waste diversion systems to collect organic waste contained in plastic food wrappers or plastic bag barrel liners, provided the organic processing facility used by the system can meet CalRecycle's Title 14, section 17868.3.1 regulation for compost quality.</p>	<p>The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility's normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility. It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome. If the material cannot be recovered at a composting facility, it is technically inaccurate to identify the material as compostable. Compostable plastic liners that cannot be recovered and must be removed as a contaminant are functionally equivalent to plastic bags and would be viewed as such. Plastic bags are allowed under Section 18984.1(d).</p>

Comment Number	Received From	Question/Comment	Response(s)
6459	Barnes, K., City of Bakersfield	Page 13, Section 18984(a) through (d) - If plastic barrel liner bags are allowed for the reality of needing to keep organic collection containers clear of scum and build up in a three-container system, work is needed on to enable visual inspection of the organic wastes. One potential method is to use clear plastic bags rather than opaque colored bags.	<p>The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility's normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.</p>
6460	Barnes, K., City of Bakersfield	Page 13, Sections 18984.5 and 18984.6 – CalRecycle already controls compost quality through Title 14, section 17868.3.1. Compost cannot be sold or given away unless 99.5% free of manmade contaminants and 99.9% free of plastic film over 4 mm in size. Several major organic processing facilities currently produce and market compost meeting this standard using organic feedstocks still packaged in various types of material, and generally collected in plastic bags. To avoid unnecessary cost and to place effort on productive program promotion, these sections should only apply to those systems (made up of jurisdictions, haulers, and facilities) which are not compliant with Title 14, section 17868.3.1. Or more simply, those systems meeting Title 14, section 17868.3.1 should be exempt from these sections. Systems that expend time and resources on the futile battle of policing containers will be able to spend less on actually improving the compost process and increasing diversion.	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6461	Barnes, K., City of Bakersfield	<p>Page 15-16, Section 18984(a) – Add the following new subsection “A jurisdiction may waive a commercial business’ obligation to comply with some or all of the organic waste requirements of this article if the generator is a commercial business that provides documentation or the jurisdiction has evidence determining that the collection trip would be counterproductive in terms of collection vehicle fuel consumed per ton of organic waste collected. This determination shall be made by computing the diesel gallon equivalents (DGE) per ton for each mile of incremental travel distance from an established collection route to that business. The resulting DGE per ton efficiency shall then be compared to the average efficiency of the route. Collection trips with a DGE per ton exceeding 25% of the average DGE per ton efficiency of the route may be determined as exempt.”</p>	<p>A change regarding adding an additional waiver if the business’ collection vehicle consumption is greater than the per ton of organic waste collected because CalRecycle has already provided for waivers related to low population. These waivers will address the issue of collection distances. Also, CalRecycle added Article 17 to provide that a jurisdiction will be waived from specified articles and sections in the regulations if they can meet performance requirements specified in this new Article.</p> <p>Further, the Final Environmental Impact Report demonstrates that such a waiver is unnecessary. In order for a hauler to increase VMT to a level that would negate the GHG reductions of organic waste recycling, every truck would need to travel more than 3,000 miles further per trip than its current destination and incur a fuel cost of \$2,784. Ignoring the financial impracticality of material being hauled this distance, the analysis demonstrates that if organic waste generated in California is hauled to a compost facility in the western half of the United States a greenhouse gas reduction will still be achieved.</p>
6462	Barnes, K., City of Bakersfield	<p>Page 17, Section 18985.1(b) – Outreach and education of self-haulers should be done by the gatehouses at all recycling, transfer, and disposal facilities rather than be the responsibility of jurisdictions. Many self-haulers only haul occasionally and will certainly be in contact with the gatehouses, while they may never have any reason to be in contact with the jurisdiction. Likewise, jurisdictions have no basis to work from to identify self-haulers.</p>	<p>CalRecycle deleted requirements that jurisdictions specifically identify and educate self-haulers in response to this comment. Jurisdictions can meet the requirement to educate self-haulers by including information on self-hauling in their general education and outreach material provided to all generators. CalRecycle deleted language requiring solid waste facility operators to educate self-haulers as it would be overly burdensome and is outside the scope of what EAs monitor at solid waste facilities. This change was made to provide the least burdensome approach and still achieve the required disposal reduction.</p>
6463	Barnes, K., City of Bakersfield	<p>Page 61 onward, Article 6.2, in related sections – Taking and analyzing one cubic yard samples of processed organic residuals is laborious, unproductive, and economically burdensome for the amount of potential benefit. One cubic yard holds 220 gallons. CalRecycle is already aware that the compost industry is having great difficulty with smaller volume (one gallon) testing related to Title 14 regulations on physical contaminants (PC) adopted in 2015. Testing of such large volume samples of raw collected organic wastes or processed residuals is out of the question. Furthermore, CalRecycle required dry weight measures for the PC testing. Obtaining dry weights of raw, putrescible organic materials requires heating samples to dry out, which is impractical.</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>The 200 pounds is what was used for the Statewide waste characterization studies performed during the past 5 years by California (CalRecycle), Washington, New York, Georgia and Connecticut have used a sample weight between 200 to 300 pounds. Furthermore, ASTM</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>international (American Society for Testing and Material) also suggests a minimum sample weight of 200 pounds be used in waste characterization related studies.</p> <p>The weight basis (dry or wet) is not specified in the regulations, because it already specifies that the sample be “representative of a typical operating day” and “a random, composite sample taken either from various times during the operating day or from various locations within the pile.” Also, the number of samples taken will be leveling the daily variations due to the fluctuations in the moisture content in the sample and provide a more representative weight that will be reported quarterly.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
5011	Bartheld, E, American Forest & Paper Association	<p>On behalf of the American Forest &amp; Paper Association (AF&amp;PA) we are writing regarding the CalRecycle document, Summary of Changes Made to the Proposed Organic Waste Reduction Regulations list on page one of the changes made as: Removed restrictions on collecting plastic coated paper and textiles in the blue container.</p> <p>However, the proposed regulations on page 18 state:  Article 5. Generators of Organic Waste  Section 18986.1. Non-Local Entities Requirements...  ....(1) The following shall not be collected in the green container or blue container:  (A) Textiles, carpets, plastic coated paper, and human or pet waste.</p> <p>Please remove the reference on page 18 that restricts plastic coated paper from the blue container in this and all other sections, as we believe it was your intent to allow these materials to be accepted.</p>	Thank you for the comment. CalRecycle amended the applicable sections for consistency.
6017	Baysmore, G, Citizen from Oakland	Suggests expempting certain operations from BAAQMD regulations, including small backyard operations.	Comment noted, CalRecycle does not have the ability to exempt operations from the regulations of other environmental agencies.
6018	Baysmore, G, Citizen from Oakland	Suggests expempting certain operations from BAAQMD regulations, including larger operations that provide a community service such as those located on school sites, or at nonprofits, or co-ops.	Comment noted, CalRecycle does not have the ability to exempt operations from the regulations of other environmental agencies.
6019	Baysmore, G, Citizen from Oakland	Is concerned about the monopolistic nature of this contract	Comment noted. Comment does not appear directed at the regulatory text, but at a local waste contract
3129	Bell, J., Solano County	We recommend reducing the mandated oversight frequency from once per quarter to once per year. The LEA should be given more discretion to require operators to perform measurements and load checking, where authority is currently described in 14 California Code of Regulations Sections 17409.5.2 to 17409.5.8 and 17867 and 17896.44.1. The LEA is competent and able to prioritize inspections and the need for mandated verification and oversight, and where and when necessary will implement a quarterly verification program without the State Minimum Standard dictating so.	CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.

Comment Number	Received From	Question/Comment	Response(s)
3130	Bell, J., Solano County	<p>The regulation of haulers indirectly includes a regulatory compliance standard for all businesses participating. The responsibility of the generator, hauler and waste processors are intertwined. The development of a functioning and compliant waste management system is the goal. The proposed regulations are a positive start in the development of this functioning and compliant waste management system. There are substantial costs associated with the implementation of the proposed regulations. The high cost associated with the proposed regulations define this project as a "Major Regulation" (the projected cost exceeds 50 million dollars). The high cost of implementation is stated as being offset by the cost savings associated with public health improvements and reduced health care costs over time; however, these cost savings are not immediate, so implementation costs will not be offset for years. The regulations impose additional reporting requirements on the LEA, as well as a duplicative requirement for the LEA, generators, haulers, and processors to maintain a list of compliant business. LEA funding is primarily from tipping fees, and public health and health care costs have little impact on tipping fees. As such, reimbursement for the increased costs is expected to lag, requiring the LEAs to increase the rates charged to the regulated community.</p>	<p>Comment noted. Local Enforcement Agencies are already required to review records (load checking, tonnage, etc.) as part of the EA Roles and Responsibilities.</p>
3131	Bell, J., Solano County	<p>Garbage rates are increasing each year. Garbage rates for new franchise agreements in Solano County have escalated dramatically and include increased costs associated with regulatory requirements. If the estimated rate increases are found underestimated over time, this office recommends the use of existing AB32 Cap and Trade funding to assist with facility infrastructure and to keep the actual cost conveyed to rate payers at a minimum, as one of the benefits of this program is to decrease the generation of gas from organics in the landfills. The cost savings associated can be correlated and attributed to the reduction in climate changing pollutant emissions and can be quantified to provide financial incentives for the reduction of climate changing pollutants with the financial reward increasing accordingly with the amount of pollutant diversion.</p>	<p>CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.</p> <p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe "any fees" that may in the future be imposed by the numerous local jurisdictions in California as "likely" to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
3132	Bell, J., Solano County	<p>The proposed regulations include procedures for inspection and cleaning schedules to minimize organic waste container contamination. Language in the proposed regulations requires the development of written procedures to implement an acceptable container management program. Education and outreach requirements are included in the proposed regulations. Listings of all businesses involved with the food recovery operations within each jurisdiction are required for development as part of the proposed regulations. The proposed regulations should focus on education and voluntary compliance and should have less emphasis on regulatory penalties for non-compliance.</p>	<p>The comment suggest removing emphasis on regulatory penalties for compliance, including for container contamination. The regulations do not require penalties for generators who contaminate containers. As a general practice, CalRecycle favors education and outreach first and penalty enforcement as a last resort.</p>
3133	Bell, J., Solano County	<p>Compliance evaluations and a mandated enforcement program are all tools which are included in the proposed regulations. As the program evolves, it is important to implement a review and update process to facilitate where goals are being met and to where slight changes or modifications may be necessary to facilitate reaching these ambitious diversion goals.</p>	<p>Comment noted. Comment is not recommending a regulatory text change.</p>
3134	Bell, J., Solano County	<p>Organic Waste Recycling and Capacity Planning should be streamlined and simplified as much as possible to reduce administrative cost throughout the project.</p>	<p>Comment noted, the comment does not request a specific change. However CalRecycle did amend the planning requirements to only require planning every 5 years.</p>
3135	Bell, J., Solano County	<p>Language should be included for a recommended annual review of the program, along with potential amendments to the existing regulations corresponding to the nuances and issues identified during the process. In this manner, the General Public, all businesses, and the regulatory agencies involved can work together towards a common and hopefully achievable goal.</p>	<p>Comment noted. CalRecycle declines to add this requirement as it will be evaluating the regulatory program on an ongoing basis and determining on an as-needed schedule whether amendments to the regulations are necessary.</p>
9087	Bell, K., Western Placer Waste Management Authority	<p>In addition to these comments, WPWMA generally requests that CalRecycle revise the proposed regulations to minimize the burden on facility operators; develop and support sustainable end-use markets; and establish a safe harbor for operating facilities regarding odor complaints related to organics handling and processing.</p>	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. CalRecycle has sought to address this concern in a manner that is also in compliance with the statutory targets and requirements. As noted in the Initial Statement of Reasons, which was released for public review in January of 2019:</p> <p>“The draft regulations originally prohibited jurisdictions from implementing new mixed waste processing systems after 2022, and required all new services to implement source-separated curbside collection as a means of ensuring that collected organic waste would be clean and recoverable. In response to stakeholder feedback, CalRecycle eliminated the prohibition on new mixed waste processing systems provided that the receiving facilities demonstrate they are capable of recovering 75 percent of the organic content received from the mixed waste stream on</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>an annual basis. The performance standard addresses stakeholder concerns about limiting flexibility, without compromising the goal for the regulations to achieve the statutory requirements.”</p> <p>The ISOR goes on to note that CalRecycle crafted regulations to allow for mixed waste collection provided that these collection services transport collected material to a facility that recovers 50 percent of the organic content it received by 2022 and 75 percent by 2025:</p> <p>“With very few exceptions, unique materials can only be processed and recovered when they are kept separate from other materials. This is primarily due to the fact that distinct materials are recovered through separate processes that are specifically designed to handle only that type of material. For example, metals, paper, and plastics are remanufactured through distinct processes (e.g. metal is smelted, paper is pulped and washed). Largely because of this, while material may be valuable as a homogenous commodity, it can become difficult or impossible to recycle when it is contaminated with other materials (e.g. many materials lose their value when they are commingled with other materials.) This principle holds true, and is perhaps more of a factor in the recovery of organic waste. Required source-separation of organic waste helps ensure that organics are kept clean, separate and recoverable.</p> <p>However; throughout the informal regulatory engagement process stakeholders raised concerns about potential costs associated with providing commercial and residential generators with a third container to source separate organic waste.</p> <p>Stakeholders also noted that several cities and counties implement single container collection services and process all the collected material for recovery. Stakeholders argued that allowing the use of a single-container collection system is a viable and cost-effective alternative that can help the state meet that statutory organic waste recovery targets.</p> <p>To respond to stakeholder requests for additionally flexibility CalRecycle crafted this section and Section 18984.2. These sections allow alternatives to providing a three-container source-separated organic waste collection service. Under these section jurisdictions are allowed to require their generators to use a service that does not provide the generators the opportunity to separate their organic waste for recovery at the curb. In order to ensure that the state can achieve the statutory organic waste reduction targets, these collections services are required to transport the containers that include organic waste to high diversion organic waste processing facilities that meet minimum organic content recovery rates (content recovery rates are specified in Subdivision (b) of this section)...”</p> <p>The commenter has stated in each comment period, that they believe the requirement to recover 75 percent of the organic content collected in these mixed waste collection services is unrealistic and infeasible. In turn CalRecycle staff repeatedly communicated to the commenter that the recovery targets cannot be lowered without compromising the integrity of the regulations. This was further documented for this commenter and the public in the ISOR:</p> <p>“These minimum recovery rates are necessary because when the opportunity to recover material through source separation is lost, the state must ensure that minimum recovery levels are met at processing facilities. While this section provides additional flexibility to jurisdictions, CalRecycle must consider its obligation to ensure that the regulations are designed to achieve the statutory targets. If 100 percent of jurisdictions employed this collection option in 2022 the state could not</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>meet the mandatory recovery target of 50 percent unless at least 50 percent of the organic waste collected from these services is recovered.</p> <p>Similarly, if 100 percent of jurisdictions employed this collection option in 2025 the state could not meet the mandatory recovery target of 75 percent unless 75 percent of the organic waste collected from these services is recovered.</p> <p>Therefore, in order to meet the recovery targets specified in statute and the state’s ultimate climate goals the recovery standards included in this section are the minimum standards necessary.</p> <p>As generation of organic waste increases with population growth, these minimum recovery rates may need to be revisited. As stated previously the organic waste reduction targets are linked to a 2014 baseline of 23 million tons. This requires the state to dispose of no more than 5.7 million tons by 2025. If, as CalRecycle projects, generation increases to 26 million tons of organic waste by 2025, recovering 75 percent of 25 million tons will only reduce disposal to slightly more than 6 million tons, resulting in the state missing its organic waste recovery targets. The need for this rate increase could be mitigated if higher recovery rates are achieved through source separation, or if efforts to increase source reduction through food recovery and other methods are successful. However, the recovery rates established in this regulation should be considered an absolute minimum.”</p> <p>CalRecycle has, prior to and during this rulemaking, communicated that the recovery efficiency requirements established in the regulation is the minimum level that the statute can tolerate. The commenter suggests existing infrastructure that cannot meet this standard should be “protected” or provided a “safe-harbor.” The commenter requests changes in the proposed regulations that cannot be reconciled with the statutory targets because CalRecycle finds that it cannot propose a regulation consistent with a statutory 2025 target that permits an unknown portion of the state from implementing the requirements necessary to achieve that target.</p> <p>CalRecycle acknowledges the role of existing infrastructure and acknowledges that previous investments in infrastructure were consciously made to achieve targets that were established prior to the adoption of SB 1383. However, the legislative direction in SB 1383 is unmistakably clear. The Legislature required CalRecycle to adopt regulations to achieve mandatory organic waste reduction levels. Nothing in the regulations prevents facility operators or jurisdictions from investing in facility upgrades or adapting existing facilities to process waste in a manner that meets the minimum regulatory requirements.</p>
9088	Bell, K., Western Placer Waste Management Authority	Section 17402(a)(6.6): “Gray container waste” or “Gray container collection stream” means solid waste that is collected in a gray container that is part of a three-container organic waste collection service that prohibits the placement of organic waste in the gray container. “Mixed waste organic collection stream” defined in 17402(a)(11.5) means organic waste collected in a blue container or a gray container. These definitions appear to be in conflict with one another. Recommend clarifying the materials that are allowable in the gray container.	CalRecycle has revised the definition “mixed waste organic collections stream” in response to comments. The mixed waste organic collection stream definition was revised to delete the different container colors in order to make the definitions consistent. The “gray container collection stream” is the collection of the solid waste in a gray container that is part of the three-container organic waste collection service that is intended to collect solid waste not organic waste but could have some organic waste that is inadvertently collected.
9089	Bell, K., Western Placer Waste	Section 17402(a)(7.5): “Incompatible materials or incompatibles” should include materials, organic or otherwise, for which no identifiable and sustainable markets	A change to the regulatory text is not necessary. The term “incompatible material” is used at transfer/processing facilities to determine the cleanliness of the organic waste recovered from the

Comment Number	Received From	Question/Comment	Response(s)
	Management Authority	exist, in addition to those materials for which the facility is not designed, permitted or authorized to perform organic waste recovery activities.	mixed organic waste collection stream and the source separated organic waste. Incompatible material is determined by what the end-user is designed, permitted, or authorized to receive and process. This is necessary so that the material sent out will be largely compatible with the facility for further processing.
9090	Bell, K., Western Placer Waste Management Authority	Section 17402(a)(11.5): "Mixed Waste Organic Collection Stream" means organic waste collected in a blue container or a gray container transported to a high diversion organic waste processing facility. The definition of "Gray Container Waste" per 17402(a)(6.6) prohibits the placement of organic waste in the gray container. This term is misleading, as it seems to refer to mixed organics when the intent is mixed waste that could include organics. Recommend removing "Organic" from the name so that it reads "Mixed Waste Collection System".	CalRecycle has revised the definition "mixed waste organic collections stream" in response to comments. The mixed waste organic collection stream definition was revised to delete the different container colors in order to make the definitions consistent. The "gray container collection stream" is the collection of the solid waste in a gray container that is part of the three-container organic waste collection service that is intended to collect solid waste not organic waste but could have some organic waste that is inadvertently collected.
9091	Bell, K., Western Placer Waste Management Authority	Sections 17409.5.2, 3, 4, 5, 6, 7, 8: The daily measurement requirements contained in these sections is overly onerous, burdensome, and costly to facility operators. The waste stream does not vary drastically over short periods of time and it stands to reason that such waste composition studies could be conducted much less frequently and still provide representative data. CalRecycle has previously implemented similar measurement and testing protocols before vetting, as with the recent compost contaminant regulations. CalRecycle needs to explain how this measurement data will be reviewed and used.	CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. For statewide consistency, it is necessary to specify how a facility is to measure recovery efficiency to determine if it meets the definition of a high diversion organic waste processing facility. The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample be a random and representative of a typical operating day for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data. In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.
9092	Bell, K., Western Placer Waste Management Authority	Clarify each "organic waste type" for which cubic yard samples must be taken.	CalRecycle staff has noted the comment. Section 18982(a)(46) defines what material is considered organic waste for the purpose of these requirements. Organic waste includes solid waste containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscaping and pruning waste, organic textiles and carpet, lumber, wood, paper produce, print and writing paper, manure, biosolids, digestate and sludge.
9093	Bell, K., Western Placer Waste Management Authority	The WPWMA recommends no more frequent than semi-annual measurement with the primary focus on the organic content of materials destined for disposal.	CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling.

Comment Number	Received From	Question/Comment	Response(s)
			<p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days per quarter instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data. In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
9094	Bell, K., Western Placer Waste Management Authority	Section 17409.5.6: Many existing organics facilities do not have room to separate similar types of material by origin. Requiring segregation of similar materials is impractical and burdensome to facility operators	<p>Comment noted. In order to accurately determine if a facility is meeting the organic waste recovery requirement, waste streams must be kept separate until sampling measurements have been taken.</p> <p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. For statewide consistency, it is necessary to specify how a facility is to measure recovery efficiency to determine if it meets the definition of a high diversion organic waste processing facility.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data. In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
9095	Bell, K., Western Placer Waste Management Authority	Section 17409.5.11: The requirement for one load check per day per 500 tons per source sector is extremely onerous. Additionally, there will be no gray cart in a 2-cart system; clarify whether this loadcheck requirement will apply to the blue cart in a 2-cart system.	CalRecycle has deleted the loadchecking requirement Section 17409.5.11 in response to comments.
9096	Bell, K., Western Placer Waste Management Authority	Section 17414.2(c): 3-year record retention requirement conflicts with 5-year retention required in Section 17869. Recommend a single retention period of 3 years for all records related to the regulation.	CalRecycle has revised Section 17414.2 in response to comments. The change requires records be accessible for five years. This change will align with the adopted AB 901 regulations (RDRS).
9097	Bell, K., Western Placer Waste Management Authority	Section 17867(a)(2): The regulations will result in the composting of new and increased waste streams, which could alter a facility's odor profile. Additionally, the impact of odors on receptors considered a "nuisance" is subjective, the potential for which can never be eliminated.	A change to the regulatory text is not necessary. The comment is not relevant because this is an existing regulation text and CalRecycle is not proposing a revision to this standard. This is not within the scope of this rulemaking.

Comment Number	Received From	Question/Comment	Response(s)
		Recommend revising this Section to read as follows: "All handling activities shall be conducted in a manner that minimizes odor impacts so as to reduce the potential for causing a nuisance."	
9098	Bell, K., Western Placer Waste Management Authority	Section 17867(a)(4): The requirement for multiple daily loadchecks remains burdensome to facility operators. However, we appreciate that the LEA will have the discretion to approve an alternative loadcheck frequency.	CalRecycle has deleted the loadchecking requirement from this section in response to comments.
9099	Bell, K., Western Placer Waste Management Authority	Section 17869(a): 5-year record retention requirement conflicts with 3-year retention required in Section 17414. Recommend a single retention period of 3 years for all records related to the regulation.	CalRecycle has revised Section 17869(a) in response to comments. The change requires records be maintained for five years. This change will align with the adopted AB 901 regulations (RDRS).
9100	Bell, K., Western Placer Waste Management Authority	Section 18982(a)(33): The term "High Diversion Organic Waste Processing Facility" is misleading. It appears that the intent of this term is to mean a facility that processes mixed solid waste, organic or otherwise. Recommend removing "Organic" from the name so that it reads "High Diversion Waste Processing Facility". Clarify the 50% diversion requirement – does it refer to the diversion of all waste received at the facility, or just the organic fraction of the waste stream?	A change to the regulatory text is not necessary. The term "high diversion mixed waste processing facility" is not used in the proposed regulations. The term "high diversion organic waste processing facility," which is used and defined in Section 18982(a)(33). The term "High Diversion Organic Waste Processing Facility" refers to transfer/processing facilities that meet the 50% by 2022 or 75% by 2025 organic waste recovery efficiency standard for a mixed waste organic (MO) collection stream. The 50/75% refers to recovery of organic waste after processing of material from the MO collection stream.
9101	Bell, K., Western Placer Waste Management Authority	Section 18982(a)(46): The definition of "organic waste" should only include visually identifiable, readily compostable materials. The definition in this section is inconsistent with AB 901 Section 18815.2(a)(39) "Organics", which does not include textiles and carpets. Textiles, carpets, and similar materials should not be considered "organic" unless they are easily visually identifiable as organic. Testing to determine the fiber types of those materials is difficult and impractical; processing facility employees should be able to easily and quickly identify organic materials at the scalehouse. Additionally, these materials are not readily compostable, which is likely the main way processing facilities will be handling organics. Materials that have been processed to the point where methane is depleted or reduced to a specified level, such as digestate produced from anaerobic digestion, should no longer be classified as "organic" and subject to landfilling limitations. Additionally, solid waste facilities are required to make the distinction between treated and untreated wood waste; CalRecycle should also make that distinction as those materials may not be sent to the same facility and/or may be sent to different end uses, not only landfills. Recommend that treated wood waste not be classified as organic waste.	Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute. Comment noted. The regulations are structured to specify material that cannot be collected in certain containers, e.g. glass cannot be collected in green containers with organic waste. Further, the regulations define organic waste however they do not specifically require organic specific materials to be collected together, e.g. the regulations do not require food and textiles to be collected together. The regulations allow jurisdictions to source separate materials that are recoverable when mixed together The definition of organic waste itself does not govern how specific types of materials are handled. The definition identifies which materials are organic waste. The active text of the regulation, not the definition, controls how material is handled. Nothing in the regulatory text requires textiles or dead animals to be placed in the green container.

Comment Number	Received From	Question/Comment	Response(s)
			<p>The regulations already allow organic waste, which can include non-hazardous wood and dry lumber, to be included in the green container. The regulations also already allow for non-hazardous wood and dry lumber to be included in the blue container.</p> <p>Regarding treated hazardous wood waste, CalRecycle revised Section 18984.1 to add a new subsection indicating that this material should not be allowed in the blue container.</p>
9102	Bell, K., Western Placer Waste Management Authority	Section 18983.1: Recommend including additional alternative technologies that could divert materials from landfills and reduce short-lived climate pollutants, such as pyrolysis or gasification, to handle sludges and other materials that may be problematic to compost or otherwise market.	CalRecycle concurs that maintaining flexibility for other recovery processes, not specifically identified in section 18983.1(b), which may still constitute a reduction of disposal of organic waste and can achieve equivalent greenhouse house gas reduction that meets or exceeds the baseline of 0.30 MTCO <sub>2</sub> e per short ton. Therefore, the proposed regulations include Section 18983.2 Determination of Technologies That Constitute a Reduction in Landfill Disposal as a pathway for including additional activities and technologies.
9103	Bell, K., Western Placer Waste Management Authority	Section 18983.2: The regulation states that emission reductions from alternative uses must equal those of compost. CalRecycle should provide the methane reduction calculations for compost to establish a baseline, justify these requirements and demonstrate CalRecycle's position that compost achieves the greatest methane reductions. The emissions reductions in Section 18983.2(a)(3) may be overly stringent and may limit or eliminate the possibility of employing alternative technologies which could still serve to divert organics from landfills and significantly reduce short-lived climate pollutants. Suggest removing this requirement or allowing discretion for higher limits by reviewing agency.	<p>Several commenters suggested using avoided landfill emissions as the benchmark in the determination of processes or technologies that constitute a reduction in landfill disposal. Although this proposal might increase diversion of organics from landfills, it would not achieve the greenhouse gas emissions reductions required to meet the methane reduction target required by SB 1383 or the organics diversion targets specified in the Short-Lived Climate Pollutant Reduction Strategy. The benchmark value of 0.30 MTCO<sub>2</sub>e per short ton organic waste was set to ensure emission reductions for any new process or technology are comparable to the emission reductions necessary to achieve the strategy's emission reduction goal of 4 MMTCO<sub>2</sub>e for this sector.</p> <p>Several stakeholders submitted comments that indicate confusion about how the 0.30 number was calculated. To provide greater clarity, staff provide a detailed description about the calculation of this number in the guidance doc referenced in the FSOR.</p>
9104	Bell, K., Western Placer Waste Management Authority	Section 18984.1(a)(5)(A): Prohibits collection of carpets, non-compostable paper and hazardous wood waste in the green container. No longer prohibits collection of human and pet waste, as included in Section 30.1(a)(5)(A) of the May 2018 draft regulations. Recommend revising to prohibit human and pet waste in the green container.	<p>If the Local Enforcement Agency determines that a material type cannot be safely recycled, then a jurisdiction would be allowed to list that material as not acceptable. Additionally, during the informal workshops many other stakeholders stated that they have programs for these material types. Further human and pet waste are not required to be measured as organic waste for the purpose of measuring contamination in 18984.5. With respect to human and pet waste, a jurisdiction may prohibit human waste in the green or blue container in a 3-container system and in the green container in a 2-container system. This change is necessary in order to support jurisdiction efforts to minimize public health impacts.</p> <p>This revision does not apply to pet waste, as many jurisdictions collect manure and take this material to processing facilities that have to meet pathogen reduction requirements.</p>
9105	Bell, K., Western Placer Waste Management Authority	Section 18984.2: Recommend inclusion in this Section of the same language in Section 18984.3(e) allowing organic waste specified for collection in the blue container to be placed in bags.	<p>The regulations allow bags to be used in the blue or gray containers with no additional requirements. The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility's normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.</p>
9106	Bell, K., Western Placer Waste Management Authority	Section 18984.5(a)(2): Allows a hauler to dispose of green or blue container contents if visible prohibited container contaminants are observed. Clarify that facilities accepting this waste for disposal will be allowed to dispose of such loads without being required to process the load and/or without being penalized for accepting the load, and that haulers should be required to notify processing/disposal facilities of each such load.	Yes, facilities operators can accept containers that contain visible prohibited container contaminants. However, if a load containing visible prohibited container contaminant is received on a day that the operator is performing the measurements protocol then that load would be included in the sampling and measurement protocol used to determine the amount of organic waste sent to disposal. The operator would be required to record the results of the measurement and report the percentage of organic waste sent to disposal.
9107	Bell, K., Western Placer Waste Management Authority	Section 18987.2: Biosolids should also be allowed to be transported for use in alternative technologies identified in Section 18983.2. Recommend revising Section 18987.2(a)(1) to read as follows: "Transported only to a solid waste facility of operation for additional processing, composting, in-vessel digestion, or other recovery as specified in Section 18983.1(b) or Section 18983.2 of this division."	CalRecycle has deleted Section 18987.2 in response to comments
9108	Bell, K., Western Placer Waste Management Authority	Section 18987.2(a)(2): Clarify that permitted disposal facilities receiving sewage sludge and biosolids not suitable for additional processing or recovery will not be penalized for accepting said materials.	CalRecycle has deleted Section 18987.2 in response to comments
9109	Bell, K., Western Placer Waste Management Authority	Section 18990.1: This section appears to prohibit facilities from rejecting organic wastes from outside jurisdictions. Facilities must be able to maintain control of the source of waste to ensure sufficient processing and disposal capacities for host jurisdictions. Clarify this section to ensure that facilities can maintain flow control or other agreements to reserve processing and disposal capacity for local use and that facilities are not required to accept materials from outside jurisdictions.	<p>Section 18990.1(c)(4) provides that this section does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery.</p> <p>Nothing in the regulations prohibits facilities from contracting with various parties, including jurisdictions, for capacity within their facility. What the regulations do prohibit is a jurisdiction adopting an ordinance or similar restriction to legally prohibit material from other jurisdictions from going to facilities within its boundaries simply because of where the material originated. This is consistent with existing case-law.</p>

Comment Number	Received From	Question/Comment	Response(s)
9110	Bell, K., Western Placer Waste Management Authority	Section 18993.1(f): Recommend the inclusion of electricity, biochar, wood chips, mulch and other landscaping products in the recovered organic waste products that could be procured by jurisdictions, in addition to compost and renewable transportation fuel.	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p> <p>However, CalRecycle disagrees with adding other products as listed in the comment due to lack of conversion factors and uncertain landfill diversion of feedstock for these products.</p>
9111	Bell, K., Western Placer Waste Management Authority	Section 20700.5: While the WPWMA appreciates inclusion of an LEA-approved equivalent alternative to the 36" earthen material requirement. Not only is this operational requirement financially burdensome to landfill operators, but the addition of 36" of material may exceed a facility's final fill grades and reduce overall landfill capacity. The WPWMA maintains that CalRecycle must prove that use of 36" earthen material is effective in reducing methane emissions prior to enacting this requirement. Clarify that the addition of this material will not serve to reduce a landfill's permitted airspace.	<p>CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments. The section was removed and the requirement was included as part of the Status Impact Report (SIR). The SIR was amended to add the requirement to identify areas in the landfill that would remain with intermediate cover. The addition of this requirement to the SIR ensures that areas with intermediate cover are maintained to meet the intermediate cover criteria of controlling the infiltration of precipitation into waste, vectors, fires, odors, blowing litter, and scavenging to reduce threats to public health and safety and the environment.</p>
9112	Bell, K., Western Placer Waste Management Authority	Section 21695: CalRecycle should evaluate impacts of the regulations on landfills prior to implementing the regulations rather than putting the financial burden on facilities after the regulations have been implemented. Joint Technical Document (JTD) revisions are costly and time-consuming for facility operators. Facilities should be able to address any necessary JTD revisions resulting from the regulations as part of the normal 5-Year Solid Waste Facility Permit Review process.	<p>CalRecycle has revised Section 21695 in response to comments. The changes to the regulatory text include the requirement that operators identify those areas in the landfill that would remain with intermediate cover and to extend that date for submittal of the Status Impact Report (SIR) from 180 days to one year (365 days) from the effective date of these regulations</p> <p>This standard is not duplicative of a five-year review. The purpose of the SIR is to assist operators better understand the potential impact the proposed regulations could have on their landfill which is different than the five-year review. A five-year review is completed by the EA every five years from the last review and evaluates (among other things) the information provided in the application for the proposed facility to determine whether or not the facility will be able to operate in accordance with state minimum standards and permit terms and conditions.</p> <p>Whereas, the SIR is a site specific, one-time submittal that is prepared by the operator after they have reviewed their landfill operations to determine any potential impacts from the reduction of organic disposal (waste flow) to their landfill. The one-year timeframe established in this regulation for the submittal of the SIR is intended to assist the operator in determining and assessing in the timing of those impacts in order properly implement any changes or modifications to the landfill in a timely manner. Because only the potential impacts associated with the reduction of the amount waste disposed will be reviewed, staff believe that one-year from the effective date of the regulations is an adequate amount of time for the operator to meet the requirements of this section.</p>

Comment Number	Received From	Question/Comment	Response(s)
			In addition, this section provides a list of items to be considered by the operator in order to assist them complete the SIR. This information in items listed is needed in order to adequately evaluate the potential impacts to the landfill resulting from the reduction of organic disposal at landfills.
1047	Bell, Kevin Placer County Public Works	The amount of prescriptive detail contained in the regulation goes far beyond what is necessary to achieve the goal of increased organics diversion. Similar to AB 939, jurisdictions should be afforded more flexibility to identify and implement programs.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
1048	Bell, Kevin Placer County Public Works	The regulation imposes requirements on jurisdictions that we believe the Legislature did not grant to CalRecycle, such as requiring ordinances, procurement of organic materials, and refusing to allow consideration of good faith effort.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
1049	Bell, Kevin Placer County Public Works	The extent of the regulation is unreasonable considering the landfill sector's contribution to statewide emissions compared to other sectors that are not yet regulated. The requirements should be commensurate to the statewide impact.	Commenter is expressing an opinion regarding the focus on landfill emissions. This is a statutory issue rather than one related to the scope of the regulations. The SB 1383 statute is designed to address landfill emissions and CalRecycle is under a mandate to implement those requirements.
1050	Bell, Kevin Placer County Public Works	The requirements would force the County that currently utilizes a one-container system, to provide a two- or possibly three-container system, significantly increasing traffic related emissions and potentially decreasing diversion (gray containers to landfill instead of sorted). This seems contrary to the goal of this regulation.	The draft regulations allow for a jurisdiction to use an unsegregated single-container collection service. See Section 18984.3 of the regulations.
1051	Bell, Kevin Placer County Public Works	We object to the purchasing targets. There are better ways to develop markets through procurement policies and focus on sectors (e.g. State agencies) with greater demand.	Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor's office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot

Comment Number	Received From	Question/Comment	Response(s)
			<p>supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.</p>
1052	Bell, Kevin Placer County Public Works	The documentation and reporting requirements should be achievable through the existing Electronic Annual Report, which is more efficient than creating a new system and entirely sufficient for CalRecycle to oversee progress.	Comment noted. CalRecycle may consider streamlined jurisdiction reporting opportunities, such as modifying the Electronic Annual Report process.
1053	Bell, Kevin Placer County Public Works	There must be consideration in the regulation for the National Sword impacts, particularly in regard to its impact on paper markets.	Comment noted. Commenter is expressing an opinion regarding the overall scope of the proposed regulations but is not proposing specific language or a particular method to address National Sword impacts.
1054	Bell, Kevin Placer County Public Works	The regulation places a disproportionate burden on jurisdictions as compared to state agencies; e.g., no penalties are placed on state agencies that fail to comply.	Comment noted. Commenter is expressing an opinion regarding the overall scope of the proposed regulations but is not proposing specific language. The SB 1383 language did not clearly provide authority to impose penalties on state agencies.
1055	Bell, Kevin Placer County Public Works	For processing facilities to construct, expand, and process additional types and volumes of organic wastes, CalRecycle needs to ensure that facilities are protected from odor complaints, increasing regulations, and contamination standards.	CalRecycle has noted the comment. The effects of possible future odor compliance or regulations are not within the scope of this rulemaking.

Comment Number	Received From	Question/Comment	Response(s)
1056	Bell, Kevin Placer County Public Works	The definition of “organic waste” should be consistent with current state law and should not include textiles and carpets, biosolids, digestate, and sludges. Many carpets and textiles now are wholly or in part made up of synthetic materials, not visually identifiable as organic, and not compostable. Facility testing to determine the fiber types of those materials is difficult and impractical. Expecting the general public to differentiate between these types of materials when putting them in waste bins is impractical, if not impossible.	CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. Regulations adopted by other agencies or codified in other portions of statute, can employ a different definition for a different purpose. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.
1057	Bell, Kevin Placer County Public Works	More importantly, there is already a California Carpet Stewardship Program for carpet. CalRecycle should instead work with the stewardship organization to ensure the carpet program is successful and meets its legal obligations, as customers are already paying a fee in good faith for this program. Jurisdictions should not be responsible for a producer responsibility program that has failed.	Carpet is not required to be measured as organic waste for purposes of measuring organic waste sent to disposal.
1058	Bell, Kevin Placer County Public Works	The definition of “organic waste” should also not include materials processed to the point where its methane potential is degraded to a specified level (e.g. digestate and sludge).	Comment noted. Digestate and sludge are organic wastes by definition and may still produce methane if disposed.
1059	Bell, Kevin Placer County Public Works	Among other things, this definition includes unnecessary items such as carpet, hazardous wood waste, and non-compostable paper that could be excluded from the regulation. The definition should also include textiles, biosolids, digestate, and sludges and any such materials that cannot either be visually identified as organic, easily collected, or effectively processed by organics facilities.	The comment relates to the "prohibited container contaminants" definition in 18982(a)(55) and is designed describe materials that cannot be composted. The list of materials in the comment suggested to be included CAN be composted.
1060	Bell, Kevin Placer County Public Works	Contaminants should also include human or pet waste.	If the Local Enforcement Agency determines that a material type cannot be safely recycled, then a jurisdiction would be allowed to list that material as not acceptable. Additionally, during the informal workshops many other stakeholders stated that they have programs for these material types. Further human and pet waste are not required to be measured as organic waste for the purpose of measuring contamination in 18984.5.
1061	Bell, Kevin Placer County Public Works	The purpose of creating this definition is unclear, particularly considering how the term is used in Article 13. As defined, “Self-hauler” is so broad that it could describe nearly every resident, business, government facility, or other entity in California. For example, it would include a person who transported their own empty beverage containers to a CRV redemption center. We ask that CalRecycle remove this definition.	The “back-haul” definition is intended simply to clarify a portion of the definition of “self hauler” and the definition itself is not the appropriate mechanism to place specific requirements on how self-hauling or back-hauling is conducted. Furthermore, Public Resources Code Section 40059(a)(1) specifically places aspects of solid waste handling which are of local concern, such as means of collection and transportation, within the local control of counties, cities, districts, or other local governmental agencies. In addition, SB 1383 (in Public Resources Code Section 42654) specifically states that nothing in these regulations abrogates or limits the authority of local jurisdictions to enforce local waste transportation requirements. Commenters asked CalRecycle to consider whether the definition of self-hauler is needed since it is so broad. If it is needed, the

Comment Number	Received From	Question/Comment	Response(s)
			<p>definition needs to be revised and it needs to be clarified on how the Department will be getting information from jurisdictions about the self-haulers.</p> <p>Section 18994.2(f)(4) regarding reporting on the number of self-haulers by the jurisdiction was deleted. However, the definition in Section 18982(a)(66) is still needed.</p>
1062	Bell, Kevin Placer County Public Works	<p>In addition, the tracking of self-haulers in this regulation is not necessary. Businesses that self-haul organic waste, for the most part, are currently identified and monitored through AB 1826 implementation and AB 901 reporting, which should be sufficient. It is unclear how jurisdictions are to identify self-haulers outside of these methods.</p>	<p>Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements.</p> <p>Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. Therefore, CalRecycle deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(b) to include all education requirements for single unsegregated collection systems.</p>
1063	Bell, Kevin Placer County Public Works	<p>We appreciate the revised language in Section 18983.1 to specify that material known as “Material Recovery Fines” do not constitute landfill disposal when they are used as cover material. As previously commented, due to the nature of the material, there is no diversion market but the material serves a useful purpose as cover material. Additionally, as organics programs increase, the amount of organic materials in fines will only decrease.</p>	<p>Comment noted. The use of organic waste as alternative daily cover constitutes landfill disposal of organic waste. Language was added to clarify that use of non-organic materials does not constitute landfill disposal of organic waste. Facilities are not required to remove organic material from MRF fines. Facilities are required to sample material they send to disposal to determine the portion of organic waste they are sending to disposal. Pursuant to the sampling requirements in the regulations a representative sample of material sent to disposal must be sampled to determine the level of organic waste disposed. This includes sampling of material sent to for use as alternative daily cover. Only the organic fraction of the material sent to disposal is measured as disposal of organic waste. Language was added to clarify that disposal of non-organic materials does not constitute landfill disposal of organic waste.</p>
1064	Bell, Kevin Placer County Public Works	<p>We also appreciate the addition of revegetation and slope stabilization to allow uses of organic waste. This acknowledges the benefit of compost when used in these applications and further supports that CalRecycle should focus on developing compost markets where there is more demand, and not forcing specified amounts of organic procurement on jurisdictions with limited demand.</p>	<p>Thank you for your comment. Procurement is an important component of the proposed regulations and the ability of the state to meet these goals.</p>
1065	Bell, Kevin Placer County Public Works	<p>We are generally opposed to having to justify specific technologies. SB 1383 specifically states that the statewide goal is to “reduce the landfill disposal of organics” and nowhere indicates that certain technologies are preferable over others.</p>	<p>A change to the regulatory text is not necessary because a change that is responsive to the comment’s request would not enable the State to meet the methane emissions reduction target required by SB 1383. As noted in the Initial Statement of Reasons, the purpose of this regulation is to divert organics from landfill disposal, while at the same time ensuring that the State meets the methane emission reduction targets established in SB 1383 and outlined in the Short-Lived Climate Pollutant Reduction Strategy.</p>

Comment Number	Received From	Question/Comment	Response(s)
			Recovery technologies that result in less emissions reductions than composting will not ensure that the State meets the emissions reduction target of 4 MMTCO <sub>2e</sub> from organics diversion set forth in the strategy.
1066	Bell, Kevin Placer County Public Works	The regulation requires a facility to determine the methane reduction potential of a proposed activity (if not already specified as reduction in the regulation). If entities are required to do this to justify that their proposed activity reduces methane, CalRecycle should do the same to support that recovery of the additional materials included in the definition of "organic waste" also reduces methane. If CalRecycle cannot or will not do that, those materials should be removed from the definition.	The comment is conflating two different requirements. The methane reduction potential is designed for consideration of alternative methods that may constitute a reduction in landfill disposal. In order to consider other alternatives, the regulations need to ensure that these alternatives will actually divert organic waste from landfills and will also reduce methane emissions consistent with existing methods such as composting and anaerobic digestion. The definition of "organic waste," on the other hand, is designed for purposes of determining what material is subject to the regulations.
1067	Bell, Kevin Placer County Public Works	The approval of a proposed technology depends entirely on a pass/fail conclusion that the technology results in emissions reductions equal to or greater than 0.30 MTCO <sub>2e</sub> per ton, described in the Initial Statement of Reasons (ISOR) as the GHG reduction achieved by composting mixed organic waste. Assuming that the ISOR calculations are correct in setting this benchmark for mixed organic waste, the methodology will likely prevent the use of valuable technologies that target the most problematic items –those that do not compost well, such as organic carpet or lumber. These materials, which release little carbon to the atmosphere, could easily fail to pass the 0.30 MTCO <sub>2e</sub> hurdle. The rigid 0.30 MTCO <sub>2e</sub> standard could therefore hinder the achievement of the goals stated in SB 1383. We ask that this section be revised to provide the CalRecycle Director more flexibility for approval of proposed processes and technologies.	Several commenters suggested providing more flexibility to consider new technologies that target diversion of source-separated organic materials that do not compost well such as carpet or lumber, and that have a lower methane emissions reduction potential than mixed organic waste decaying in a landfill. The point of utilizing the greenhouse gas reductions associated with composting as a threshold was not to incentive composting, but rather to set a reasonable threshold for ensuring that the regulation incentivizes the greenhouse gas emissions reductions required to meet the methane reduction target required by SB 1383 and the organics diversion targets specified in the Short-Lived Climate Pollutant Reduction Strategy. The benchmark value of 0.30 MTCO <sub>2e</sub> per short ton organic waste was set to ensure emission reductions for any new technology are comparable to the emission reductions necessary to achieve the strategy's emission reduction goal of 4 MMTCO <sub>2e</sub> for this sector.
1068	Bell, Kevin Placer County Public Works	It is unclear why mandating the color of containers used is necessary at all to achieve diversion of organics. Jurisdictions have been implementing recycling programs for decades and it is not necessary or reasonable to have state oversight or rigidity of this level. We recommend the container, labeling, and outreach requirements be significantly simplified.	The collection container uniformity required by this and subsequent sections is necessary to respond to stakeholder feedback, enhance consumer education about organic waste recycling, reduce contamination, and maintain the highest degree of recoverability for source separated organic wastes. This will enhance the education of generators regardless of their location in California. This requirement was recommended by various stakeholders to create consistency and reduce generators' confusion about which container to place organic waste into and thus will result in less contamination and maximize organic waste recovery. See statement of purpose and necessity for Article 3 and for Section 18984.1 -18984.7.
1069	Bell, Kevin Placer County Public Works	We appreciate the revision to allow the container color requirement to be met with a container or lid. But this assumes that traditional, or similar, containers can be utilized in all communities, which is not always practical. For example, in Placer County's Tahoe Basin, waste is collected in standard metal or plastic garbage cans (like those available at hardware stores), purchased by the customer because they fit in bear-resistant sheds, which are crucial in that area. As long as the different containers are easily distinguished, statewide consistency in colors is not needed.	The collection container uniformity required by this and subsequent sections is necessary to respond to stakeholder feedback, enhance consumer education about organic waste recycling, reduce contamination, and maintain the highest degree of recoverability for source separated organic wastes. This will enhance the education of generators regardless of their location in California. This requirement was recommended by various stakeholders to create consistency and reduce generators' confusion about which container to place organic waste into and thus will result in less contamination and maximize organic waste recovery. See statement of purpose and necessity for Article 3 and for Section 18984.1 -18984.7.

Comment Number	Received From	Question/Comment	Response(s)
1070	Bell, Kevin Placer County Public Works	These requirements are excessive and beyond the scope of SB 1383. The prescriptive requirements limit the ability for jurisdictions to change outreach messages when needed.	<p>These requirements are necessary to ensure that generators place the correct materials in the correct bins. This is universally known as a problem in the current hauling system (bin contamination) and is directly related to the success of these programs.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This authority includes creation of rules designed to implement these statewide mandates and ensure that the statewide organic requirements are met. CalRecycle has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals.</p>
1071	Bell, Kevin Placer County Public Works	Markets are changing, as we are currently seeing with the National Sword policy, and permanent labels, especially imprinted ones, cannot be updated as markets change.	<p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers' useful life or by 2036.</p> <p>A jurisdiction's designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>With respect to compactors owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements.</p> <p>In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to meet that statute's signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>In regards to the lid comment, a change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p> <p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>In regards to the new technology, CalRecycle is unclear on how that will help educate the generators.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>he current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state’s efforts to keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier time.</p>
1072	Bell, Kevin Placer County Public Works	Imprinted labels are also not possible on the garbage cans in our Tahoe area (described above), and are an unreasonable and expensive burden on our ratepayers if new containers with imprinted messaging have to be provided.	<p>Thank you for the comment regarding the additional time, great cost savings, and easier compliance with the container color and label requirements. That comment is in support of current language.</p> <p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. 1074	Bell, Kevin Placer County Public Works	This is overall too excessive, and jurisdictions should be allowed to develop container systems and outreach programs that suit their programs and communities best, as they currently are able to do.	<p>The statutory sections described in the comment are informational requirements rather than specific purchasing requirements and there is no conflict with the proposed regulations. Nor is there any explicit Legislative intent expressed in these sections to limit other measures to achieve viable end use markets for recycled material. These statutory sections, if anything, evidence the Legislature's recognition that procurement of recycled material is critical in increasing end use markets.</p> <p>PRC 41074, 41204, 41374, and 41404 are not conflicting procurement mandates or an explicit provision for local authority over procurement but are instead informational requirements to be included in various elements of Countywide Integrated Waste Management Plans (CIWMP). What these portions of the CIWMP elements do is to require a descriptive narrative of methods, if any, which will be used to increase markets for recycled materials. Nothing in these sections are specific to the exact types of materials included in the proposed procurement requirements in the</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>proposed SB 1383 regulations nor do they place any conflicting requirements on levels of procurement.</p> <p>PRC Section 40913 requires CalRecycle to develop a program to assist local agencies in the identification of markets for materials diverted from disposal through source reduction, recycling and composting. It is not a specific procurement requirement, but rather a general informational requirement placed on CalRecycle to assist local government in finding end use markets for materials diverted from disposal. The requirement is not specific to any particular type of recycled material and there is no limitation evidenced in the statute that restricts other types of requirements for end use markets for recycled material.</p> <p>PRC Section 42600 requires CalRecycle to develop a statewide public information and education program to encourage participation by the general public, business, government, and industry in all aspects of integrated waste management. One component of this program is to “[e]ncourage local government procurement of products containing recycled materials...” Again, this is a general informational requirement rather than a procurement requirement, is not specific to any particular type of material, and evinces no intent by the Legislature to limit or restrict other measures to develop end use markets for recycled material.</p>
1075	Bell, Kevin Placer County Public Works	<p>The County very much appreciates CalRecycle’s openness to additional waivers. Pursuant to recent communications with CalRecycle and Rural County Representatives of California, we recommend an additional exemption for communities that are located at higher elevations (i.e. bear habitat) where bears pose a health and safety risk related to food waste collection. The “bear exemption” can be limited to smaller businesses that generate up to 4 cubic yards solid waste per week, where the jurisdiction has determined that it is not feasible to provide the business with a bear-proof container, and all residents. Placer County submitted a formal waiver proposal to CalRecycle on July 3, 2018.</p>	<p>CalRecycle added Section 18984.12(d) in response to this comment. The changes will allow jurisdictions located at or above 4,500 feet apply for a waiver from the food and food soiled paper organic waste collection requirements. Jurisdictions would also be waived from providing containers to their generators. This waiver would apply for residential and small commercial generators that are not regulated by AB 1826.</p> <p>As the commenter noted, jurisdictions 4,500 feet and above face specific waste collection challenges as high-elevation, forested areas that include bear and other wild animal habitat. Food waste collection can attract vectors, including bears, to populated areas creating collection and public safety issues. This change is necessary to prevent a public safety issue that food waste separation and recycling can pose. Generators in high-elevation jurisdictions will be able to continue to use customer provided containers that fit in their locked bear boxes.</p> <p>Jurisdictions that qualify for this waiver, however, will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection. This comment argued that the limited space of locked bear boxes, which this commenter’s jurisdiction uses to secure garbage bins, creates a capacity issue. Although CalRecycle recognizes the threat that vectors, like bears, pose from the collection of food waste, nothing prevents the jurisdiction from providing smaller containers that could fit inside bear boxes.</p>
1076	Bell, Kevin Placer County Public Works	<p>Although CalRecycle has granted Placer County the ability to utilize the exemption pursuant to PRC 42649.82(e)(3)(D) (AB 1826) for businesses that generate 2-4 cubic yards solid waste per week for this purpose, we urge CalRecycle not to limit the SB 1383 “bear exemption” to generators that generate less than 2 cubic yards solid waste per week, as CalRecycle has alluded to, because having exemptions in two laws/regulations will create confusion.</p>	<p>CalRecycle added Section 18984.12(d) in response to this comment. 1077	Bell, Kevin Placer County Public Works	We appreciate the inclusion of the Low Population waiver. However, while this waiver works in many areas, we recommend there also be an allowance for additional low population areas that have fewer than 50 people per square mile but are located within a census tract with greater density. We recommend CalRecycle allow submittal of reasonable jurisdiction-proposed alternatives for low population communities.	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA's definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a>); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-documented history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife's black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383's organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection. Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
1078	Bell, Kevin Placer County Public Works	It is unlikely that circumstances in low population areas will change within two years. We recommend a five-year cycle for renewal of these waivers, instead of the proposed two-year renewal requirement.	<p>CalRecycle agrees that most low-population areas that are granted a waiver by CalRecycle are likely to remain as qualifying low-population areas for longer periods of time; allowing a waiver to be operational for a longer period of time is warranted and will reduce the costs of compliance. CalRecycle has made a language change in response to this comment. After the change was made, commenters were in support that low population waivers are good for five years instead of two.</p>
1079	Bell, Kevin Placer County Public Works	Regarding the requirement that appropriate language outreach is required if more than 5% of a community is defined as "Limited English Speaking Household" or "linguistically isolated" – please define "community". For example, do you mean more than 5% of a jurisdiction, a census tract?	<p>Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.</p>
1080	Bell, Kevin Placer County Public Works	We strongly recommend that jurisdictions be able to develop and implement their own outreach messages and methods that suit their programs and communities best. There is no compelling reason that jurisdictions cannot do this and report their efforts via the existing Electronic Annual Report (EAR). Dictating the specific	<p>CalRecycle determined that baseline outreach requirements and container labeling are necessary for statewide consistency.</p>

Comment Number	Received From	Question/Comment	Response(s)
		messaging, such as in the container labeling requirements, is over-controlling and allows no flexibility to make changes to adjust to changes in markets, diversion programs, or other conditions.	
1081	Bell, Kevin Placer County Public Works	The record keeping and reporting requirements are excessive. Documenting and uploading of a jurisdiction's outreach through existing methods (EAR) is far more reasonable and entirely appropriate.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.
1082	Bell, Kevin Placer County Public Works	This section does not clearly enough indicate that it does not apply to self-haulers. Local jurisdictions should not be put in the position of enforcing this statute against residents that self-haul their organic waste. Those of us implementing these regulations are not clear how we would even accurately identify all the residential self-haulers.	Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements. Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(b) to include all education requirements for single unsegregated collection systems.
1083	Bell, Kevin Placer County Public Works	We would respectfully request that the department take the same approach that it did in the AB 901 regulations and only apply the provisions to commercial self-haulers. Local jurisdictions won't have the ability to enforce this requirement without this change.	Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements. Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(b) to include all education requirements for single unsegregated collection systems.
1084	Bell, Kevin Placer County Public Works	Neither SB 1383 nor CALGreen requirements mandate that jurisdictions adopt an ordinance or other enforceable requirement. Jurisdictions already have the	CalRecycle has been given specific authority under SB 1383 to require jurisdictions to impose requirements upon generators. The regulations do not require CalRecycle to enforce the CalGreen Building Code or MWELo. The regulations impose a requirement that jurisdictions adopt an

Comment Number	Received From	Question/Comment	Response(s)
		<p>authority and legal requirement to enforce building codes, including enforcement of the CALGreen Building Code.</p>	<p>ordinance or other enforcement mechanism that requires compliance with certain provisions of the CalGreen Building Standards Code and MWELo. Nothing in statute or regulation mandates that solid waste Local Enforcement Agencies enforce these requirements.</p> <p>PRC Section 42652.5 provides a broad grant of rulemaking authority to CalRecycle that includes the authority to institute “requirements for local jurisdictions” and “penalties to be imposed by CalRecycle for noncompliance.”</p> <p>The proposed regulations do not strip local jurisdictions of discretion in enforcing purely local ordinances. The regulations instead are requiring local jurisdictions to enforce the ordinances that they are required to adopt, under 14 CCR Section 18981.2, pursuant to a statewide, rather than purely local, regulatory program subject to Department oversight.</p> <p>The Legislature set ambitious organic waste diversion mandates on a short timeline and robust enforcement of regulatory requirements is essential to meeting those mandates.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p> <p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
1085	Bell, Kevin Placer County Public Works	As proposed, this section appears to prohibit facilities from rejecting organic waste from outside jurisdictions. It is imperative that facilities be able to control the source of materials and ensure processing capacity for the host jurisdiction or county	<p>Section 18990.1(c)(4) provides that this section does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery.</p> <p>Nothing in the regulations prohibits facilities from contracting with various parties, including jurisdictions, for capacity within their facility. What the regulations do prohibit is a jurisdiction adopting an ordinance or similar restriction to legally prohibit material from other jurisdictions from going to facilities within its boundaries simply because of where the material originated. This is consistent with existing case-law.</p>
1086	Bell, Kevin Placer County Public Works	We request that Section 18990.1(b)((2) be amended to clarify that it does not restrict a facility’s ability to implement flow control or other agreements to reserve organic processing capacity for local use and that nothing in the chapter forces a jurisdiction or facility to accept organic material outside its jurisdiction.	<p>Section 18990.1(c)(4) provides that this section does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery.</p> <p>Nothing in the regulations prohibits facilities from contracting with various parties, including jurisdictions, for capacity within their facility. What the regulations do prohibit is a jurisdiction adopting an ordinance or similar restriction to legally prohibit material from other jurisdictions from going to facilities within its boundaries simply because of where the material originated. This is consistent with existing case-law.</p>
1087	Bell, Kevin Placer County Public Works	It is common knowledge that California does not have sufficient infrastructure capacity today to handle the amount of organics to be diverted from landfills to meet the goals of AB 1826 and SB 1383. In addition to being costly, the facilities are	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included

Comment Number	Received From	Question/Comment	Response(s)
		difficult to site and can take several years to complete the permitting process. To place the responsibility of providing sufficient capacity entirely on local jurisdictions is not realistic. This effort will require both state involvement and funding.	provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
1088	Bell, Kevin Placer County Public Works	Organics capacity calculations – it is unclear if the existing online calculator will still be available.	A change to the regulatory text is not necessary because the comment is about an existing on/line tool, which will remain available.
1089	Bell, Kevin Placer County Public Works	The reporting timeframes in Section 18992.3 overlap in several cases, e.g. it is unclear why we would be required to plan and report twice with respect to the same period.	A change to the regulatory text is not necessary. CalRecycle has revised section 18994.2 in response to this comment. If a jurisdiction submits its initial compliance report pursuant to section 18994.1 by April 1, 2022, a jurisdiction may submit its first report, covering the period of January 1, 2022 through June 30, 2022, on October 1, 2022. The Department will conduct a mid-year review (6 months) of the jurisdiction's compliance and implementation with the requirements of this Chapter. This will allow CalRecycle an opportunity to assist jurisdictions in the implementation phase of the regulations. Most of the information required in the Annual Reporting can be assembled prior to the October 1, 2022 due date. The following Annual Report will cover January 1, 2022-December 31, 2022 and will be due August 1, 2023.
1090	Bell, Kevin Placer County Public Works	Jurisdictions must conduct community outreach on locations being considered. This is excessive, as there are existing CEQA and CalRecycle solid waste facility permitting processes that require public notification, including workshops, and input on new projects. This requirement should be deleted.	Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.
1091	Bell, Kevin Placer County Public Works	Facilities are difficult to site and can take years to get through the permitting process. CalRecycle must take actions to streamline permitting of new and expanded composting/organics facilities in order for jurisdictions to construct or expand facilities in time to meet regulatory timelines.	CalRecycle has noted the comment. This is not within the scope of the rulemaking. However, EA's should consult with their CalRecycle Permitting Point of Contact for any resources required for permit actions.
1092	Bell, Kevin Placer County Public Works	We recommend enforcement on jurisdictions be postponed if compliance cannot be achieved due to lack of capacity as a result of permitting challenges or if a facility refuses to guarantee access.	A change in the regulatory text is not necessary. The regulations are effective in 2022, allowing for ample time for planning for lack of capacity or infrastructure deficiencies. Currently, it is 2020 and jurisdictions have until 2022 to address any capacity deficiencies and if necessary, they can be placed on a Correction Action Plan that allows for an extended timeframe to come into

Comment Number	Received From	Question/Comment	Response(s)
			compliance. The regulations allow up to three years to come in to compliance on a CAP (in total this is effectively equivalent to the request five years).
1093	Bell, Kevin Placer County Public Works	CalRecycle should specifically coordinate with the California Air Pollution Control Officers Association, CalEPA, and other agencies that are aiming to “enhance decision making on organics materials management infrastructure”, which could add further permitting challenges to organics facilities, hindering the State’s and jurisdictions’ ability to meet SB 1383 requirements.	A change to the regulatory text is not necessary because the comment is outside the scope of the regulations. However, CalRecycle notes that it has already been working with the California Air Pollution Control Officers Association, CalEPA, and others on this issue.
1094	Bell, Kevin Placer County Public Works	18992.1(c)(4). As mentioned, the definition and use of the term “community composting” is confusing and should be clarified. If a community composting site is not a permitted composting operation, it is unreasonable to require jurisdictions to be aware of them and consult with them on capacity planning.	Community composting is a method for reducing landfill disposal of organic waste and CalRecycle determined that known community composting sites may be a useful element of finding local capacity that should be evaluated as an element of capacity planning.
1095	Bell, Kevin Placer County Public Works	We recognize that market development is a crucial component in meeting organics diversion goals. However, we do not believe that these regulations should be the vehicle to address this issue as there are no provisions for SB 1383 granting such an authority to CalRecycle, and respectfully request that the requirement for local jurisdictions to procure specified amounts of recovered organic waste products be eliminated from the proposed regulations.	<p>SB 1383 provides a broad grant of regulatory authority to the Department in Public Resources Code Section 42652.5, “The department, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that the Department may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, the Department also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where the Department successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream. Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
1096	Bell, Kevin Placer County Public Works	<p>However, should CalRecycle pursue this requirement, we specifically oppose assigning a specified procurement amount. The target does not consider the regional availability of these products or jurisdiction-specific needs. It is unreasonable to expect a jurisdiction to purchase more than their actual demand. We suggest instead requiring jurisdictions adopt green procurement policies that require a certain percentage of a jurisdiction’s purchases be recycled products, rather than a specified amount, similar to the requirements of Public Contract Code 12203.</p>	<p>The procurement requirements are designed to build markets for recovered organic waste products, which is an essential component of achieving the highly ambitious organic waste diversion targets mandated by SB 1383. CalRecycle developed an open and transparent method to calculate the procurement target that is necessary to help meet the highly ambitious diversion targets set forth by the Legislature. CalRecycle has also revised section 18993.1 to expand the list of eligible recovered organic waste products to provide jurisdictions with even more flexibility to choose product that fit local needs.</p> <p>Regarding the proposal to base the procurement target methodology on “actual need” CalRecycle disagrees. The comments submitted on this lack specific language for quantifying such an approach. Even if the commenter recommended a quantifiable way to determine “actual need”, California has over 400 diverse jurisdictions and it would be overly burdensome to account for each jurisdiction’s “actual need” and to develop a procurement target and enforcement policy for each one.</p> <p>Regarding revising the procurement approach to rely solely on jurisdictions’ voluntary purchases of recycled content products, CalRecycle disagrees. This approach would be insufficient to drive demand for recovered organic waste products on the scale necessary to help meet the ambitious targets required by SB 1383.</p> <p>However, CalRecycle also recognizes that, in some extraordinary cases, the procurement target may exceed a jurisdiction’s need for recovered organic waste products. Section 18993.1(j) provides jurisdictions with a method to lower the procurement target to ensure that a jurisdiction does not procure more recovered organic waste products than it can use. It can do this by</p>

Comment Number	Received From	Question/Comment	Response(s)
			showing that the amount of fuel, electricity, and gas for heating applications procured in the previous year is lower than the procurement target.
1097	Bell, Kevin Placer County Public Works	As currently written, a jurisdiction would be required to purchase material from itself to meet the requirements of this Article. Methods of compliance should instead include other landfill diversion activities, such as reuse. This would increase incentive for the jurisdictions to produce such products from their own waste stream and make use of those products. E.g., it is very common for parks and public works operations to grasscycle and to stockpile and reuse mulch generated from tree trimming operations, which achieves the same landfill diversion objectives.	The proposed regulatory text does not limit jurisdictions to the procurement of recovered organic waste products from “their” organics to satisfy the procurement requirements, nor do the products need to be consumed within the jurisdiction. The commenter states, “We believe a better approach would be to require a jurisdiction to use a certain amount of these types of materials.” This is essentially exactly what the procurement requirements do. A jurisdiction may procure from any entity provided the end products meet the Section 18982(60) definition of “recovered organic waste products”, and a jurisdiction may use the end products in a way that best fits local needs.
1098	Bell, Kevin Placer County Public Works	Mulch and other organic recycled products should also be allowable purchases.	Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.
1099	Bell, Kevin Placer County Public Works	Any procurement requirements need to also be applied to “non-local entities” (such as state agencies, public universities, etc.) and “local education agencies” (such as school districts, community colleges, etc.) as defined.	<p>Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor’s office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying</p>

Comment Number	Received From	Question/Comment	Response(s)
			procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.
1100	Bell, Kevin Placer County Public Works	More flexibility should be included for the purchase of other products made from recovered organic waste, including, but not limited to, other forms of renewable natural gas, electricity, and other recycled organic waste products as may be approved by CalRecycle. CalRecycle's position should be focused on promoting, rather than limiting, the use of organic waste products, including those that may be produced by non-combustion conversion technologies.	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>
1101	Bell, Kevin Placer County Public Works	CalRecycle should also focus more on developing markets where there is more potential, e.g. state agencies (e.g. CalTrans revegetation and slope stabilization), agriculture, horticulture, landscapers, turf producers, golf courses, nurseries, wetland creation, etc. As one example, the Healthy Soils Initiative, which includes targets for application of compost to sequester carbon and improve soil health, should be expanded or, at minimum, fully utilized. Since inception, the Legislature has allocated less than half of its annual funding received from the Greenhouse Gas Reduction Fund.	CalRecycle cannot impose procurement mandates on other sectors without the necessary statutory authority, which SB 1383 lacks. Regarding healthy soils, CalRecycle participated in development and implementation of the Healthy Soils Initiative (HSI) and assisted the California Department of Food and Agriculture (CDFA) in developing reimbursable compost application rates, estimating nitrate loads following compost application, developing the HSI grant application, and including compost application as an eligible soil management practice. While CalRecycle appreciates the ability to provide input, the HSI is ultimately under the regulatory authority of CDFA, not CalRecycle.

1102	Bell, Kevin Placer County Public Works	The record keeping and enforcement requirements are extremely burdensome and would require significant resources and cost. We respectfully request that all reporting be incorporated into the EAR already required for each jurisdiction. This would be more efficient than creating an entirely new reporting requirement and process just for the purposes of these regulations.	Comment noted. CalRecycle may consider streamlined jurisdiction reporting opportunities, such as modifying the Electronic Annual Report process.
1103	Bell, Kevin Placer County Public Works	Additionally, we are concerned with the provision of Section 18995.1(c) which, for the purpose of measuring compliance, mandates jurisdictions to generate a written report for each inspection, route review, and the name or account name of each person or entity. Some information from haulers to a jurisdiction is confidential and cannot be released to CalRecycle. We recommend jurisdictions be required to only provide CalRecycle with a general description of the route location, a general description of account reviewed, and a list of accounts determined by the jurisdiction to be subject to enforcement actions.	CalRecycle changed the requirement for a “written report” to a “written record” in 18995.1(c) to make clear that information gathered during inspections such as route reviews and compliance reviews is not required to be disclosed in a public report. These are written records that are to be maintained in the files of the local jurisdiction. To the extent that such information is valid confidential, proprietary, or trade secret information, there are protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow the appropriate withholding of such information from public disclosure by the jurisdiction.
1104	Bell, Kevin Placer County Public Works	The “Corrective Action Plans” allow extended timelines and milestones for achieving compliance, if the jurisdiction has demonstrated that it has made a “substantial effort” to comply. Substantial effort is then defined to mean that a jurisdiction has taken all practicable action to comply; however, the regulation clarifies that substantial effort does not include circumstances where a decision-making body of a jurisdiction has not taken the necessary steps to comply with the Chapter, including failure to provide staff resources or sufficient funding to assure compliance. We believe this is too severe. There are many factors a decision-making body must consider when establishing programs that are reasonable and economically feasible.	A change to the regulatory text is not necessary. This exclusion of the circumstance where a decision-making body of a jurisdiction has not taken action as “substantial effort” was to prevent delayed enforcement action due to a jurisdiction failing to take adequate steps to comply with the Chapter. The success of the Short-lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. This strict timeframe does not allow for a multi-year and multi-step process for achieving compliance or a “good faith effort” as with AB 939. Enforcement by the Department allows a jurisdiction extended timeframes to come into compliance through extensions and the Correction Action Plan (CAP). Absolving the jurisdiction of their responsibility to comply with the regulations due to the failure of a decision-making body would render the state incapable of achieving the SB 1383 targets. The jurisdiction is ultimately responsible for their compliance with the Chapter and shall be subject to penalties for noncompliance and the decision-making body will need consider the possibility of penalties if it fails to take the necessary steps to comply. By adopting the SB 1383 regulations as early as

Comment Number	Received From	Question/Comment	Response(s)
			<p>possible, impacted stakeholders will be provided the maximum amount of time to prepare and budget for implementation and compliance.</p> <p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a CAP. This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>
1105	Bell, Kevin Placer County Public Works	The requirement to provide access to records within one business day is unreasonable. There are a host of legitimate reasons that may prevent this standard from being met. We ask that this requirement be revised to be consistent with the Public Records Act, which provides 10 days.	CalRecycle has revised section 18995.2 (c) in response to this comment to allow for 10 business days rather than one.
1106	Bell, Kevin Placer County Public Works	In 18996.6, if CalRecycle finds that a state agency or state facility is violating Article 5 or Article 10 of this chapter, then the Department may simply "take progressive enforcement actions". The regulation places a disproportionate burden on counties and cities compared to state agencies. The regulation should include similar mandatory enforcement on state agencies as well.	A change to the regulatory text is not necessary. Under 1383, state agencies are treated as generators rather than implementation authorities and SB 1383 did not authorize the Department to issue penalties to state agencies. The Department will not be adding enforcement requirements on state agencies. Section 18996.6 states that the Department will oversee the compliance of state agencies in respect to SB 1383. Currently, state agencies are required to meet waste diversion goals like those required for cities, counties and regional agencies under AB75. State agencies and large state facilities must adopt integrated waste management plans, implement programs to reduce waste disposal and they have their waste diversion performance annually reviewed by the Department.
1107	Bell, Kevin Placer County Public Works	Pursuant to § 42653(a) of the PRC, CalRecycle and California Air Resources Board (not local jurisdictions) are responsible for identifying the barriers to organic waste recycling, the status of new organics recycling infrastructure development, the commitment of state funding to support infrastructure expansion, the progress in reducing regulatory barriers to the siting of organics recycling facilities, the timing and effectiveness of policies that will facilitate the permitting of organics recycling infrastructure, and the status of markets for the products generated by organics recycling facilities. Therefore, we would respectfully request that the regulatory language include allowances for jurisdictions and other entities that demonstrate a substantial effort to comply with the regulations but are unable to do so due to such factors outside of their control.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
1108	Bell, Kevin	We are disappointed that the proposed regulations fail to incorporate provisions for a jurisdiction demonstrating a "good faith effort" to comply with SB 1383 organic	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB

Comment Number	Received From	Question/Comment	Response(s)
	Placer County Public Works	waste landfill reduction mandates. Specifically, SB 1383 {Public Resources Code § 42652.5(a)(4)} states, “The department shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825, the amount of organic waste disposed compared to the 2014 level, per capita disposal rates, the review required by Section 42653, and other relevant information provided by a jurisdiction” (emphasis added). PRC Section 41825 establishes the process to be used by CalRecycle in evaluating a jurisdiction compliance with State mandated recycling goals. The process requires CalRecycle to consider “good faith efforts” by the jurisdiction in making its determination of the jurisdiction progress (emphasis added). Furthermore, as stated in PRC Section 41850(b), CalRecycle is required to make a determination as to whether a jurisdiction has made a good faith effort to comply with the recycling mandates before imposition of any administrative penalties on the jurisdiction. We therefore request the proposed regulation be expanded to include provision for CalRecycle to consider the “good faith effort” of a jurisdiction to comply with organic waste landfill reduction mandates.	1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
1109	Bell, Kevin Placer County Public Works	Alternatively, we request that CalRecycle revise the definitions of “substantial effort”, “extenuating circumstances”, and “critical milestones” as define Section 18996.2(a) to be consistent with provisions of PRC Sections 41821, 41824, and 41850.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction.
1110	Bell, Kevin Placer County Public Works	Additionally, we are greatly concerned with the proposed definition of “critical milestones” as written in Section 18996.2(a)(2)(D), which reads, “critical milestones” means all actions necessary for a jurisdiction to comply, including, but not limited to, receiving all approval by decision-making bodies, permit application submittals and obtaining approvals, and tasks associated with local contract approvals”. This is an impossible task – no local government or any state agency can guarantee that they can receive “all decision-making bodies” (e.g. State) approval – and needs to be deleted.	A change to the regulatory text is not necessary. This exclusion of the circumstance where a decision-making body of a jurisdiction has not taken action as “substantial effort” was to prevent delayed enforcement action due to a jurisdiction failing to take adequate steps to comply with the Chapter. The success of the Short-lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. This strict timeframe does not allow for a multi-year and multi-step process for achieving compliance or a “good faith effort” as with AB 939. Enforcement by the Department allows a jurisdiction extended timeframes to come into compliance through extensions and the Correction Action Plan (CAP). Absolving the jurisdiction of their responsibility to comply with the regulations due to the failure of a decision-making body would render the state incapable of achieving the SB 1383 targets. The jurisdiction is ultimately responsible for their compliance with the Chapter and shall be subject to penalties for noncompliance and the decision-making body will need consider the possibility of penalties if it fails to take the necessary steps to comply. By adopting the SB 1383 regulations as early as

1111	Bell, Kevin Placer County Public Works	<p>We struggle to identify the statutory authority for CalRecycle to require local jurisdictions to impose penalties on generators for noncompliance. We believe Section 42652.5(a)(1) however, is clear that the department "may authorize" jurisdictions to impose penalties, but does not provide authority to the department to mandate that jurisdictions impose penalties, and certainly does not provide authority for such prescriptive regulations. This portion of the statute provides many areas of authority to the department, and it is incredibly precise in its phrasing, using "may require", "may authorize", "shall include", and "may include", among others, to describe the precise authority being granted to the department for specific actions. Again, we respectfully point out that the statute seems to give authority to CalRecycle to "authorize" penalties, but not mandate them.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, "CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code." That section also provides that CalRecycle may "include different levels of requirements for local jurisdictions..."</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, "The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code." SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that "[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. '[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .'. The [administrative agency] is authorized to 'fill up the details' of the statutory scheme."</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
1112	Bell, Kevin Placer County Public Works	However, if pursued by CalRecycle, the penalty system as proposed is too extensive and premature and should be considered in a separate set of regulations at a later date. The requirements are complicated and will be difficult to implement and administer. Jurisdictions have until 2022 to implement the programs, so there is ample time to consider appropriate levels of penalties after implementation of these regulations. We recommend removing all enforcement until the feasibility of program and infrastructure implementation can be evaluated.	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations “may include penalties to be imposed by the Department.” This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.
1113	Bell, Kevin Placer County Public Works	As in other sections of this regulation, this Article places a disproportionate financial burden on counties and cities. As an example, there are 66 fineable offenses CalRecycle can impose on generators and jurisdictions, but no financial penalty is proposed to be placed on State agencies that fail to comply. It will be very difficult for jurisdictions to justify such a prescriptive set of penalties onto our residents and businesses when the State entities, federal agencies, and schools, who are large	This comment referred to a penalty table that was deleted in later versions of the regulatory language. Authority to impose penalties on state agencies is unclear in the SB 1383 statute.

Comment Number	Received From	Question/Comment	Response(s)
		contributors to the organic waste stream, only get put on a “non-compliance list” for failure to comply.	
1114	Bell, Kevin Placer County Public Works	There must be some consideration in the regulation for the National Sword impacts, particularly in regard to its impact on paper markets. The market changes have required jurisdictions to amend their programs and outreach and facilities to change their processing and marketing. Jurisdictions should not be penalized for market conditions that are out of their control.	The commenter is expressing an opinion regarding the overall scope of the rulemaking and how National Sword may impact implementation. The comment is not suggesting particular changes to the regulatory language and it is unclear what the impact is on paper markets and how the regulations should address that. Comment noted.
1115	Bell, Kevin Placer County Public Works	There are already existing methods in place for CalRecycle to enforce diversion program implementation. Adding another method and level of oversight and enforcement is unnecessary and will cost the State (in terms of staffing and overall effort) costs which will ultimately be passed down to jurisdictions and local ratepayers. We recommend removing this unnecessary requirement.	A change to regulatory text is not necessary. The California legislature has recognized the need for the Department to have oversight and enforcement authority over jurisdictions who have a role in carrying out organic recycling requirements to meet the state’s mandates. This approach mirrors CalRecycle’s delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence.
1116	Bell, Kevin Placer County Public Works	CalRecycle has indicated they have included flexibility in the enforcement requirements. Nearly 20 pages of enforcement and oversight procedures and mandatory fines are not flexible; it is State oversight at an unreasonable and unprecedented level.	A change to the regulatory text is not necessary. The success of the Short-lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. This strict timeframe does not allow for a multi-year and multi-step process for achieving compliance or a “good faith effort” as with AB 939. The legislature included specific language that the regulations may include policies and requirements that impose penalties on regulated entities and require jurisdictions to impose requirements on regulated entities. Enforcement by the Department allows a jurisdiction extended timeframes to come into compliance through extensions and the Correction Action Plan (CAP). The jurisdictions may adopt ordinances and mechanisms that must at least meet the minimum standard of the regulations. These ordinances may give the jurisdiction more flexibility to be more stringent should local regulations have additional requirements. The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a CAP. This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
1117	Bell, Kevin Placer County Public Works	Upon receipt of an accusation, a jurisdiction has only 15 days to file a request for hearing, or will automatically waive its rights to a hearing. Jurisdictions need more time to respond. It not only takes time to receive and route mail in an agency, it will take time to determine which department is responsible, evaluate the issue, consult	Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.

Comment Number	Received From	Question/Comment	Response(s)
		with legal counsel, and prepare a response. The regulation should allow at least 90 days for a jurisdiction to respond.	<p>Regarding soil amendments and adding an option for approval of “future technological and product developments”, CalRecycle disagrees due to lack of conversion factors and uncertain landfill diversion of feedstock for these products. The broad range of “soil amendments” and “future technological and product development” raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors. CalRecycle has also added language to clarify that procured compost must be from a permitted or authorized compostable material handling operation or facility or a permitted large volume in-vessel digestion facility which will mean that the compost will be required to meet environmental health standards in Title 14, including for pathogens, metals, and physical contaminants. If soil amendments meet that criteria, they may be considered compost.</p> <p>Regarding posting a list of approved products, once the regulations are finalized CalRecycle will develop tools to aid jurisdictions with procurement-related questions, including examples of eligible recovered organic waste products.</p>
1118	Bell, Kevin Placer County Public Works	This Article contains several requirements for sampling and load checking on a daily basis. We appreciate a goal of better understanding the waste streams and residue levels after processing. However, the typical waste stream at a facility does not vary drastically over short periods of time and it stands to reason that such waste composition studies and load checks could be conducted much less frequently and still provide representative data. The WPWMA is currently utilizing a waste composition study consultant, the cost of which is \$5,000 per day to conduct 48 physical and visual samples/measurements. The WPWMA estimates the new requirements could equal or exceed these costs and provide no better data than potentially larger-scale semi-annual measurement.	CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
1119	Bell, Kevin Placer County Public Works	We appreciate the revision to include an LEA-approved equivalent alternative to the 36” earthen material requirement. However, it is unclear if CalRecycle has evaluated use of 36” earthen material in reducing methane emissions and provided evidence that this practice is “necessary to limit greenhouse gas emissions from landfills” and “allow for greater landfill gas collection and biogenesis”, as indicated in the Initial Statement of Reasons. In the absence of justification, CalRecycle should maintain the current requirement.	CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments. The section was removed and the requirement was included as part of the Status Impact Report (SIR). The SIR was amended to add the requirement to identify areas in the landfill that would remain with intermediate cover. The addition of this requirement to the SIR ensures that areas with intermediate cover are maintained to meet the intermediate cover criteria of controlling the infiltration of precipitation into waste, vectors, fires, odors, blowing litter, and scavenging to reduce threats to public health and safety and the environment.
1120	Bell, Kevin Placer County Public Works	The various daily sampling requirements for each separate organic waste type are excessive. It would require significant space and is not related to the amount of waste accepted. Operators should have flexibility on how to implement sampling for contamination.	CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine

Comment Number	Received From	Question/Comment	Response(s)
			<p>the level of efficiency of a facility to separate organic material for recycling. The operator will now be taking composite samples for 10 consecutive days per reporting period, which is on a quarterly basis. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
1121	Bell, Kevin Placer County Public Works	In addition, the regulation should clarify that facilities located in jurisdictions that have waivers should not be required to conduct sampling.	A change to the regulatory text is not necessary. Waivers would provide certain jurisdictions a waiver from organic waste collection service, education, and enforcement if the jurisdictions meet the requirements of the waiver. A jurisdiction that is granted a waiver would not be collecting the waste and therefore the waste would not be sent to the facility. In addition, a facility or operation located in a jurisdiction that was granted a waiver is not exempt from complying with measurement requirements.
1122	Bell, Kevin Placer County Public Works	For processing facilities to construct, expand, and process additional types and volumes of organic wastes, CalRecycle needs to ensure that facilities are protected from odor complaints, increasing regulations, and contamination standards.	CalRecycle has noted the comment. This is not within the scope of this rulemaking.
1123	Bell, Kevin Placer County Public Works	Section 21695 Landfill operators are required to submit a Status Impact Report to CalRecycle within 180 days followed by CalRecycle review, findings, reports to the Enforcement Agency, etc. It would be much more reasonable for the regulation to simply require that an operator submit a Joint Technical Document amendment, if needed, within the timeframes required in existing regulation. The additional detail is not necessary.	<p>CalRecycle has revised Section 21695 in response to comments. The changes to the regulatory text include the requirement that operators identify those areas in the landfill that would remain with intermediate cover and to extend that date for submittal of the Status Impact Report (SIR) from 180 days to one year (365 days) from the effective date of these regulations.</p> <p>A Joint Technical Document (JTD) is an operational document that is maintained to reflect the current day to day operations at the landfill. Whereas, the SIR is a site specific, one-time submittal that is prepared by the operator after they have reviewed their landfill operations to determine any potential impacts from the reduction of organic disposal (waste flow) to their landfill. The SIR is intended to assist the operator in determining and assessing in the timing of those impacts in order to properly plan for changes or modifications to the landfill. The results of the SIR will determine if an amendment to the JTD is needed. Because only the potential impacts associated with the reduction of the amount waste disposed will be reviewed, staff believe that one-year from the effective date of the regulations is an adequate amount of time for the operator to meet the requirements of this section.</p> <p>In addition, this section provides a list of items to be considered by the operator in order to assist them complete the SIR. This information in items listed is needed in order to adequately evaluate the potential impacts to the landfill resulting from the reduction of organic disposal at landfills. If there will be no changes to a particular item, then a statement to that effect would be adequate.</p>

Comment Number	Received From	Question/Comment	Response(s)
1124	Bell, Kevin Placer County Public Works	We appreciate the addition of the “Mixed Organic Waste Stream” in an attempt to provide clarification as to what materials are collected in the container systems and to be diverted by a High Diversion Organic Waste Processing Facility. However, it would be clearer still if this definition was included in Chapter 12, Article 1 and specified the materials to be collected in the stream	A change to the regulatory text is not necessary. The term “mixed waste organic collection stream” is used in 14 CCR Chapter 3 - Transfer/processing operations and facilities. This definition is applicable to any activity that falls within this Chapter.  Furthermore, the term is defined by how the material is collected. Making the definition more descriptive by listing all the material that can be collected in the blue or gray containers is unnecessary because it will depend on the type of organic waste collection service in that jurisdiction as defined in Sections 18984.1, 18984.2, and 18984.3.
1125	Bell, Kevin Placer County Public Works	We recommend a descriptive definition, e.g. “Mixed Organic Waste Stream means organic wastes collected in a blue container or a gray container...and that are not prohibited container contaminants, as defined, to be transported to a High Diversion organic waste processing facility and includes food, green material, landscape and pruning waste, lumber, wood, paper products, printing and writing paper.”	A change to the regulatory text is not necessary. The term is defined by how the material is collected. Making the definition more descriptive by listing all the material that can be collected in the blue or gray containers is unnecessary because it will depend on the type of organic waste collection service in that jurisdiction as defined in Sections 18984.1, 18984.2, and 18984.3.
1126	Bell, Kevin Placer County Public Works	We recommend this definition not include textiles and carpets, manure, biosolids, digestate, and sludge for reasons noted in other comments.	The statute requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.
3644	Berkman, K., City of El Segundo	Section 18984.7 -This section requires that containers at the end of their useful life are replaced with SB 1383 color-compliant containers. This may lead to conflicts with current color schemes, or at a minimum may lead to containers of inconsistent colors throughout a jurisdiction. Inconsistent coloring dispersed throughout jurisdiction makes education and outreach a challenge as customers with different colored containers will require different messaging. Furthermore, this approach does not consider current container inventories that have already been procured to replace containers at the end of their useful life. The City recommends that CalRecycle eliminate the need to replace containers at the end of their useful life with SB 1383 co/or-compliant containers, and instead mandate that all containers comply with the color requirements described above by 2032. This will allow jurisdictions to utilize current container inventories and allow for a uniform replacement of new containers and messaging throughout the jurisdiction.	Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products. Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations

Comment Number	Received From	Question/Comment	Response(s)
			allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life. Jurisdictions may use inventory purchased prior to 2022.
3652	Berkman, K., City of El Segundo	<p>Section 18992.1(c)(2)(A) - This section requires that counties, in coordination with their cities, estimate the amount of organics disposed, the amount of verifiably available organics recovery capacity, and the estimated additional capacity needed to comply with state goals, through consultation with the Enforcement Agency, the local task force, haulers, facility operators and owners, and community composting facilities. The City believes that the capacity planning process tasked to counties and cities described in this section is critical to ensuring that California "right sizes" its investment in organics infrastructure and can rely upon the information generated by this process for future planning. The methodology proposed is generally reasonable and the flexibility to use other reasonable methods of estimation, where appropriate, will allow jurisdictions to approach this exercise in different ways based on local needs and conditions. That said, the completeness and accuracy of the data collection is entirely dependent upon the cooperation of and provision of data by the facilities in question. All too often, processing facilities provide incomplete information in response to capacity studies or simply decline to participate at all. If CalRecycle intends to require that public agencies conduct the process described herein, it seems reasonable to require participation and provision of accurate information by the facility operators. While this subsection requires that entities contacted respond to the jurisdictions request, there are no mandatory timeframes or prescribed penalties for their inability or unwillingness to comply.</p> <p>The City recommends establishing a timeframe in which entities must reply to jurisdictions, as well as an enforcement mechanism (perhaps an addition to Article 16). Ideally, CalRecycle would handle the enforcement of this since many jurisdictions may be seeking information and capacity outside of their jurisdiction, which impacts their ability to legally enforce any fines levied.</p>	Thank you for the comment. CalRecycle has revised Section 18992.1 by adding a new subsection (Section 18992.1(c)(2)(A) to add a 60-day requirement for entities to provide the required information to jurisdictions.
3645	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Article 1 - Definitions</p> <p>Section 18982(a){51} - This section includes "building insulation and panels" in the definition of paper products. Unlike the other materials included in the definition of paper products, building insulation and panels are most frequently not made of paper. In addition, some insulation has a single paper backing to fiberglass layers which is not practically separable from the fiberglass. Since the regulations of "organic waste" includes paper products, the inclusion of building insulation may lead to confusion and potential contamination.</p> <p>The City recommends that "building insulation and panels" be removed from this definition. Alternatively, the definition could be enhanced to specify which types of insulation and panels are included (e.g. compostable insulation).</p>	CalRecycle has revised Section 18982(51) in response to this comment. The changes include the deletion of "building insulation and panels" from the Paper Products definition. The change clarifies that these products are excluded from the definition and are not part of the suite of options available to a jurisdiction for purchasing recycled content and recyclable paper. While CalRecycle has made the recommended change, it should be noted that the broad range of products listed in the Paper Products definition is intended to provide more flexibility to jurisdictions in terms of the paper products eligible for purchase. However, CalRecycle recognizes that building insulation and panels would likely not meet the requirements for recyclability specified in Section 18993.3(c)(2) and therefore agrees with the proposed revision.

Comment Number	Received From	Question/Comment	Response(s)
3646	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Article 3 - Mandatory Organic Waste Collection</p> <p>Section 18984.l(a){S}{A} - This section states that carpets, non-compostable paper and hazardous wood waste are prohibited from being placed in the green container. This subset is limited in scope and should be expanded. Currently the California Department of Food and Agriculture (COCA) restricts movement of certain organics within quarantine zones and this material should not be included in the green containers. This is addressed elsewhere in the proposed regulation text for non-local entities and at the facility level when measuring organic recovery rates, but not at the point of collection.</p> <p>The City recommends that CalRecycle amend the list of prohibited materials to include "material subject to a quarantine on movement issued by a county agricultural commissioner." Alternatively, the definition of organic waste in Section 18982(0)(46) could be amended to state "material subject to a quarantine on movement issued by a county agricultural commissioner is considered incompatible materials rather than organic waste."</p>	Thank you for the comment. CalRecycle added language in Section 18984.13 to address quarantined waste.
3648	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Section 18986.l(a){l}(A) - This section states that textiles, carpets, plastic coated paper, and human or pet waste may not be collected in the blue container for non-local entities. This requirement appears to be incongruent with the requirements placed on local entities. The City recommends that CalRecycle amend the definition to align with the requirements placed on jurisdictions in Sections 18984.1 and 18984.2.</p>	Thank you for the comment. CalRecycle amended the applicable sections for consistency.
3651	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Section 18990.1.l{b}(2) - The provisions of this section appear to prohibit a local agency from reserving available capacity at a facility for generators in that jurisdiction. If a local agency provides the funding and/or assurance of material flow that enables the development of organics processing infrastructure, that agency should, reasonably, have the ability to reserve that infrastructure for the benefit of their constituents and/or ratepayers. Additionally, if a local agency acts as a host for an organics processing facility and accepts the real and perceived negative impacts of such facilities on the community, it seems reasonable that the agency should be entitled to establish "host mitigation fees" on materials originating outside that jurisdiction. These sorts of fees are common in the solid waste industry in California and may tend to reward communities that are willing and able to overcome "NIMBY" concerns.</p> <p>The City recommends eliminating or clarifying the provisions of this subsection. The City would particularly like to see the ability to reserve capacity for facilities partially or fully funded by the jurisdiction.</p>	Read together, section 18990.1 (b) (3) prohibits a local ordinance that restricts flow, and section 18990.1 (c) (4) allows for contractual relationships, which does not restrict the flow of materials. Furthermore, section 18990.1 (c) (1) allows facilities to reject organic waste from outside jurisdictions that does not meet quality standards established by a facility or operation, and section 18990.1 (c) (2) allows a jurisdiction to arrange for reserved capacity at a facility for organic waste from the jurisdiction. A change to the regulatory text is not necessary.
3654	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Section 18982(a)(65) - This section defines a route review as visual inspection of containers along a hauler route for the purpose of determining container contamination. Without specifying a minimum quantity of inspections per route, the regulations may result in a "race to the bottom" where haulers or jurisdictions are inspecting minimal containers per route. Another concern is an inconsistent</p>	Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure

Comment Number	Received From	Question/Comment	Response(s)
		<p>interpretation or application of the minimum standards by Local Enforcement Agents.</p> <p>The City recommends that CalRecycle amend this definition or the corresponding enforcement section {18984.5} to specify a minimum percentage of containers or customers along the route to be inspected. This approach will allow for a consistent application of the regulations across jurisdictions and ensure that the intent of this section is realized.</p>	<p>overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction.</p>
3655	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>General - This article will require a significant expenditure by jurisdictions throughout California to staff the enforcement efforts, including but not limited to: route reviews, compliance reviews, contamination monitoring, follow-up site visits, and the issuing of fines. Some agencies will choose to hire staff or incorporate these responsibilities into the work performed by existing code enforcement officers and/or health inspectors. In some agencies, there may not be a sufficient workload created by these requirements to justify a full time position. In yet other agencies, there may be political objections to funding staffing for this type of enforcement when other critical public health and safety matters are under-enforced. During the enforcement workshop, Cal Recycle suggested the potential for CalRecycle to perform the enforcement on behalf of agencies, similar to how agencies can arrange for CalRecycle to be the Local Enforcement Agency for regulating solid waste facilities. The City recommends that Ca/Recycle provide an option for jurisdictions to contract with CalRecycle to perform the inspection and enforcement procedures.</p>	<p>A change to the regulatory text is not necessary. CalRecycle will not be contracting with jurisdictions to perform inspection and enforcement actions. There are insufficient resources at the state level to contract out for jurisdictions.</p>
3657	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Section 18997.2(d) -This section states that the penalty amount for each violation (subject to range limitations) will be determined through a qualitative process. It is likely that the current process will result in an uneven application of fines across jurisdictions. Furthermore, the consideration of "the ability for a violator to pay" under Section 18997.2(d) seems to bias the amount of fines based on a jurisdictions financial position. The City recommends that this section be amended to include a quantifiable formula for determination of fines that eliminates subjectivity and the potential for inconsistent application. For example, the severity of a fine within the currently prescribed range could be tied to the population of a jurisdiction. Alternatively, the base tables in Section 18997.2(c) could be changed to singular figures, as opposed to ranges, eliminating the current subjectivity. The fine structure is already progressive for subsequent failures to comply and therefore negates the need to assess the penalties based on the "willfulness of a jurisdiction's misconduct."</p>	<p>A change to the regulatory text is not necessary. Section 18997.3(d) has been changed to 18997.3(c) due to deletion of the penalty tables and the addition of the new penalty structure outlined in section 18997.3(b). The factors listed in Section 18997.3(c) are commonly used when determining a penalty amount. The penalty range may be used to consider aspects such as but limited to, the population of a jurisdiction. CalRecycle will not be including a quantifiable penalty formula in the regulations.</p>
3658	Berkman, K., City of El Segundo, Olmos, T., City of Brea	<p>Section 18997 .S(d) -This section states that upon receipt of an accusation of violation, a jurisdiction has 15 days to file a request for a hearing. Additionally, this section prescribes an expedited time frame for imposition of penalties, leaving jurisdictions little time to investigate potential violations and respond thoughtfully. Given that responsibilities may be designated to haulers or other entities, it is even more unlikely that a thoughtful response could be drafted within the mandated timeframes.</p>	<p>The 15 day window for requesting a hearing is modeled on the timeline for regulated solid waste facilities in Public Resources Code Section 44310. Provisions were included in Section 18994.1 for jurisdictions to report the primary contact person in the jurisdiction and the agent for service of enforcement process, if different. The purpose of these provisions was to ensure that enforcement process is routed to the proper individual within a jurisdiction. It is incumbent upon that individual to ensure the process material is routed efficiently and appropriately. In addition, the commencement of a penalty proceeding is only allowed to occur following a notice of</p>

Comment Number	Received From	Question/Comment	Response(s)
		The City recommends that jurisdictions receive a minimum of 45 days to investigate the accusation and request a hearing.	violation process in which the jurisdiction will be on notice with an opportunity to correct. By the time a penalty accusation is served, a jurisdiction should be aware of a violation and the issues involved and the informational bar for requesting a hearing is set low.
3659	Berkman, K., City of El Segundo, Olmos, T., City of Brea	Section 18997.5(e) - This section states that if a party waives their right to a hearing, there is a potential to enter a settlement agreement. It is unclear how the settlement process could or should be conducted. The City recommends that this section be amended to provide guidance and parameters for settlements, or at a minimum contains a reference to the appropriate document that does provide this information.	A change in the regulatory text is not necessary. It is unclear on what parameters the commenter is suggesting, but in general, adding such parameters to the language may unduly restrict the discretion of the parties in reaching adequate settlement.
6210	Bernal, M., City of Santa Cruz	Infrastructure Capacity: As we have noted, California lacks sufficient capacity today to be able to meet the needs for new organic material processing. Many cities have expressed concern over an inability to comply with organic diversion requirements due to a lack of organic processing infrastructure. There is an uneven distribution of organic processing infrastructure, such as bio-digesters, across the State. Moreover, where the infrastructure does exist, capacity is limited. While the regulation provides five years to implement programs, cities are concerned that this is not sufficient time to develop and permit new facilities.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
6211	Bernal, M., City of Santa Cruz	Funding: Lack of sufficient funds continues to be among the major challenges local governments face in the effort to implement new organic material diversion programs. The City and other communities continue to seek solutions to address the need for substantial public sector funding. For example, "Cap-and-Trade" proceeds can be used to help offset the costs for developing organic recycling infrastructure. However, even if additional appropriations were made to the Waste Diversion Program, it will not address much of the local need. Local governments, like ours, continue to work to address the need for funds to undertake prescribed activities, such as updating bins and labels, as well as providing education and outreach.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). 			a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
6212	Bernal, M., City of Santa Cruz	Enforcement: These regulations allow for Corrective Action Plans and establish extended timelines and milestones for achieving compliance. We appreciate the addition of a pathway to compliance. This is a step in the right direction, and we urge careful consideration of the differences among local jurisdictions, as well as the variety of community stakeholders, and infrastructure challenges a local jurisdiction may face.	Comment noted, the comment does not recommend a regulatory change.
6213	Bernal, M., City of Santa Cruz	Penalties: The penalties outlined in these regulations are premature. If the purpose of penalties is to ensure generators are sufficiently deterred from noncompliance, this regulation puts the cart before the horse by designing penalties before the sticking points and needs of generators are understood. We encourage CalRecycle to continue working through the programmatic scheme before implementing an appropriate set of penalties, particularly since programs have until 2022 to be implemented. Just the sheer volume of proscribed penalties, currently at 81, begs for additional scrutiny. We ask that CalRecycle adopt penalties in a second set of regulations to take effect at a future date.	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations "may include penalties to be imposed by the Department." This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for 5053 waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.
6214	Bernal, M., City of Santa Cruz	Procurement: New procurement requirements in these proposed regulations require local governments to purchase recovered organic material products by targets set by CalRecycle. We anticipate these requirements will result in substantial additional costs to local governments, over and above the costs we already anticipate to comply with the extensive programmatic requirements of the proposed regulations. We ask that CalRecycle instead work to develop markets for such materials in a second regulatory proceeding.	A change to the regulatory text is not necessary. The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in "substantial additional costs". CalRecycle disagrees with the suggestion to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved. However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022.
6215	Bernal, M., City of Santa Cruz	The City further notes that the additional costs that will result from complying with the procurement regulations represent an unfunded State mandate under Cal. Const. Art. XIII B, Sec. 6(a), as the regulations would impose a new program on cities	CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.

Comment Number	Received From	Question/Comment	Response(s)
		<p>and neither the draft regulations nor the Initial Statement of Reasons identifies a State funding source. CalRecycle should not rely on the fee authority granted to local jurisdictions in SB 1383. Any fee that a city attempted to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, Sec. 1 ( e) (Prop. 26), as it would not meet any of the exceptions identified in that section. Further, even were a fee to survive scrutiny under Prop. 26, it is questionable whether a city would have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII D, Sec. 6 (Prop. 218.). This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929). For these additional reasons, the City requests that the procurement regulations be addressed in a separate regulatory proceeding.</p>	<p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, “No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.” Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a “tax” under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
6024	Berteau, C., Citizen - Oakland	SB 1383 would make sending organic material across property lines illegal because cities have exclusive contracts with corporate haulers.	No change to the regulatory text is necessary. The commenter has not requested a change to the text and it is unknown what is meant by sending organic material across property lines or what that has to do with corporate hauler contract. Nothing in the regulations prohibits sending organic material across property lines.
6025	Berteau, C., Citizen - Oakland	Why cant we have small local composting facilities who carefully nurture rich microbial compost that will truly benefit the soil? Please trust the people to create really good compost on a smaller scale. Protect our right to carry organics from our garden to a local composting facility or to have them pick it up.	This comment proposes to add the definitions of ‘Community Benefit Composting’ and ‘Micro-composting’ to Article 1, thereby creating two additional categories of composting that do not reference the size and volume limitations of Section 17855(a)(4). The proposed terms for these two activities would expand the suite of activities that are not excluded from regulatory requirements. CalRecycle is not proposing amendments to the compost size thresholds in Section 17855, therefore the comment is not germane to the text CalRecycle is adopting or amending. The existing exclusion thresholds were thoroughly vetted and subject to stakeholder comment in a previous rulemaking amending those standards. No change to the regulatory text is necessary

Comment Number	Received From	Question/Comment	Response(s)
			to specifically mention community composting because Section 18990.1(b) establishes that a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that would prohibit the lawful processing and recovery of organic waste. Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.
4	Bigham, B,	Section 18982 (a)(46) "Organic waste" means solid wastes containing material originated from living organisms and their metabolic products, including but not limited to food, green material, landscape and pruning waste, organic textiles and carpets, <b>petroleum contaminated soil and sorbents</b> , lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges.	A change to the regulatory text is not necessary. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). Section 18982(a)(46) defines what material is considered organic waste for the purpose of these requirements. Organic waste includes solid waste containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscaping and pruning waste, organic textiles and carpet, lumber, wood, paper produce, print and writing paper, manure, biosolids, digestate and sludge.
5	Bigham, B,	Section 20700.5(a) Compacted earthen material <b>free of VOC contamination</b> at least 36 inches <b>in depth</b> shall be placed on all surfaces of the fill where no additional solid waste will be deposited within 30 months to control methane emissions. (1) The EA may approve, with concurrence by the Department, an alternative long-term intermediate cover if the operator demonstrates that the alternative is equivalent to 36 inches of earthen material <b>and free of VOC-contamination</b> .	CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments. The section was removed and the requirement was included as part of the Status Impact Report (SIR). The SIR was amended to add the requirement to identify areas in the landfill that would remain with intermediate cover. The addition of this requirement to the SIR ensures that areas with intermediate cover are maintained to meet the intermediate cover criteria of controlling the infiltration of precipitation into waste, vectors, fires, odors, blowing litter, and scavenging to reduce threats to public health and safety and the environment.
6	Bigham, B,	I recommend that the regulations incorporate a state-wide ban on the acceptance by landfills of any contaminated soil containing VOC levels of 50 ppm or greater. I further recommend that a lower state-wide VOC level less than 50 ppm be considered to further meet the SLCP goals. This lower limit should be consistent with the VOC restrictions of neighboring Air Districts to eliminate the unseemly transportation of VOC emissions to jurisdictions with lax local restrictions on VOC emissions.	CalRecycle has noted the comment. Banning soil with VOC greater than 50 ppm is under the Air Districts authority and not the purpose of SB 1383. This is not within the scope of this rulemaking.
7	Bigham, B,	There is a practical advantage to CalRecycle in the incorporation of this proposal – it can be implemented with minimal disruption to the landfills. The discontinuation of the use of VOCcontaminated soil as cover material could be accomplished quickly since the materials and technologies (covers, foams, clean soil, auto shredder waste) are already in place to do this. This would allow the Department to demonstrate to the California State Legislature tangible progress towards implementation of SB 1383. Further, because of the large volumes of contaminated soil currently going to landfills, this gives CalRecycle a major component in the 50% reduction requirement in the disposal of organic waste to landfills by 2020, as required by the statute. This is also consistent with Section 39730.6 (2) (b) restricting regulation of methane emissions at landfills.	CalRecycle has noted the comment. Banning soil with VOC greater than 50 ppm is under the Air Districts authority and not the purpose of SB 1383. This is not within the scope of this rulemaking.

3021	Bilderian, S., City of Twentynine Palms	Procurement: New procurement requirements in these proposed regulations require local governments to purchase recovered organic waste products targets set by CalRecycle. We anticipate these requirements will result in substantial additional costs to local governments, over and above the costs we already anticipate to comply with the extensive programmatic requirements of the proposed regulations. We ask that CalRecycle instead work to develop markets for such materials in a second regulatory proceeding. The City of Twentynine Palms further notes the additional costs that will result from complying with the procurement regulations represent an unfunded state mandate under Cal. Const. Art. XIII B, sec. 6(a) as the regulations would impose a new program on cities and neither the draft regulations nor the Initial Statement of Reasons identifies a state funding source. CalRecycle should not rely on the fee authority granted to local jurisdictions in SB 1383. Any fee that a city attempted to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, sec. 1 (e) (Prop. 26) as it would not meet any of the exceptions identified in that section. Further, even were a fee to survive scrutiny under Prop. 26, it is questionable whether a city would not have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII 0, sec. 6 (Prop. 218.) This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929). For these additional reasons, The City of Twentynine Palms requests that the procurement regulations be addressed in a separate regulatory proceeding.	CalRecycle has determined that the procurement requirements are necessary to achieve organic waste diversion targets by ensuring an end-use for processed organic waste. In addition, CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate. First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)). Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe "any fees" that may in the future be imposed by the numerous local jurisdictions in California as "likely" to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383. According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate. Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.

Comment Number	Received From	Question/Comment	Response(s)
			CalRecycle disagrees with the suggestion to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved.
3005	Blanco, E., Fairfield Public Works Department	Edible Food - Is this referring to donations of uneaten food from events or restaurants to shelters or group homes, will there be a difference in reporting.	In Article 1 of the regulations edible food is defined as food intended for human consumption. The definition also includes language that specifies that the purposes of these regulations, edible food is not solid waste if it is recovered and not discarded. In addition, nothing in this chapter requires or authorizes the recovery of edible food that does not meet the food safety requirements of the California Retail Food Code. It is unclear what the commenter was referring to regarding a difference in reporting. If the commenter was asking if there will be a difference in reporting for shelters and group homes the answer would be it depends. Only food recovery organizations and food recovery services that contract with or have written agreements with commercial edible food generators pursuant to Section 18991.3 (b) are required to report the total pounds collected from commercial edible food generators in the previous calendar year to the jurisdiction.
3006	Blanco, E., Fairfield Public Works Department	Please food inspection for health and safety are managed by the County LEA not per city as noted. Agencies that accept food or donate food (churches or businesses, shelters etc.) are already inspected and regulated by the County Health. They also have health inspectors. The County provide mental health and homeless shelters, food to needy schools or WICK - programs where food maybe donated, too.	A change to the regulatory text was not necessary because the commenter did not make any recommendations to revise the regulatory text, and Section 18981.2 of the regulations already addresses the concern raised in this comment. Section 18981.2 of the regulations specifies that a jurisdiction may designate a public or private entity, which includes local environmental health departments to fulfill its regulatory responsibilities.
3007	Blanco, E., Fairfield Public Works Department	The County's has a countywide list of food vendors - These businesses and agencies operate in multiple cities, so a countywide list managed by the LEA would give the state all the data it needs. Have the county report the amount (lbs.) to each city annually. Some items we can capture such as school food recycling or food that the food bank collects and distributes, but when handling food for transport - this really should be the County's responsibility.	Section 18981.2 of the regulations already addresses the concern raised in this comment. Section 18981.2 of the regulations specifies that a jurisdiction may designate a public or private entity, which includes county environmental health departments to fulfill its regulatory responsibilities.
3012	Blanco, E., Fairfield Public Works Department	I have a procurement question for clarification. Do you know if Renewable Diesel will be considered alternative fuel (not CNG or LNG) Compress natural Gas or Liquified Natural Gas. Our hauler is required to use CNG or LNG in all their vehicles including their sweepers per contract. I can get their information.	Eligible recovered organic waste products are limited to materials that are derived from recycling feedstock at, or derived from, solid waste facilities. This is necessary to ensure that the use of the product actually helps reduce disposal of organic waste. While renewable sources of energy and gas are of course preferable to fossil sources from a climate perspective, there is not necessarily a link between the material produced and reduction of organic waste that is disposed in landfills. For example fuel derived from corn-based ethanol or diesel may be eligible for federal RIN credits and is derived from organic material (typically corn grown in Iowa), but it lacks a demonstrable link to the organic waste reduction targets the draft regulations are designed to achieve. The comment lacks information for a process to create renewable diesel that is demonstrably linked to reductions in disposal of organic waste in California landfills. Acceptable fuels are fuels derived from renewable gas produced from recycling California, landfill-diverted organic waste.

Comment Number	Received From	Question/Comment	Response(s)
1001	Blanco, Ester, City of Fairfield, Public Works Dep	Will Renewable Diesel be considered an alternative fuel (not CNG or LNG) Compress natural Gas or Liquified Natural Gas? Our hauler is required to use CNG or LNG in all their vehicles including their sweepers per contract.	Eligible recovered organic waste products are limited to materials that are derived from recycling feedstock at, or derived from, solid waste facilities. This is necessary to ensure that the use of the product actually helps reduce disposal of organic waste. While renewable sources of energy and gas are of course preferable to fossil sources from a climate perspective, there is not necessarily a link between the material produced and reduction of organic waste that is disposed in landfills. For example fuel derived from corn-based ethanol or diesel may be eligible for federal RIN credits and is derived from organic material (typically corn grown in Iowa), but it lacks a demonstrable link to the organic waste reduction targets the draft regulations are designed to achieve. The comment lacks information for a process to create renewable diesel that is demonstrably linked to reductions in disposal of organic waste in California landfills. Acceptable fuels are fuels derived from renewable gas produced from recycling California, landfill-diverted organic waste.
3000	Boone, A., Center for Recycling Research	<p>The High Honor Given to High Diversion Organic Waste Processing [HDOWP] Facilities in the draft regs. The core of this issue is the role of the individual in making waste reduction and recycling happen; CEQA at PRC. 21000 (e) says that “Every Citizen has a responsibility to contribute to the preservation of and enhancement of the environment.” AB 939 relied on local governments and state policy to reduce wasting in California but, as is well known, there was as much garbage in 2015 as in 1988; the limited results of AB 939 called for, in the enactment of SB 1383, the first banning of large volumes of a non-hazardous material (named organics) from landfills.</p> <p>Organic Waste Processing facilities do not rely on “every citizen” to make less garbage; they rely on what is called “centralized separation” (as distinct from “source separation”) to get the materials involved separated out from the mass into marketable commodities. While the waste reduction and recycling industry has accomplished a lot by separating aoeer colletions what we speak of today as “dry recyclables”, the industry has been considerably less successful in developing systems to separate wet organics from other materials. In the light of today’s science and technology, to rely heavily of HDOWP filities is an error; the recent experience in Europe where the European Union has turned its back on centralized separation and abandoned the course of action that California is now planning to embark upon would be an error.</p> <p>I suggest planners consult with numerous people with recent European experiences to see how the EU’s decision in September, 2017 would impact the CA plans indicated here.</p>	A change to the regulatory text is not necessary. The comment expresses disagreement with the allowance of high-diversion organic waste processing facilities but is not suggesting a particular change in regulatory language.
3001	Boone, A., Center for Recycling Research	Fugitive Methane Emissions [FME]: CARB is well aware of the FMEs from oil and gas exploration and recovery but has very lidle information on FMEs at landfills (CARB-RS, p. 73) and even less on FMEs at AD facilities. We know now that landfills leak a substantial amount of the CH4 made in their innards (best summary known to Boone is Sally Brown’s, “Pusng the Landfill Energy Myth to Rest,” BIOCYCLE, May, 2010, the last 4 pages). It should be possible to perform a mass balance equation of methanogenic materials being processed in an enclosed container that would calculate the C atoms going in and the C atoms coming out; it could be presumed	Comment noted. The comment is addressing methane capture, which is beyond the scope of CalRecycle's regulatory authority.

Comment Number	Received From	Question/Comment	Response(s)
		<p>that the difference is “process loss” but, to Boone’s knowledge, no such calculations have ever been made. This is important because if the process loss is greater than “x” (whatever that might be), the world would do a better job by not making methane in the first place. AD is not the only method to convert unwanted and discarded organics into a useful soil amendment; aerobic digestion creates a similar product (without, admittedly, the energy side-benefits), but, if a significant portion of the methane made in this facility escapes into the atmosphere, it is not a net gain. There should be calculations.</p> <p>This message is compounded by the current waste industry’s unwillingness to speak cautiously or detrimentally of landfill methane capture; at the SWANA meeting in Baltimore in Fall, 2017, (Boone was present), you would never know that methane capture at landfills was anything other than 100%.</p>	
3002	Boone, A., Center for Recycling Research	<p>Another shortcoming of the draft regulations is the constant referral to organics as “wastes.” The term solid waste was invented in the 1960s and replaced the term “refuse” (a noun) which had replaced the earlier awkward trilogy of “garbage, trash, rubbish.” By referring to source-separated organics stored in appropriate containers and taken off site for a beneficial use as a “waste” violates the definition of recycling first clarified in the July 20, 1989 print of AB 939 where it referred to recycling as “something one does with materials that would otherwise become solid wastes.” Following this language, a properly managed discarded material is not a waste until the material is misused or not brought to an end-use that maintains the material “in the stream of commerce” (another phrase in PRC s. 41180). The reason this is important can be seen in Oakland’s recent experience with the franchising of waste collection. (This needs further fact-gathering.)</p>	Comment noted. Commenter disagrees with the use of the word "waste" as applied to organics. However, the use of the term "waste" throughout these regulations is consistent with court interpretations of "solid waste."
3003	Boone, A., Center for Recycling Research	<p>At section eight [VIII], subsection A3, entitled “Methane Emission Reductions from Diversion of Landfill Organic Waste” (SLCP-RS, pp. 125-128), CARB does not mention soiled papers as a major feedstock within the organics category, does not explore the costs and difficulties of converting methane from AD facilities into “pipeline” quality natural gas, (so-called “biogas upgrading costs” p. 126, line 7), but most damagingly, omits calculating the income to aerobically-based composting operations from the sale of finished product from the grand scheme of determining what is cost effective. The effect of this omission is to make AD and WWTP preferred alternatives as destinations for the soon-to-be-diverted organics; AD and WWTP are likely to be more costly and in public hands than the broad network of aerobic composting facilities that exist throughout northern California and are universally in private hands.</p>	Comment noted. The comment addresses CARB’s SLCP strategy and is not directed at the regulatory language of this rulemaking.
3004	Boone, A., Center for Recycling Research	<p>The future of CH<sub>4</sub>/methane as a vehicle fuel should be much more cloudy than it is presented here. In the last six months the state legislature has put a billion dollars on the table to convert all public transit in California into electric-motor-based equipment. What makes methane look good is its comparison to the dirtiest of vehicle fuels, diesel, but diesel, even so-called clean-burning diesel, is dying a rapid death in the march to more extensive emission controls. If electric motors for</p>	Comment noted. Commenter is expressing an opinion regarding the future use of methane as vehicle fuel and the future of capital investments in anaerobic digestion. Comment does not suggest a particular change in the regulatory text.

Comment Number	Received From	Question/Comment	Response(s)
		vehicles become the new standard, where will that leave dry process AD?; my guess is that, like PG&E and its high exposure to risk with power lines here there and everywhere, capital will not flow to AD but to the safer, less risky, aerobic facilities with lower start-up and maintenance costs and simpler market entry burdens.	
6096	Borden, T., City of Cupertino	If it can be demonstrated that established organics programs like the City of Cupertino's, meet the overall organics diversion goal of SB 1383, they should be granted the flexibility to build on the programs in a manner that works best for their community. This is especially true in regards to inspection and enforcement requirements, which as proposed would require additional staff without increasing the effectiveness of the existing program. Progress in jurisdictions like the City of Cupertino may only be slowed if if we are unnecessarily burdened with the one-size-fitsall requirements of the proposed SB 1383 regulations. Jurisdictions are not all alike. Those that have already made commitments to achieve Zero Waste (90 percent diversion) and have been early adopters of improvements to their programs and facilities should be allowed flexibility to determine how best to ensure compliance with organics waste reduction requirements within their own communities.	CalRecycle determined that a uniform statewide program with consistent standards was necessary to achieve the ambitious diversion targets in statute that were set on a very short timeline.
6097	Borden, T., City of Cupertino	The City of Cupertino requests that CalRecycle add the following new Section to Article 3 allowing a jurisdiction to choose an "Alternative" collection and compliance system: <b>see language provided</b>	Comment noted, CalRecycle amended the draft regulatory text to include a performance-based source separated organic waste collection service provision.
6098	Borden, T., City of Cupertino	Article 13 -- Revise Section 18994.2: <b>see language provided</b>	A change to the regulatory text is not necessary. It is not necessary to change the title of Section 18994.2. Section 18994.2 outlines the reporting requirements for jurisdiction for Articles leading up to Article 17. Article 17 has specific reporting and recordkeeping requirements for a Performance – Based Source Separated Organic Waste Collection Service listed in Section 18998.2 and Section 18998.4. These reporting requirements include some aspects of Article 1-16 and new requirements specific to Article 17.
6099	Borden, T., City of Cupertino	The City of Cupertino requests that CalRecycle add a new Section to Article 13 to simplify the reporting requirements: <b>see language provided</b> A jurisdiction selecting an alternative collection system would demonstrate high diversion of organics in lieu of being subject to the inspection, enforcement and reporting requirements of Articles 14, 15 and 16. High diversion of organics may be demonstrated by the achievement of a significantly reduced per capita disposal, as measured by an equivalent overall jurisdiction diversion rate of 80 percent or higher. Per capita disposal is already measured as part of the annual AB 939 review process. If a jurisdiction fails to achieve a reduction in per capita disposal equivalent to an 80 percent diversion rate in 2025, then that jurisdiction would be required to implement one of the other three collection system options and become subject to all the requirements of Articles, 13, 14, 15, and 16. A similar "two track" compliance system was used by the State Water Resources Control Board in the adoption of its Trash Amendments for the Ocean Plan and the Water Quality Control Plan for Inland Surface Waters. The two track compliance approach offered by the State's Trash Amendments gave jurisdictions the choice of	Comment noted. Please see Article 17 for the Performance – Based Source Separated Organic Waste Collection Service.

Comment Number	Received From	Question/Comment	Response(s)
		installing trash full capture devices on inlets throughout the jurisdiction or implementing a trash load reduction program that achieves the equivalent of the State's requirement.	
6100	Borden, T., City of Cupertino	Article 10, Section 18991.3 Commercial Edible Food Generators - The Proposed Regulation should clarify that food sales at large events and large venues that are NOT a part of the venue's direct concession services should be exempt from the food donation requirements. Examples include food trucks located in/at large venues and events, nonregulated food vendors, and persons serving food outside of the event or venue such as tailgating.	CalRecycle would like to clarify that food vendors operating at large events and large venues are not exempt from the edible food recovery regulations. Large event and large venue operators must make arrangements to ensure that the food vendors operating at their event or venue are recovering the maximum amount of their edible food that would otherwise be disposed. In a situation where the food vendors at a large venue or large event are not in compliance with Section 18991.3 of the regulations, the operator of the large event or large venue would be responsible for compliance.
6101	Borden, T., City of Cupertino	Recovered Organic Waste Product Procurement-Article 12, Section 18993.1 establishes procurement targets for the purchase of organic waste products. We understand the need to create markets for recovered waste products. However the current proposal, which relies heavily on the purchase of renewable transportation fuel, is likely to result in a large investment of vehicles and equipment that can utilize these fuels. As we do everything reasonable to electrify our fleets in order to meet the State's AB 32 goals, any investments required in vehicles and equipment that run on fuels derived from organics are essentially a step backward in our mutual efforts to combat climate change.	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle disagrees that RNG procurement is contrary to state goals for electrification. The use of renewable natural gas as outlined in the 2017 Climate Change Scoping Plan (2017 Scoping Plan) (CARB 2017), which is the official plan for how the state will meet the greenhouse gas emissions</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>requirements pursuant to Assembly Bill 32 (Nuñez, Chapter 488, Statutes of 2006) and SB 32 (Pavley, Chapter 249, Statutes of 2016). The 2017 Scoping Plan lists the organics diversion regulation as a measure that will be utilized to ensure this emissions reduction goal is met, and states that “procurement policies [are] needed to encourage in-vessel digestion projects and increase the production and use of renewable gas (CARB 2017: 68). Further, the regulatory procurement requirements were developed in consultation with the California Air Resources Board and the California Energy Commission. Per the provisions of Section 39730.8 of the Health and Safety Code, the regulatory procurement requirements were designed to be in alignment with the recommendations found in the 2017 Integrated Energy Policy Report (IEPR), which was developed by the California Energy Commission in consultation with the Public Utilities Commission and the California Air Resources Board.</p>
6102	Borden, T., City of Cupertino	<p>Article 14, Section 18995.2(c) - The proposed regulations require a jurisdiction to provide access to its implementation records within one business day. The California Public Records Act indicates an agency must provide the records within a reasonable period of time and allows ten-day period for response. We request the text change from one business day to ten days.</p>	<p>CalRecycle has revised section 18995.2 (c) in response to this comment to allow for 10 business days rather than one.</p>
1173	Bowers, Ken, Tulare County Health and Human Services Agency, Environmental Health Division	<p>Please Remove Section I 8083(c)- It also makes those checks a performance standard of the LEA.</p>	<p>CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.</p>
9210	Bowers, M., Sunnyvale	<p>The procurement requirement appears based on an assumption that the entire 75% diversion is happening right from the beginning. Any formula for procurement should reflect what is actually being diverted in a given year.</p>	<p>The procurement requirements are designed to build markets for recovered organic waste products, which is an essential component of achieving the highly ambitious organic waste diversion targets mandated by SB 1383. CalRecycle developed an open and transparent method to calculate the procurement target that is necessary to help meet the highly ambitious diversion targets set forth by the Legislature. CalRecycle has also revised section 18993.1 to expand the list of eligible recovered organic waste products to provide jurisdictions with even more flexibility to choose product that fit local needs.</p> <p>Regarding the proposal to base the procurement target methodology on "what is actually being diverted in a given year" CalRecycle disagrees. The comment lacks specific language for quantifying such an approach. Even if the commenter recommended a quantifiable way to determine this approach, California has over 400 diverse jurisdictions and it would be overly burdensome to account for each jurisdiction’s specific circumstances and to develop a procurement target and enforcement policy for each one.</p>
9211	Bowers, M., Sunnyvale	<p>Thank you as well for CalRecycle's changes in this most recent version of the regulations, such as allowing gray or black disposal containers and use of lid colors to designate container types. Among other things, the additional flexibility in Title 14 language about movements of remnant organic material is also welcome.</p>	<p>CalRecycle has revised the definitions of the containers to be consistent with each other. Also, thank you for the comment related to the increased flexibility regarding the color and hardware of the containers.</p>

Comment Number	Received From	Question/Comment	Response(s)
9212	Bowers, M., Sunnyvale	<p>We understand and agree with the urgency and importance that CalRecycle and the Air Resources Board attach to the goal of increasing diversion of organics. However, we remain concerned that the very prescriptive and process-oriented approach taken in the proposed regulations does not well support achievement of the organics goal. Making serious inroads with food scraps diversion, in particular, requires literally getting into our residents' kitchens, which gets very personal and is not always well received by residents. In rolling out our organics diversion programs we have found that success requires education, awareness, and informed consent. Prescriptive approaches risk backlash founded in emotions, world views, and other uncontrollable human factors. The punitive, enforcement-based approach to residents and businesses will make it harder for some of our customers to contemplate making the behavior changes needed to reach the very ambitious goals set by SB 1383.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
9213	Bowers, M., Sunnyvale	<p>41) "Non-compostable paper" – Plastic coatings are mentioned among reasons why a paper item would not break down in the composting process. The definition would be more complete and informative if other reasons were added. For example, waxed and "wet strength" papers are also designed in various ways to not break down when placed in cold storage and are other common types of non-compostable paper.</p>	<p>It is not necessary to define the term "breakdown." The term is only used once in the regulation in the definition of non-compostable paper. "non-compostable paper includes, but is not limited, to paper that is coated in a plastic material that will not breakdown in the composting process." It is clear from how the term is used that "breakdown" means to fully breakdown from the original material into compost. There is no degree or "extent" of breakdown to define. If a material does not breakdown into compost during the composting process it is non-compostable. Non-compostable paper should not be collected for composting and put into the composting process. However; the regulation is not limited to requiring the recovery of "compostable" organic waste composting is not the only method of recovery, and just because a material is not "readily compostable" does not mean that it is not organic waste, and not a part of the material the state must reduce from disposal and include in the regulations. There are other means of recovering organic waste. Non-compostable paper may be more suited for collection and recovery with other paper material for recovery, rather than food waste and green waste.</p>
9214	Bowers, M., Sunnyvale	<p>(46) "Organic waste" – The detail in the definition of organic waste varies from definitions of "organics and "organic waste" used in related statutes and regulations. For example:  SB 1383 - (46) "Organic waste" means solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges.</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>AB 1826 - (c) "Organic waste" means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.</p> <p>AB 901 - (39) "Organics" means material originated from living organisms and their metabolic waste products. This includes, but is not limited to, food, "agricultural material" as defined in section 17852(a)(5) of this subdivision, "agricultural by-product material" as defined in section 17852(a)(4.5) of this subdivision, green material, landscape and pruning waste, nonhazardous lumber and dimensional wood, manure, compostable paper, digestate, biosolids, and biogenic sludges; and any product manufactured or refined from these materials, including compost, and wood chips.</p> <p>It is operationally important to have consistently applied terms, especially a term as important and commonly used as "organic waste". The proposed regulations advance a definition that is both impractical and inconsistent with existing definitions of the same term. We do not believe the definition should include items like organic textiles and carpets, biosolids, digestate, and sludges. Carpet, for example, can be made of many different materials and the general public is not going to accurately differentiate between various types of carpet for purposes of compliance with these rules.</p>	<p>requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>
9215	Bowers, M., Sunnyvale	<p>(66) The purpose of creating this definition of "Self-hauler" is unclear, particularly considering how the term is used in Article 13 (see the Article 13 comment that follows). As defined, "Self-hauler" is so broad that could describe nearly every resident, business, government facility or other entity in California. For example, it would include a person who transported their own empty beverage containers by foot, bicycle or auto to a CRV redemption center.</p>	<p>The purpose of the definition of "self-hauler" is to define a term used in the regulations. By necessity, this definition needs to be broad and flexible.</p>
9216	Bowers, M., Sunnyvale	<p>66)(A) The "Back-haul" definition describes waste transportation actions that, under some circumstances, violate laws, ordinances, etc. We ask that the phrase "in conformance with applicable local and state laws and permit requirements" be added to the end of the definition.</p>	<p>The "back-haul" definition is intended simply to clarify a portion of the definition of "self hauler" and the definition itself is not the appropriate mechanism to place specific requirements on how self-hauling or back-hauling is conducted. Furthermore, Public Resources Code Section 40059(a)(1) specifically places aspects of solid waste handling which are of local concern, such as means of collection and transportation, within the local control of counties, cities, districts, or other local governmental agencies. In addition, SB 1383 (in Public Resources Code Section 42654) specifically states that nothing in these regulations abrogates or limits the authority of local jurisdictions to enforce local waste transportation requirements. Commenters asked CalRecycle to consider whether the definition of self-hauler is needed since it is so broad. If it is needed, the definition needs to be revised and it needs to be clarified on how the Department will be getting information from jurisdictions about the self-haulers.</p> <p>Section 18994.2(f)(4) regarding reporting on the number of self-haulers by the jurisdiction was deleted. However, the definition in Section 18982(a)(66) is still needed.</p>
9217	Bowers, M., Sunnyvale	<p>77) "Yellow container" – Sunnyvale uses yellow cart lids for the food scraps side of our FoodCycle garbage/food split carts. A neighboring jurisdiction uses the same cart, but with a brown lid for the food compartment. After observing the carts in use, we find that brown is the better color—it "shows" dirt less and cart</p>	<p>CalRecycle responded to stakeholders who initial had issues with the container color being yellow because yellow containers will quickly become discolored and unattractive if used for the collection of food waste; and yellow coloration does not hold up well in UV conditions. Therefore, brown was chosen because brown coloration shows dirt less; and cart manufacturers can use</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>manufacturers tell us that they can use higher percentages of recycled plastic to make brown, vs. yellow lids. So, in the interest of clean appearance and plastics recycling market development, we ask that this definition be changed to require brown (or allow the use of either brown or yellow).</p>	<p>higher percentages of recycled plastic to make brown versus yellow containers and lids, leading to more market demand for recycled plastic. The jurisdiction would be able to continue to use the brown containers for manure until they reach the end of their useful life or until 2036, whichever comes first.</p>
9218	Bowers, M., Sunnyvale	<p>In Section 18983.2(a)(3), approval of a proposed process or technology depends entirely on a pass/fail conclusion that the process or technology results in GHG emissions reductions equal to or greater than 0.30 MTCO<sub>2e</sub> per ton, which is described as the GHG reduction achieved by composting mixed organic waste. The ISOR goes into great detail in describing a basis for the 0.30 MTCO<sub>2e</sub> benchmark. Assuming for the sake of argument that the ISOR calculations are correct, they set this benchmark based on an average for mixed organic waste. But material-specific values for compostability and potential to emit carbon vary considerably from the average. Thus, the methodology may block the use of valuable technologies that target the “below average” items that do not compost well. For example, a technology that targeted diversion of source-separated organic carpet or lumber, items which release little carbon to the atmosphere but which we still want to divert from disposal, could easily fail to pass the 0.30 MTCO<sub>2e</sub> hurdle. The rigid 0.30 MTCO<sub>2e</sub> standard could prove to disqualify otherwise valuable diversion methods and hamper the achievement of the diversion goals stated in SB 1383. We ask that this section be revised to provide the CalRecycle Director more flexibility for approval of proposed processes and technologies.</p>	<p>Several commenters suggested providing more flexibility to consider new technologies that target diversion of source-separated organic materials that do not compost well such as carpet or lumber, and that have a lower methane emissions reduction potential than mixed organic waste decaying in a landfill. The point of utilizing the greenhouse gas reductions associated with composting as a threshold was not to incentive composting, but rather to set a reasonable threshold for ensuring that the regulation incentivizes the greenhouse gas emissions reductions required to meet the methane reduction target required by SB 1383 and the organics diversion targets specified in the Short-Lived Climate Pollutant Reduction Strategy. The benchmark value of 0.30 MTCO<sub>2e</sub> per short ton organic waste was set to ensure emission reductions for any new technology are comparable to the emission reductions necessary to achieve the strategy’s emission reduction goal of 4 MMTCO<sub>2e</sub> for this sector.</p>
9219	Bowers, M., Sunnyvale	<p>While we recognize and appreciate CalRecycle’s efforts to provide for a variety of collection strategies, the “three-container/two-container/single-container” options are very prescriptive, contain detailed, inflexible requirements, fail to consider unavoidable variations in how organics are collected, processed and marketed, and are tied to the problematic reporting and enforcement regime detailed in Articles 13, 14, 15 and 16. To maximize the suitability for recycling of the materials we collect, Sunnyvale uses a “five-container” system that provides residents a yard trimmings cart, a dual stream recycling cart (split between paper and containers), and a dual-stream garbage cart (split between food scraps and garbage). While we think this highly effective system complies with Section 18984.1, the extremely prescriptive wording of the section leaves some uncertainty. CalRecycle may feel it needs to take this detailed approach with jurisdictions that are resistant to increasing their organics diversion. However, many jurisdictions, including Sunnyvale, are already pursuing Zero Waste goals in ways that also promote 70% and 75% organics diversion. Thus, we support the creation of an “Alternative 4” that allows cities and counties to opt out of the prescriptive measures in Article 3, the enforcement requirements of Articles 14, 15 and 16 and reporting requirements in Article 13 that pertain to Articles 14, 15 and 16. In summary, Alternative 4 would allow a jurisdiction the option of demonstrating that it is meeting or exceeding the 70% and 75% statewide diversion goals. This would relieve the State of burdensome oversight of high performing jurisdictions</p>	<p>The regulations allow for this type of variation in the collection system. Additionally, CalRecycle amended the draft regulatory text to include a performance-based source separated organic waste collection service provision.</p>

Comment Number	Received From	Question/Comment	Response(s)
		and allow those jurisdictions to focus their efforts on diversion, not checklists, citations and fines. If a jurisdiction failed to demonstrate compliance through the alternative method by 2025, it would be required to implement one of the other three collection system options and become subject to all the requirements of the regulations. Suggested language is as follows:	
9220	Bowers, M., Sunnyvale	<p>We ask that a new section be added to Article 3, as follows:  Section 18984.13. Alternative Collection and Compliance System  (a) A jurisdiction may implement an alternative collection system that consists of any one of or any combination of those allowed under Sections 18984.1, 18984.2 and 18984.3. The alternative system may, but is not required to, incorporate the provisions required by Sections 18984.5 and 18984.6, and will furthermore be in full compliance with the requirements of Articles 14, 15 and 16 if all these conditions are met:</p> <p>(1) A jurisdiction that chooses to implement an alternative collection system must:</p> <ol style="list-style-type: none"> <li>i. Have a Zero Waste Plan or Zero Waste Policy that was adopted prior to January 1, 2019;</li> <li>ii. Have an organics diversion program for both single family residential and commercial customers that was established prior to January 1, 2019;</li> <li>iii. Demonstrate a continued reduction in the amount of organics being disposed in landfill through one of the following measures: <ol style="list-style-type: none"> <li>1. A forty percent reduction in the overall population pounds per day disposal rate in 2025 as compared to 2017, demonstrated by the annual AB 939 report submitted on August 1, 2026.</li> <li>2. No more than 25 percent of the total organic wastes generated in the jurisdiction is disposed in landfill.</li> </ol> </li> </ol> <p>(2) A jurisdiction that has not demonstrated a continued reduction in the amount of organics being disposed in landfill for the calendar year 2025 using one of the methods allowed in (iii) above will no longer be approved to implement the alternative system and must be in full compliance with all the provisions of Sections 18984.5, 18984.6 and Articles 14, 15 and 16 no later than January 1, 2027.</p>	CalRecycle amended the draft regulatory text to include a performance-based source separated organic waste collection service provision.
9221	Bowers, M., Sunnyvale	<p>CalRecycle would need to document an accepted process by which the amount of disposed organic wastes could be determined. Our suggestion:  A community may determine their total organic waste generation rate based on either:</p> <ol style="list-style-type: none"> <li>1. The statewide per capita organic waste generation rate as determined by CalRecycle, or</li> <li>2. A statistically valid waste composition study that would include the determination of all organic wastes currently being diverted, and all organic</li> </ol>	CalRecycle has revised Section 18992.1(a)(1)(B)(1) in response to these comments. The change is to allow a local waste characterization study to be used even if it pre-dates CalRecycle's statewide waste characterization study, as long as it is conducted within five years of the next capacity planning cycle. The change is necessary for at least two reasons: 1) CalRecycle may not be able to conduct studies on a concurring and timely basis; and 2) a local study may be relevant for an extended period of time if local demographics, etc., do not change significantly.

Comment Number	Received From	Question/Comment	Response(s)
		<p>waste still being landfilled, and not to identify organics disposed as a percentage of the total waste being landfilled.</p> <p>The waste generation study (or the statewide per capita generation rate) would provide the base per capita organic waste generation rate against which compliance would be measured. If a full waste generation study was chosen it would identify all organic wastes generated, including organic wastes prevented by actions of the jurisdiction, all organic wastes diverted within the jurisdiction, and all organic wastes still being landfilled. This would include sampling to determine the amount of organic waste generated in the residential sector and separately in the commercial sector (including compactors but not C&amp;D materials). These amounts would be combined to calculate a per capita organic waste generation rate, which would be used to calculate the overall per capita waste generation rate for future years.</p>	
9222	Bowers, M., Sunnyvale	<p>Section 18990.1(b)(2) states that a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition or initiative that includes provisions that..." Limit a particular solid waste facility, operation, property, or activity from accepting organic waste imported from outside of the jurisdiction for processing or recovery."</p> <p>Section 18990.1(c) then lists five specific exceptions to the statement in the preceding paragraph. Missing from the list of exceptions is a situation where, as in Sunnyvale, a jurisdiction is a market participant that owns and operates its own facility and may choose to contract directly with other jurisdictions to also provide services to them. We do not believe the regulations intend to say that our MRF/transfer station must accept organic waste from any entity that shows up at the gate without that entity having made contractual arrangements and/or agreeing to pay the required charges.</p> <p>Thus, we ask that you add a Section 18990.1(c)(6) stating words to the effect of, "[does not] Require a publicly-owned solid waste facility or operation to accept organic waste from outside the facility's service area boundary or from a jurisdiction, generator or hauler that does not have a contractual or business relationship that provides for disposal of organic waste at the facility."</p>	A text change is not necessary because Section 18990.1(c)(4) does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery.
9223	Bowers, M., Sunnyvale	<p>The concept of requiring cities, counties and special districts to purchase compost and/or "renewable transportation fuel" derived from "California, landfill-diverted recycled organic waste" is a concept not found in the statute. The amount the City is required to purchase assumes that local government accounts for 13% of gross domestic product (GDP) and that local government can and must use 13% of all diverted organics. The calculations are also optimistically based, starting Day One, on the tonnage diverted in 2025 if the 75% diversion level is achieved.</p> <p>The assumptions and specifics of Article 12 are problematic in several ways.</p> <ul style="list-style-type: none"> <li>o State agencies, schools and other entities have no corresponding purchase requirements and penalties. This inconsistency appears arbitrary. Why are</li> </ul>	<p>SB 1383 provides a broad grant of regulatory authority to the Department that would include procurement requirements that CalRecycle has determined are necessary to achieve the organic waste diversion goals in statute by ensuring an end use for processed organic waste. Public Resources Code Section 42652.5 states that, "The department, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code." That section also provides that the Department may "include different levels of requirements for local jurisdictions..."</p> <p>Furthermore, the Department also maintains broad, general rulemaking authority in Public Resources Code Section 40502, "The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>state agencies, etc. not required to take similar procurement actions as jurisdictions?</p> <ul style="list-style-type: none"> <li>o The per capita quantities appear to overstate what is practical and achievable. When we calculate the Sunnyvale purchase quantities, the City must purchase more than 6,200 tons per year of compost. The City currently purchases and distributes free to its residents on 362 days per year, unlimited amounts of compost. Annual demand for this material is just 500 tons. If we assume that City workers and contractors consume a similar amount, bringing the annual total to 1000 tons, that still only brings City consumption to 16% of the required amount.</li> <li>o The City may attempt to comply with purchases of, “renewable transportation fuel,” (very narrowly defined as fuel derived from renewable gas from organic waste that has been diverted from a landfill and processed at an in-vessel digestion facility...” To do so would require (assuming a fleet average of 20 mpg) buying enough fuel to drive over four million miles annually. The fact that consumption of such huge amounts is required for compliance calls into question the assumptions and methodology used to calculate the per capita requirement.</li> <li>o Limiting solid end products to “compost” fails to recognize the many other uses made of diverted organics, especially mulch and similar products.</li> <li>o Limiting biofuel to transportation uses fails to give credit to other legitimate uses of renewable methane gas made from landfill-diverted organics, such as pipeline injection and generation of electricity (the latter being the outcome for a portion of the material collected by the City’s food scraps collection program).</li> <li>o Limiting the feedstock for the purchased materials to California sources may conflict with the Commerce Clause of the United States Constitution. Federal courts have consistently frowned on states acting to restrict sources and destinations of trade based on state boundaries.</li> </ul> <p>We ask that CalRecycle replace the Article 12 mandate with a simple requirement that all government entities in California, including state agencies, schools, etc. specify recycled material when purchasing compost, mulch and similar products. If a procurement requirement is retained, we ask that it:</p> <ul style="list-style-type: none"> <li>• Allow biogas uses other than transportation fuel to qualify</li> <li>• Allow mulch and similar waste-derived materials to qualify</li> <li>• Use calculation factors that result in required amounts bearing some resemblance to what a jurisdiction is capable of consuming.</li> <li>• Use calculation factors that adjust annually in accordance with how much organics is actually being diverted during that year.</li> </ul>	<p>(commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where the Department successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream. Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p> <p>Although the proposed regulations limit procurement of recovered organic waste products to certain enumerated products made from California, landfill-diverted recycled organic waste,</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>relevant U.S. Supreme Court cases regarding the dormant Commerce Clause allow for regulation that discriminates against interstate trade if it serves a legitimate local purpose that cannot be served as well by available nondiscriminatory means. <i>Maine v. Taylor</i>, 477 U.S. 131 (1986); <i>Hughes v. Oklahoma</i>, 441 U.S. 322, 99 S. Ct. 1727 (1979).</p> <p>Here, the legitimate local purpose is to achieve the organic waste diversion goals enumerated by the Legislature in SB 1383. An essential component of achieving such goals is to ensure markets for organic material diverted from landfills within California to prevent that material from being disposed due to lack of end uses. End-use markets must be limited to products actually generated from in-state, diverted organic waste to be consistent with the statutory goals of SB 1383. An alternative, non-discriminatory requirement that allows procurement of out-of-state compost, RNG transportation fuel or other such products would have no effect on preventing the disposal of organic waste in California and would therefore have no nexus to achieving the goals laid out in SB 1383.</p> <p>CalRecycle amended the proposed regulations to expand the list of recovered organic waste products to include mulch and renewable gas for electricity and heating applications. In addition, Section 18993.1(h) of the proposed regulations is included to provide a “safety valve” to address any cases where procurement targets exceed local need in order to relieve jurisdictions of purchasing excess or unnecessary recycled organic waste products.</p>
9224	Bowers, M., Sunnyvale	<p>With reference to our previous comment on the definition of “Self-hauler,” the purpose of this requirement to annually report, “The number of self-haulers approved to operate within the jurisdiction” is unclear. As defined, all waste generators in Sunnyvale are approved self-haulers.</p> <p>We ask that you review the self-hauler definition and all requirements related to self-haulers and amend the regulations to clearly state what information is to be reported, and why.</p>	<p>CalRecycle has revised Section 18988.3 in response to this comment. The change omits the requirement for a self-hauler to annually report the amount and location/address of source separated organic waste in tons that was self-hauled in the jurisdiction. In respect to Section 18994.1, the reporting requirement for the tons of organic waste that were disposed as a result of waivers identified in Subsection (1), the data collected in regard to AB 901 in the Recycling and Disposal Reporting System (RDRS) does not track the amount of organic waste disposed. If it is considered solid waste, the regulations do not require solid waste disposed to be divided between “trash” and “green material,” so obtaining this information from RDRS is not possible.</p>
9225	Bowers, M., Sunnyvale	<p>This item asks jurisdictions to report, “the volume of each recovered organic waste product procured...”</p> <p>Elsewhere in the regulations, solid materials are measured by mass (tons, pounds, etc.). Is volume used here purposefully, or should “weight” or “mass” be substituted?</p>	<p>The word “volume” has been replaced with “amount”. Recovered organic waste products are measured in different units. For example, compost is measured in tons or cubic yards, while renewable transportation fuel is measured in diesel gallon equivalents (DGE).</p>
9226	Bowers, M., Sunnyvale	<p>The requirement to provide access to records within one business day is unreasonable. There are a host of legitimate reasons that may prevent this standard from being met, including employee workload and absences due to vacation and illness. We ask that this requirement be revised to be consistent with the Public Records Act, which provides 10 days, consistent with this document’s reference to the PRA in 18995.2(g).</p>	<p>CalRecycle has revised section 18995.2 (c) in response to this comment to allow for 10 business days rather than one.</p>
9227	Bowers, M., Sunnyvale	<p>The proposed regulations appear in this section to exceed the statutory authority granted by the SB 1383 statute. Most notably, the statute says, in Section 42652.5(a)(1), “The regulations...may authorize local jurisdictions to impose penalties on generators for noncompliance.” But Section 18995.4(a)(1) –</p>	<p>The enforcement process in the regulations is only triggered upon a Notice of Violation (NOV) and a jurisdiction would have discretion whether or not to issue an NOV.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>Enforcement by a Jurisdiction – says, “The jurisdiction shall issue a Notice of Violation to any entity found in violation...”</p> <p>If the regulations continue to take their current, very detailed and prescriptive approach, we ask that Article 14 be revised to conform to the statutory language, i.e. that jurisdictions may (not shall) take enforcement action.</p>	
9228	Bowers, M., Sunnyvale	<p>We count 43 separate, process-oriented actions, reports, etc. required of a jurisdiction, for each of which CalRecycle may cite and fine the jurisdiction. Few, if any of these citable offenses directly relate to the goal of SB 1383, which is to reduce carbon emissions from end-of-life handling of organics.</p> <p>We separately count 25 separate items for which the City must (not “may,” but “shall”) cite and fine its customers—the residents and businesses who pay the bills for our diversion programs and to whom we provide recycling and solid waste services. There are seven similar items that call for citations and fines for our hauler and other contracted service providers.</p> <p>As we learned from our rollout in 2017 of residential food scraps diversion programs, the types of behavior changes required to implement effective organics programs provokes strong emotional reactions from some members of the community. Residents will react to citations and fines in negative ways that will make it more difficult for us to get across the message that organics diversion is a beneficial behavior and the “new normal.” Considerably more state-wide public understanding of the issues driving the need for higher levels of organics recycling is needed. Coercive, punitive approaches will not gain the public trust and cooperation needed to realize the goals set in SB 1383. We ask that you back up, then substantially revise the regulations to take a more collaborative and less punitive approach in this area.</p>	<p>CalRecycle has revised the penalty amounts in Section 18997.2 from per day violations to per violation. The penalty provisions are consistent with the existing penalty limitations in the Government Code Sections 53069.4, 25132 and 36900. Entities in violation are given ample time through the Notice of Violation process to comply and avoid penalties.</p> <p>A change to the regulatory text is not necessary. The penalty fines listed in Section 18997.2 Base Table 1 are the minimum penalty thresholds imposed by a jurisdiction. The severity levels allow a jurisdiction the discretion to penalize smaller businesses at the minimum penalty and levy a more substantial penalty against larger businesses that may be contributing more to the organic waste stream. These penalties are consistent with the limitations on fine levels for local agencies in the Government Code. The penalty fines listed in section 18997.3 Base Table 1-10 are minimum penalty threshold to be imposed by the Department and are specifically contemplated in the language of SB 1383 as being up to \$10,000 per day. These penalties are reserved for the jurisdictions and for entities when the jurisdiction has failed to enforce. In most programs with a progressive enforcement process, generators or operators have ample time to comply, resulting in very few fines. For example, Section 18995.4 explains the minimum timeframe for the process of issuing a Notice of Violation to an entity if they are found non-compliant. A jurisdiction has 60 days from the date of inspection to issue a NOV. This allows time for the entity to remedy the situation before the jurisdiction has to issue a NOV. If an NOV is issued, the entity has up to 150 days to come into compliance before the jurisdiction must commence action to impose a penalty. This allows an entity up to 210 days to remedy a violation before a penalty is imposed. Additional extensions are available due to extenuating circumstances or infrastructure deficiencies.</p> <p>CalRecycle has revised the penalty amounts in Section 18997.2 from per day violations to per violation. The penalty provisions are consistent with the existing penalty limitations in the Government Code Sections 53069.4, 25132 and 36900. Entities in violation are given ample time through the Notice of Violation process to comply and avoid penalties. Jurisdictions have the discretion to develop their own factors to be considered when determining a penalty amount, such as but not limited to, the impact on a disadvantaged community or the ability to pay, similar to the factors used by the Department listed in section 18997.3(d).</p>
9229	Bowers, M., Sunnyvale	<p>Thank you for making changes to this definition of Regional Organic Distribution Center, upon which we commented during the informal process. However, the new language is unclear on exactly what materials stores may send back to a distribution center.</p> <p>The term “produce” in the definition is lined out and replaced with “organic,” so it reads, “‘Regional Organic Distribution Center’ means a distribution center that receives unsold and packaged food produce (sometimes referred to as “pre-consumer” back from stores to which it was originally sent and which remains the</p>	<p>Package food produce would include any produce that requires de-packaging.</p> <p>CalRecycle has revised the definition of “Regional Organic Distribution Center” in response to comments. The change clarifies that these activities would be allowed to receive unsold food produce, including packaged food produce which should encourage high recovery rates. Since the proposed regulations require a regional produce organic distribution center to transfer the waste it handles to a beneficial use or for further processing, more unsold package and unpackage produce from stores should be diverted from disposal.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>property of the distribution center or stores, for the purpose of data collection, depackaging, and transferring this produce and other food to a compostable material handling operation or facility, in-vessel digestion operation or facility, or to another beneficial use” [sic].</p> <p>What does “packaged food produce” mean in this context? Does this definition limit such facilities to handling only packaged food?</p> <p>If these facilities are allowed to handle produce, we must repeat our concerns, which are based on knowledge of the material outputs of at least one very large regional grocery distribution center. This facility receives, via backhaul in food delivery trucks, rotten and unmarketable produce from stores, among other things. Our observations of materials delivered from this grocery distribution facility to a third-party compost facility revealed little diversion of recyclable material prior to delivery of “organics” to the compost facility. The loads of “organics” we saw and were told about contained large amounts of rigid plastic trays, recyclable corrugated cardboard, boxes of glass bottles full of wine and liquor, and significant amounts of other materials that (1) do not meet the specifications of the compost facility operator and will contaminate the finished product, (2) will be disposed at a landfill by the compost facility operator and (3) could have easily been recycled at the stores, using services provided by the City. We believe that this industry sector requires more, not less, regulation so far as its handling of recyclables and organics.</p>	<p>These activities, while handling materials that might be considered putrescible wastes, do not engage in the types of waste handling activities that are intended to be regulated by the solid waste transfer/processing permitting provisions. The restriction that the food produce be sent back to the original distribution center that sent it and the purpose for returning the food produce to the distribution center should minimize public health, safety, and environmental issues at the distribution centers. Nothing precludes the enforcement agency from inspecting an activity to verify that the activity is being conducted in a manner that complies with the applicable definition.</p> <p>Comment noted. CalRecycle is not proposing to revise the regulatory permitting tier structure. This is not within the scope of this rulemaking.</p>
9230	Bowers, M., Sunnyvale	<p>See the immediately preceding comment. The proposed change to Table 1 appears to exempt “Regional Organic Distribution Centers” from Title 14 regulation. Based on the inputs and outputs of the distribution center we are familiar with, it appears to function as a solid waste transfer station and should be permitted and regulated as such and subjected to LEA oversight, NOT exempted from regulations.</p> <p>Sections: 17409.5.2 (Measuring Organic Waste Recovered from Mixed Waste Organic Collection Stream)  17409.5.3 (Measuring Organic Waste in Residuals Removed from Mixed Waste Organic Collection Stream)  17409.5.4 (Measuring Organic Waste Recovered from Source Separated Organic Waste Collection Stream)  17409.5.5 (Measuring Organic Waste in Residuals Removed from Source Separated Organic Waste Collection Stream)  17409.5.8 (Incompatible Materials Limit in Recovered Organic Waste)  17867(a)(16)(B) (Composting Operation and Facility Siting and Design Standards)  17896.25.1(a)(1) (In-Vessel Digestion Operations and Facilities Regulatory Requirements)  17896.44.1 (Measuring Organic Waste in Residuals)</p> <p>Each of these sections proposes to require operators of facilities that process organics to capture, at least daily, very large (one cubic yard) samples from various process streams and perform detailed waste characterization sorts to document levels of organics and contaminants. These requirements are:</p>	<p>Regarding changing the permitting tier for the Regional Organic Distribution Centers: Comment noted. CalRecycle is not proposing to revise the regulatory permitting tier structure. This is not within the scope of this rulemaking</p> <p>In addition, nothing precludes the enforcement agency from inspecting an activity to verify that the activity is being conducted in a manner that complies with the applicable definition.</p> <p>In regards to the methodology:  CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample be a random and representative of a typical operating day for 10 consecutive days per reporting period, instead of daily sampling one cubic yard.</p> <p>The sampling frequency 10 consecutive days was based on that 2 consecutive weeks per quarter, yielding 10 samples per quarter and 40 samples per year. This is consistent with ASTM calculation method (Standard Test Method for Determination of the Composition of Unprocessed Municipal Solid Waste; ASTM International; Designation: D-5231-92 (Reapproved 2003)) for estimating the number of samples required to achieve a pre-determined precision of specific material type. Using data from the “2014 Disposal-Facility- Based Characterization of Solid Waste in California”,</p>

Comment Number	Received From	Question/Comment	Response(s)
		<ul style="list-style-type: none"> <li>not based on statistical science</li> <li>will generate no more useful data than could be obtained by combining scale data for inbound and outbound shipments with less costly and intrusive sampling methods</li> <li>will consume vast amounts of time, labor, money and physical space that will be far in excess of the value of the information gained.</li> </ul> <p>Equivalent performance tracking information can be obtained with sampling events conducted quarterly that use multiple small samples and thus improve the validity of the data.</p> <p>The “Alternatives to Measurement Protocols” provisions in 17409.5.9 are appreciated, but require approval by the LEA and concurrence by CalRecycle, neither of which a facility operator can count on obtaining. That leaves the unacceptable methods in the five sections listed above as the benchmark for compliance.</p> <p>We ask that CalRecycle engage experts in scientific sampling and statistics to recast Article 6.2, sections 17409.5.1 through 17409.5.5 so that valid information can be obtained in a more reasonable manner. Sunnyvale uses such sampling in its management of the Sunnyvale Materials Recovery and Transfer Station (SMaRT Station). The City and its municipal partners have long been keenly interested in the composition of SMaRT Station material streams because we use the information to determine each city’s share of millions of dollars of recycling revenue. Attachment 2 and Attachment 3 to this comment letter are copies of the detailed protocols our facility operator is required to use when determining the compositions of various process streams. The protocols display the complexity and amount of work required to do scientifically valid sampling correctly and well make the point that these four sections will be unworkable if they remain in the adopted regulations.</p> <p>17409.5.11(b)(1) (Remnant Organic Material in the Gray Container Collection Stream)</p> <p>17867(4)(A) (General Operating Standards)</p> <p>Title 27, 20901(a)(1) (CalRecycle—Loadchecking Contamination in Source Separated Organic Waste)</p> <p>These sections state, “One loadcheck shall be conducted for every 500 tons of [gray container/source separated organic] waste received per operating day. If the operator receives less than 500 tons for the operating day, a minimum of two (2) loadchecks shall be performed for that operating day.”</p> <p>Is the word “less” in the second sentence (in bold text above) instead meant to be “more”? As written, the requirement seems to require a minimum of two loadchecks per day, regardless of how little waste is received at the facility. For example, a 25-ton per day facility would still need to perform two loadchecks.</p>	<p>the two most abundant “organics” material types found at landfills and/or curbside pick-up collection systems were “Uncoated Corrugated Cardboard” and “Food”. Furthermore, the 2014 study used a confidence interval of 90% for all data calculations (2014 Disposal Facility- Based Characterization of Solid Waste in California, Page 22). Applying this information to the equation outlined in the ASTM publication, of a 200-pound sample and a precision of 10%, yields a required sample number of 49 for “Uncoated Corrugated Cardboard” and 24 for “food”. Since “Organic Waste Recovery Efficiency” is not specific to a material type such as “Uncoated Corrugated Cardboard” or “Food”, rather just “Organic” or “Not Organic”, it is rational to average the 2 numbers (a sample number of 49 for “Uncoated Corrugated Cardboard” and 24 for “food”) and present a more inclusive required sample number. The average of those two numbers is 37 samples.</p> <p>Additionally, after consulting with divisions within CalRecycle, a significant number of jurisdictions use “Every other week” collection for a portion of their waste stream. Many of these jurisdictions use the same facility or facilities for waste processing. A consecutive two-week sampling standard would ensure that jurisdictions with “Every other week” collections streams are reflected in the sampling. Based on the expert data 10 consecutive days was used instead of 14 to help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>The 200 pounds is what was used for the Statewide waste characterization studies performed during the past 5 years by California (CalRecycle), Washington, New York, Georgia and Connecticut have used a sample weight between 200 to 300 pounds. Furthermore, ASTM international (American Society for Testing and Material) also suggests a minimum sample weight of 200 pounds be used in waste characterization related studies.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p> <p>Regarding the loadchecking:</p> <p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
9231	Bowers, M., Sunnyvale	Section 21695	CalRecycle has revised Section 21695 in response to comments. The changes to the regulatory text include the requirement that operators identify those areas in the landfill that would remain

Comment Number	Received From	Question/Comment	Response(s)
		<p>The Status Impact Report (SIR) is required of all landfill operators within 180 days of the effective date of the regulations. The practical purpose of this costly requirement is not evident. The disposal reductions created by increased diversion of organics will not have yet occurred. Sources and flows of disposed waste are complex and operators are likely to be unable to predict with any accuracy how future quantities will change as a result of the regulations, in terms of either mass or volume. This means that each analysis and report will be based primarily on speculation by the engineer or certified engineering geologist who prepares the report. The complexity of primary and secondary flows of diverted organics may result in unexpected disposal decreases at some sites and unexpected increases at other sites that (for example) specialize in receiving residues from organics processing.</p> <p>The ISOR document does not provide any insight into the overall purpose of this requirement or the individual required actions. The ISOR statements provide no insights, as they are almost entirely couched in circular reasoning that says, in effect, "the purpose is to require operators to do what the regulations tell operators to do." The ISOR language reveals no apparent purpose for this exercise and there does not appear to be a link between this section and the statutory language in SB 1383.</p> <p>Given the above, we recommend that CalRecycle either:</p> <ol style="list-style-type: none"> <li>1) Delete Section 21695 entirely, or</li> <li>2) If gaining useful information on changes to landfill flows, closure dates, etc. resulting from disposal flow changes caused by SB 1383 is a priority, delay by 3-5 years the date on which these reports are due, and make the requirement conditional on actual, observed changes in flow to a particular landfill that exceed a specified threshold (e.g. an increase or decrease of more than 10% from 2018 tonnages).</li> </ol> <p>As written, Section 21695 does little more than soak up cost and technical skill. That money and skill would be better spent focusing on designing, funding, siting permitting and operating the organics diversion facilities needed to achieve the diversion goals of SB 1383.</p>	<p>with intermediate cover and to extend that date for submittal of the Status Impact Report (SIR) from 180 days to one year (365 days) from the effective date of these regulations.</p> <p>The SIR is a site specific, one-time submittal that is prepared by the operator after they have reviewed their landfill operations to determine any potential impacts from the reduction of organic disposal (waste flow) to their landfill. The one-year timeframe established in this regulation for the submittal of the SIR is intended to assist the operator in determining and assessing in the timing of those impacts in order properly implement any changes or modifications to the landfill in a timely manner. Because only the potential impacts associated with the reduction of the amount waste disposed will be reviewed, staff believe that one-year from the effective date of the regulations is an adequate amount of time for the operator to meet the requirements of this section.</p> <p>In addition, this section provides a list of items to be considered by the operator in order to assist them complete the SIR. This information in items listed is needed in order to adequately evaluate the potential impacts to the landfill resulting from the reduction of organic disposal at landfills. If there will be no changes to a particular item, then a statement to that effect would be adequate.</p>
9232	Bowers, M., Sunnyvale	Please see attached document. Protocols for Waste Characterization study	Comment noted, thank you for providing reference material.
9233	Bowers, M., Sunnyvale	Please see attached document. Waste Characterization Methodology	Comment noted, thank you for providing reference material.
5015	Braicovich, J, CR&R Environmental Services	<p>The definition of Organic Waste is too broad and ambitious and has the potential of creating confusion with the public and solid waste handlers regarding SB 1383. The definition, for example, includes paper products, which are further defined as "paper janitorial supplies, cartons, wrapping, packaging, file folders, and hanging files, building insulation and panels, corrugated boxes, tissue, and toweling." Many of these material types are not typically accepted in organic waste recycling streams. Additionally, the definition includes the term "organic textiles and carpet".</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>How is one to accurately determine what is considered organic versus non-organic carpet and textiles? It is critical that the definition clearly separate out what materials are expected to be collected and managed programmatically from other material. In addition, for AD systems such as ours, these materials do not possess any energy value and they disrupt the biological process inside our digesters. Paper products have always been a part of the regular recycling stream and they should stay there in order to avoid confusion by the general public.</p> <p>Organic textiles and carpet should be left in the regular waste stream because it will be virtually impossible for haulers to be able to differentiate organic vs. non-organic materials. We strongly urge Cal Recycle to strengthen the current producer responsibility regulations for carpet in order to divert these materials and avoid additional confusion by including them in the definition of organic waste.</p>	<p>therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Textiles and carpets are not normally accepted by organic waste recycling facilities such as composting or in-vessel facility that takes materials in green containers. However, CalRecycle included this provision allowing textiles in green containers because stakeholders during the informal rulemaking workshops requested such flexibility. CalRecycle is not aware of any compelling reason to prohibit textiles from being placed in green containers.</p> <p>While carpets and textiles may be handled in a different manner, some jurisdictions may allow them to be placed in the gray container. Carpets and textiles are allowed in the gray container regardless of where the contents of the container are subsequently managed i.e. if these are the only organic wastes allowed in the gray container the container does not have to be transported to a high diversion organic waste processing facility.</p>
5016	Braicovich, J, CR&R Environmental Services	<p>Section 18984.1 Three - container Organic Waste Collection Services Current language states that the blue container may be used to collect organic waste including "textiles". As presented, it appears the terms textiles and organic textiles are intended to be synonymous. Is the term textiles meant to be organic textiles per the definition of organic materials? Cal Recycle must keep in mind that it has taken over 30 years to train the general public on what is recyclable and what is not. Adding textiles and carpet to the proposed definition of organic waste will only serve to further confuse the public and increase contamination rates. Section 18984.2 Two-container Organic Waste Collection Services It is stated that carpet and textiles may be placed in the gray container. Are these meant to be the same terms as organic carpet and textiles? If so, the terms need to be modified. If this is the case, then why even define these materials types as organic materials as it even creates more confusion. We strongly urge CalRecycle to eliminate organic carpet and textiles from the definition of Organic Waste.</p> <p>Subsection 2 makes it clear that the green container is only for the collection of organic waste. In Subsection 3 it says if either container is intended for the collection of both organic waste and nonorganic waste. This is confusing.</p>	<p>Yes, this refers to organic textiles. In the two container collection system, the language was revised so textiles do not go in the gray container. Also, any organic waste that is not specifically allowed in the blue container can go in the gray container.</p>
5017	Braicovich, J, CR&R Environmental Services	<p>Section 18984.5 Container Contamination Minimization CR&amp;R has over 1,000 collection routes with approximately 900-1000 customers per residential route. This equates to an inordinate amount of route sampling that would have to take place on a quarterly basis. If only 10% of the containers were sampled on a quarterly basis this would result in the need to sample approximately 100,000 containers per quarter or, approximately 1,500 containers daily. This is not practical, realistic or attainable. It is suggested that the frequency of audits be reduced to an annual activity with no more than 1% sampling requirement. If the current requirements are maintained it would require an increase in the number of routes that we are currently running and an increase in the number of route</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. The regulations were revised to annual. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>auditors which would in turn increase miles driven and increase our carbon footprint.</p> <p>The current regulations address finding prohibited container contaminants in a container as being an issue. While too much contamination is potentially an issue, every container contains some level of contamination. There needs to be some level of guidance regarding what level of contamination is considered acceptable. Also, please keep in mind that CR&amp;R has invested millions of dollars on front-end clean-up systems, in addition to public education and outreach, in order to produce clean organics for our digesters. We have been recycling for decades and we understand that when you're dealing with the general public there will always be some level of contamination, no matter how much public education you do. Our investment in our front end clean up systems are meant to do what the customer may not do.</p>	<p>monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
5018	Braicovich, J, CR&R Environmental Services	<p><b>Section 18984.11 Waivers and Exemptions Granted by a Jurisdiction</b></p> <p>It is stated that a jurisdiction may request a waiver for commercial businesses that have 2 cubic yards of waste per week and organic waste of less than 20 gallons per week. This is overly burdensome on these small businesses and has the potential of creating poor relationships between haulers, jurisdictions and businesses. These small businesses contribute very little to the overall solid waste generation and recovery in jurisdictions. This can be supported with empirical data. When jurisdictions were required to perform waste generation studies under the auspices of AB 939, through Cal Recycle staff reviews, it was determined that these small businesses contributed very little to the waste stream. Historical information supporting this claim should be readily available at CalRecycle headquarters. It is suggested that rather than creating a waiver and exemption process for these entities, they should be permanently exempted.</p> <p><b>Section 18986.3 Waivers for Non-Local Entities and Local Education Agencies</b></p> <p>There should not be a process to waive entities that produce two cubic yards or less of materials. This should just be done automatically as materials in these containers do not have much of an impact on the overall program success. Managing the waste in these containers is very time consuming for the overall benefit of the program. If generators of these containers want to participate in the program that would be acceptable, but do not mandate it.</p>	<p>Automatically and permanently exempting small businesses could compromise the state's ability to achieve the organic waste reduction targets. According to jurisdictions with similar de minimis waivers, very few businesses would qualify for this waiver, so automatically and permanently exempting all small businesses would undercut organic waste diversion and the goals of SB 1383. Permanently exempting non-local entities and local education agencies would compromise the state's ability to achieve the organic waste diversion goals for the same reasons. Although these entities may produce smaller amounts of organic waste than other generators, the cumulative impact of permanently exempting them from the collection requirements, even if they produce more than two cubic yards of materials, would be considerable.</p>

Comment Number	Received From	Question/Comment	Response(s)
5019	Braicovich, J, CR&R Environmental Services	<p>Section 18993.1 Recovered Organic Waste Product Procurement Target</p> <p>If a hauler is producing RNG fuel from the processing of their organics and then using all of that fuel in their collection vehicles for the purpose of providing near zero emission, sustainable collection services for their particular community, they should be allowed to become a designee of the jurisdiction. The use of a designee is already used in these regulations for other purposes. In addition, if a hauler is already marketing the compost that it produces from their anaerobic digestion process, and using the material in organic bagging operations on a large scale, those activities should not be counted against the hauler or jurisdiction either. We have worked extremely hard to create sustainable end markets for our materials (RNG and compost) and we think consideration needs to be given for those activities. Our jurisdictions do not need to worry about procuring their materials because we are taking care of the back end process for them. Consideration must be given to on-going AD technologies and processes which currently divert organics from the landfill and provide a highest and best use for the endproducts. The use of a designee should hold consistent for other procurement activities as well. We are not opposed to the current language but there should also be language that allows for technologies like ours to count towards the jurisdiction's procurement requirements.</p>	<p>CalRecycle disagrees with the interpretation that a designee, such as a hauler, would not be eligible to count towards a jurisdiction's procurement target. The current draft regulations allows a jurisdiction to meet its recovered organic waste product procurement target through a direct service provider, who procures recovered organic waste product(s) on behalf of that jurisdiction. CalRecycle has revised the regulatory text in Section 18982(17) to amend the definition of "direct service provider" to clarify that a contract or other written agreement, for example a Memorandum of Understanding (MOU), could be used to prove the direct service provider relationship.</p>
5020	Braicovich, J, CR&R Environmental Services	<p>Section 18995.1 Jurisdiction Inspection and Enforcement Requirements</p> <p>A compliance review of all commercial garbage accounts in a jurisdiction is not practical or feasible for jurisdictions as the cost is extremely prohibitive as compared to the potential gains that are received. In some cases we are talking about literally tens of thousands or millions of accounts. Reviewing all these accounts is simply impractical and unattainable. Additionally, as mentioned above, businesses with containers of 2 cubic yards or less should be automatically exempted from the program as they contribute very little to the overall volume of solid waste generated in a city.</p>	<p>A change to the regulatory text is not necessary. A compliance review does not require a physical inspection of each commercial business that is subscribing to collection service. This was intended to be a desk review of all garbage accounts within the jurisdiction and to verify collection service. Businesses that generate less than two cubic yards of solid waste and produce organic waste are excluded from this requirement.</p>
5021	Braicovich, J, CR&R Environmental Services	<p>Section 17402.a.(7.5) Transfer/Processing Operations and Facilities Regulatory Requirements Definitions</p> <p>"Incompatible material includes organic waste that the receiving end-user .... ". How is this specifically being defined? For example, do palm tree waste and other such materials that may pose an issue for a particular facility become exempted? This appears to be a situation of case by case analysis. How are final determinations to be made?</p>	<p>A change to the regulatory text is not necessary. Yes, your understanding is correct that "incompatible material" is determined by what the receiving end-user is designed, permitted, or authorized to process. In your example, if the end-user is not designed to receive palm tree waste then it would be considered "incompatible material" instead of recovered organic waste. Basically, the final determination of what a receiving facility can accept would be based on the receiving facilities permit. In addition, the facility can reject any load the operator determines cannot be processed or if they determine the level of contaminant is too high.</p>
5022	Braicovich, J, CR&R Environmental Services	<p>Section 17409.5 Load checking- Prohibited Wastes</p> <p>The requested load checking is much too frequent. If an operator does not have a history of excessive contamination and their material is considered clean by the end user of the material, there is no need for this activity. Because it is in the best interest of the processor to maintain a clean operation, let the operator handle their contamination issues. If the operator overlooks contamination in their material, they will be impacted financially as the material will either be significantly</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>downgraded or rejected by the end user, which is enough financial incentive for the operator to keep materials clean. If this activity is not eliminated at least change the frequency to no more than once per quarter.</p> <p>Section 17409.5. 7 Load checking - Contamination in Source Separated Organic Waste</p> <p>The amount of load checking is too frequent and there are no standards established. What is considered a contaminant? Title 14 requirements which often results in one load check per day should be adequate. We are not sure what is being achieved by this language. We should prioritize looking for "significant" visible contamination to ensure we are addressing the most contaminated streams. Again, it is already in the processors best interest to minimize contamination &amp; have systems in place to remove contamination if necessary.</p>	<p>jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
5023	Braicovich, J, CR&R Environmental Services	<p>Section 17409.5.1 Organic Waste Recovery Efficiency</p> <p>This process is too frequent and potentially extremely costly, it will take up too much floor space and create logistical and personnel safety issues. Rather than daily sampling, allow for periodic sampling of one week per quarter.</p> <p>Section 17409.5.2 Measuring Organic Waste Recovered from Mixed Waste Organic Collection Stream</p> <p>Taking one cubic yard samples from each organic waste type separated after processing at the facility on that operating day is not workable. There are too many waste types defined under these proposed regulations. This activity would take up too much valuable working floor space in addition to disrupting business activity and creating an unsafe working condition for staff. Please keep in mind that anytime you place human beings alongside heavy equipment the probability of an accident, injury or death increases significantly. This would also be a very time consuming and costly endeavor each time the sampling would take place. Even doing this activity based upon material type on a periodic basis would create a hardship for operators of these facilities. This process needs to be significantly scaled back or eliminated all together for safety and logistical reasons.</p> <p>Section 17409.5.6 Source Separated Organic Waste Handling</p> <p>This may conflict with safety and space considerations at some facilities. With all the space required for the various types of sampling that is to take place on site, where is the additional space going to exist for separating these waste piles from other organic materials. We need to better evaluate these proposed activities from an operational and safety standpoint. Most facilities were not designed with footprints as large as would be required for all the sampling. By squeezing in more and more activities in a confined area we will be potentially increasing the chance of an injury, accident or worse.</p> <p>Section 17409.5.8 Incompatible Materials Limit in Recovered Organic Waste</p> <p>Perform this activity on a periodic sampling basis as mentioned above. Change the frequency of sampling to a, one-week sampling per quarter. If an operator does not</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. This is needed to determine the efficiency of the facility in order to make required determinations in Article 3.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite for 10 consecutive days per reporting period (which is on a quarterly basis), instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p> <p>Regarding the loadchecking:</p> <p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>comply, then increase the frequency to maybe a monthly activity until compliance is reached.</p> <p>Section 17409.5.11 Remnant Organic Material in the Gray Container Collection Stream See above comments regarding load checking activity and safety concerns.</p> <p>Section 17867 Composting Operation and Facility Siting and Design Standards See above comments regarding load checking activity and safety concerns.</p> <p>Item (16) of same section As mentioned above sampling of residuals is not very practical or safe. A possible approach that would provide a reasonable estimate would be to provide estimates based upon a visual sample of the materials supported by photographic evidence.</p> <p>Section 17896.25.1 Load checking - Contamination in Source Separated Organic Waste See above comments regarding load checking activity.</p>	
5024	Braicovich, J, CR&R Environmental Services	<p>Section 17409.5.3 Measuring Organic Waste in Residuals Removed from Mixed Waste Organic Collection Stream Residuals mostly consist of commingled materials and are physically too small to accurately define by material type and weight. The accuracy of this activity is highly questionable and would be extremely costly. While it may offer additional information for Cal Recycle to obtain, the value of the data is highly questionable and of little or no value. At most this activity should only be periodic, as stated above. Visual inspections indicating estimates should be allowed as a means of measurement. This information could be supported by photographic information.</p> <p>Section 17409.5.4 Measuring Organic Waste Recovered from Source Separated Organic Waste Collection Stream This is the same discussion as Section 17409.5.2 described above. Taking samples by specific waste types and weight on a daily basis is simply not practical or safe and in many cases. It is logistically not feasible. Also, as similar to all the requested sampling measurement processes mentioned in these regulations there is no guidance regarding expected accuracy.</p> <p>Section 17409.5.5 Measuring Organic Waste in Residuals Removed from Source Separated Organic Waste Collection Stream This is similar to discussion that describes Section 17409.5.3</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. For statewide consistency, it is necessary to specify how a facility is to measure recovery efficiency to determine if it meets the definition of a high diversion organic waste processing facility.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample be a random and representative of a typical operating day for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard.</p> <p>The sampling frequency 10 consecutive days was based on that 2 consecutive weeks per quarter, yielding 10 samples per quarter and 40 samples per year. This is consistent with ASTM calculation method (Standard Test Method for Determination of the Composition of Unprocessed Municipal Solid Waste; ASTM International; Designation: D-5231-92 (Reapproved 2003)) for estimating the number of samples required to achieve a pre-determined precision of specific material type. Using data from the "2014 Disposal-Facility- Based Characterization of Solid Waste in California", the two most abundant "organics" material types found at landfills and/or curbside pick-up collection systems were "Uncoated Corrugated Cardboard" and "Food". Furthermore, the 2014 study used a confidence interval of 90% for all data calculations (2014 Disposal Facility- Based Characterization of Solid Waste in California, Page 22). Applying this information to the equation outlined in the ASTM publication, of a 200-pound sample and a precision of 10%, yields a required sample number of 49 for "Uncoated Corrugated Cardboard" and 24 for "food". Since "Organic Waste Recovery Efficiency" is not specific to a material type such as "Uncoated Corrugated Cardboard" or "Food", rather just "Organic" or "Not Organic", it is rational to average the 2 numbers (a sample number of 49 for "Uncoated Corrugated Cardboard" and 24 for "food") and</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>present a more inclusive required sample number. The average of those two numbers is 37 samples.</p> <p>Additionally, after consulting with divisions within CalRecycle, a significant number of jurisdictions use “Every other week” collection for a portion of their waste stream. Many of these jurisdictions use the same facility or facilities for waste processing. A consecutive two-week sampling standard would ensure that jurisdictions with “Every other week” collections streams are reflected in the sampling. Based on the expert data 10 consecutive days was used instead of 14 to help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>The 200 pounds is what was used for the Statewide waste characterization studies performed during the past 5 years by California (CalRecycle), Washington, New York, Georgia and Connecticut have used a sample weight between 200 to 300 pounds. Furthermore, ASTM international (American Society for Testing and Material) also suggests a minimum sample weight of 200 pounds be used in waste characterization related studies.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
5025	Braicovich, J, CR&R Environmental Services	<p>Section 17896.44.1 Measuring Organic Waste in Residuals (at an In-Vessel Digestion Facility)</p> <p>There are no residuals after processing at the digester. The material removed is digestate which goes to an end user. Additionally, it is not possible to measure residuals in digestate as it is not in any kind of material form but a sludge like substance.</p>	A change to the regulatory text is not necessary. Section 17409.5.9 allows the EA, with concurrence from CalRecycle, the flexibility to approve an alternative measurement as long as the method proposed by the operator is as accurate as the prescribed protocol.
2000	Brazil, Laureteen; El Cerrito Operations + Environmental Services Division	(I don't support incineration/gasification etc.)	Comment noted.
2001	Brazil, Laureteen; El Cerrito Operations + Environmental Services Division	Now that the most valuable plastics are narrow-necked containers, primarily #1 and #2, to keep recycling equipment (carts and lids) out of the landfill, will there be a requirement for closed-loop manufacturing, that is, a State level requirement to use that material as feedstock for new equipment to keep it out of the landfill?	These regulations do not target plastic recycling and have no provisions specific to the recycling of collection carts. This is a rulemaking to ensure organic waste diversion from landfills.
2002	Brazil, Laureteen; El Cerrito Operations + Environmental Services Division	<p>Are camp grounds and Marinas that rent water equipment like boats, jet skies etc included in this law? I ask because a lot of organics (and recyclables) are generated at outdoor events, on camp grounds, at lake parties over the summer months.</p> <p>Many of these locations don't recycle and have yet to start a composting program. How does the law address their activities?</p>	Yes, the regulations apply the organic waste generator requirements to commercial businesses.

Comment Number	Received From	Question/Comment	Response(s)
2003	Brazil, Laureteen; El Cerrito Operations + Environmental Services Division	Will Transfer Stations accept food waste / food scraps for proper disposal? They accept vegetation but will their organics program be required to accept all organics for commercial composting?	Comment noted. Not all Transfer/Processing facilities are permitted to receive food waste. A Transfer/Processing Facility cannot be forced to take food waste, even if it is taking other types of organic waste (green waste, cardboard, etc.).
3320	Brown, D., Carton Council	The CalRecycle document, Summary of Changes Made to the Proposed Organic Waste Reduction Regulations lists on page 1 one of the changes made as: Removed restrictions on collecting plastic coated paper and textiles in the blue container. However, the proposed regulations on page 18 state: Article 5. Generators of Organic Waste Section 18986.1. Non-Local Entities Requirements... .....(1) The following shall not be collected in the green container or blue container: (A) Textiles, carpets, plastic coated paper, and human or pet waste. Please remove the reference to restricting plastic coated paper from the blue container in this and all other sections, as we believe was your intent.	Thank you for the comment. CalRecycle amended the applicable sections for consistency.
6030	Brown, K., Citizen of Oakland	Community composting sites are important for educating the public about the composting process, which leads to their greater understanding of both biology and of what goes into making good compost. That knowledge is transferrable to community buy in for larger scale corporate waste management models and helps ensure a reduction in contaminants that ends up in these industrialized composting operations.	Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.
6031	Brown, K., Citizen of Oakland	Community compost operations produce better compost and improve soil quality. Corporate produced compost is filled with C&D debris and is low quality.	Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.
6032	Brown, K., Citizen of Oakland	Small scale community compost sites are quick to start, low-cost, and with volunteers can process a quantifiable amount of food waste from their neighbors.	Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.
6033	Brown, K., Citizen of Oakland	SB 1383 will require cities to sign exclusive franchise agreements with out of state owned corporations to manage their compliance with the regs. The contracts make it illegal for neighbors to transport organic materials over city streets to our community composting site.	Franchise agreements are beyond CalRecycle's authority to regulate.
6339	Brown, T., City of Moorpark	Infrastructure Capacity: Neither the state as a whole, nor Ventura County locally, currently has the infrastructure needed to meet the demand for the proposed new organic waste processing. While we share the goal of developing the capacity to	The regulations include a provision to allow for a Corrective Action Plan if a jurisdiction has demonstrated substantial effort and has extenuating circumstances. In the 15-day language,

Comment Number	Received From	Question/Comment	Response(s)
		<p>receive and recycle organic waste on a very large scale, we are not likely to be able to meet that demand within the timeframes provided...Therefore, additional time to implement organic waste collection services is recommended.</p>	<p>CalRecycle has also provided an accommodation with a waiver from the collection requirements for rural jurisdictions and after 2025 for low population jurisdictions.  Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
6340	Brown, T., City of Moorpark	<p>Financial Effects on Residents and Businesses Due to Recyclables Market Collapse: Like many cities, Moorpark had to approve extraordinary rate increases in 2018 and 2019 to maintain the financial viability of our waste haulers in light of the collapse of the international recyclables market following China’s “Green Wall” policies. As a result of these extraordinary increases, standard residential trash service costs in Moorpark have increased from \$26.36 per month in January 2018 to \$31.95 per month in January 2019 – an increase of more than 20% in just twelve months. Standard commercial recycling costs have increased from \$74.31 per month in January 2018 to \$116.88 per month in January 2019 – an increase of more than 57% in twelve months. Further burdening the public with the increased costs of collecting and hauling organic food waste on a large scale will compound the challenges for consumers that are already facing skyrocketing solid waste bills as Californians seek to save the nonorganic recycling industry from further collapse. Therefore, added costs to consumers should be carefully balanced with meeting environmental goals.</p>	<p>A change to the regulatory text is not necessary. Comment noted. Comment is not recommending a change to the regulatory text.</p>
6341	Brown, T., City of Moorpark	<p>Funding to Implement Trash Container Color Standardization: The proposed regulations mandate the color of trash containers: green for organic waste, blue for non-organic recyclables, and gray for non-organic waste. This requirement will certainly help large-scale, statewide initiatives to educate the public about how to properly dispose of waste, and the City is supportive of that. However, Moorpark customers will need to swap the colors of its blue and gray bins, at costs that will</p>	<p>The Legislature in SB 1383 authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>ultimately be passed on to Moorpark customers. The colors harken back to the City's historic franchise hauler having a corporate color of blue, resulting in blue trash cans in the era of single-stream waste collection. When two-can recycling was introduced, a gray can was added because the non-recyclable containers were already blue. Financial support to effective these color changes, especially in light of the financial hardships described above, would be desirable.</p> <p>Therefore, a funding mechanism is requested to help implement trash container color standardization efforts.</p>	
6342	Brown, T., City of Moorpark	Specifically targeting local jurisdictions for this special requirement disproportionately burdens local government with these costs, even though they represent a miniscule amount of the products purchased in	A change to the regulatory text is not necessary. The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in substantial additional costs. Furthermore, CalRecycle cannot impose procurement mandates on other state agencies or sectors without the necessary statutory authority, which SB 1383 lacks.
6343	Brown, T., City of Moorpark	Therefore, CalRecycle should work to develop statewide or other large-scale markets for recycled materials and develop any procurement requirements separately from these regulations.	CalRecycle disagrees with the suggestion to phase-in procurement or to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved. However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022.
4122	CA Compost Coalition (Edgar, E, CA Compost Coalition)	<p>Article 1 The "organic waste" definition should focus on methane-generating waste, since SB 1383 is a short-lived climate pollutant strategy and should exclude carpets and textiles, which do not have posted emission reduction factors. Methane yield for solid waste components has MSW at 1.62 metric tons of carbon dioxide equivalents per wet short ton, where OCC is 2.62, magazines are 2.59, office paper is 3.89 and newspaper is 1.05. Food waste is 1.75 and yard trimmings vary from 0.57 to 0.85. Wood is low at 0.17.</p> <p>Carpets and textiles are wastes that cannot be composted, anaerobically digested, or qualify as biomass conversion, and should be removed from the definition. Carpet has its own EPR program with Carpet Care. Textiles should also have a program outside of SB 1383.</p>	Comment noted. The suggestion is beyond the legislative intent of SB 1383 as it applies to CalRecycle. The relevant statutory provisions are to divert organic waste from landfill disposal rather than achieving quantifiable methane reduction targets.
4123	CA Compost Coalition (Edgar, E,	Article 2 CCC supports technologies that constitute a reduction of landfill disposal, using composting as a benchmark technology. The industry should have the	Thank you for your support.

Comment Number	Received From	Question/Comment	Response(s)
	CA Compost Coalition)	flexibility to investigate emerging technologies that constitute reduction in disposal based upon reducing methane generation.	
4124	CA Compost Coalition (Edgar, E, CA Compost Coalition)	<p>Article 3 The three-container organic waste collection service is fantastic and has become the default collection service for most of California. With the China Sword, Californians learned that wishful recycling by placing most dry material in the blue cart backfired because offshore remanufacturing has lowered contamination limits for feedstock. ‘When in doubt, generators are now throwing it out’ to keep the recyclables cleaner. We cannot embark upon wishful composting with these new organic tons needing to be diverted, where anything that claims to be ‘compostable’ or ‘biodegradable’ is placed in the green cart. Standardized labeling throughout California on what is really compostable is needed. In concert with SB 1383, new packaging laws are needed on what is truly compostable so as not to contaminate the compost or greenwash generators. Registered “organic” composters need to be careful on feedstock types to maintain their status.</p>	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. CalRecycle has sought to address this concern in a manner that is also in compliance with the statutory targets and requirements. As noted in the Initial Statement of Reasons, which was released for public review in January of 2019:</p> <p>“The draft regulations originally prohibited jurisdictions from implementing new mixed waste processing systems after 2022, and required all new services to implement source-separated curbside collection as a means of ensuring that collected organic waste would be clean and recoverable. In response to stakeholder feedback, CalRecycle eliminated the prohibition on new mixed waste processing systems provided that the receiving facilities demonstrate they are capable of recovering 75 percent of the organic content received from the mixed waste stream on an annual basis. The performance standard addresses stakeholder concerns about limiting flexibility, without compromising the goal for the regulations to achieve the statutory requirements.”</p> <p>The ISOR goes on to note that CalRecycle crafted regulations to allow for mixed waste collection provided that these collection services transport collected material to a facility that recovers 50 percent of the organic content it received by 2022 and 75 percent by 2025:</p> <p>“With very few exceptions, unique materials can only be processed and recovered when they are kept separate from other materials. This is primarily due to the fact that distinct materials are recovered through separate processes that are specifically designed to handle only that type of material. For example, metals, paper, and plastics are remanufactured through distinct processes (e.g. metal is smelted, paper is pulped and washed). Largely because of this, while material may be valuable as a homogenous commodity, it can become difficult or impossible to recycle when it is contaminated with other materials (e.g. many materials lose their value when they are commingled with other materials.) This principle holds true, and is perhaps more of a factor in the recovery of organic waste. Required source-separation of organic waste helps ensure that organics are kept clean, separate and recoverable.</p> <p>However; throughout the informal regulatory engagement process stakeholders raised concerns about potential costs associated with providing commercial and residential generators with a third container to source separate organic waste.</p> <p>Stakeholders also noted that several cities and counties implement single container collection services and process all the collected material for recovery. Stakeholders argued that allowing the use of a single-container collection system is a viable and cost-effective alternative that can help the state meet that statutory organic waste recovery targets.</p> <p>To respond to stakeholder requests for additionally flexibility CalRecycle crafted this section and Section 18984.2. These sections allow alternatives to providing a three-container source-separated organic waste collection service. Under these section jurisdictions are allowed to require their generators to use a service that does not provide the generators the opportunity to separate their organic waste for recovery at the curb. In order to ensure that the state can</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>achieve the statutory organic waste reduction targets, these collections services are required to transport the containers that include organic waste to high diversion organic waste processing facilities that meet minimum organic content recovery rates (content recovery rates are specified in Subdivision (b) of this section)..."</p> <p>The commenter has stated in each comment period, that they believe the requirement to recover 75 percent of the organic content collected in these mixed waste collection services is unrealistic and infeasible. In turn CalRecycle staff repeatedly communicated to the commenter that the recovery targets cannot be lowered without compromising the integrity of the regulations. This was further documented for this commenter and the public in the ISOR:</p> <p>"These minimum recovery rates are necessary because when the opportunity to recover material through source separation is lost, the state must ensure that minimum recovery levels are met at processing facilities. While this section provides additional flexibility to jurisdictions, CalRecycle must consider its obligation to ensure that the regulations are designed to achieve the statutory targets. If 100 percent of jurisdictions employed this collection option in 2022 the state could not meet the mandatory recovery target of 50 percent unless at least 50 percent of the organic waste collected from these services is recovered.</p> <p>Similarly, if 100 percent of jurisdictions employed this collection option in 2025 the state could not meet the mandatory recovery target of 75 percent unless 75 percent of the organic waste collected from these services is recovered.</p> <p>Therefore, in order to meet the recovery targets specified in statute and the state's ultimate climate goals the recovery standards included in this section are the minimum standards necessary.</p> <p>As generation of organic waste increases with population growth, these minimum recovery rates may need to be revisited. As stated previously the organic waste reduction targets are linked to a 2014 baseline of 23 million tons. This requires the state to dispose of no more than 5.7 million tons by 2025. If, as CalRecycle projects, generation increases to 26 million tons of organic waste by 2025, recovering 75 percent of 25 million tons will only reduce disposal to slightly more than 6 million tons, resulting in the state missing its organic waste recovery targets. The need for this rate increase could be mitigated if higher recovery rates are achieved through source separation, or if efforts to increase source reduction through food recovery and other methods are successful. However, the recovery rates established in this regulation should be considered an absolute minimum."</p> <p>CalRecycle has, prior to and during this rulemaking, communicated that the recovery efficiency requirements established in the regulation is the minimum level that the statute can tolerate. The commenter suggests existing infrastructure that cannot meet this standard should be "protected" or provided a "safe-harbor." The commenter requests changes in the proposed regulations that cannot be reconciled with the statutory targets because CalRecycle finds that it cannot propose a regulation consistent with a statutory 2025 target that permits an unknown portion of the state from implementing the requirements necessary to achieve that target.</p> <p>CalRecycle acknowledges the role of existing infrastructure and acknowledges that previous investments in infrastructure were consciously made to achieve targets that were established prior to the adoption of SB 1383. However, the legislative direction in SB 1383 is unmistakably</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>clear. The Legislature required CalRecycle to adopt regulations to achieve mandatory organic waste reduction levels. Nothing in the regulations prevents facility operators or jurisdictions from investing in facility upgrades or adapting existing facilities to process waste in a manner that meets the minimum regulatory requirements.</p> <p>Comment noted. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4125	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 3 The three-container organic waste collection services will be able to meet the target of reducing organic wastes by 50% sometime past 2020. Since the reduction disposal targets are not on a jurisdiction or a landfill, CalRecycle will measure the program implementation based on statewide waste characterization studies to determine if the target has been met. California will be able to claim statewide success with source-separation and the three-container system and should not back down.	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. If 100 percent of jurisdictions employed this collection option in 2022 the state could not meet the mandatory recovery target of 50 percent unless at least 50 percent of the organic waste collected from these services is recovered.</p> <p>Similarly, if 100 percent of jurisdictions employed this collection option in 2025 the state could not meet the mandatory recovery target of 75 percent unless 75 percent of the organic waste collected from these services is recovered.</p> <p>Therefore, in order to meet the recovery targets specified in statute and the state's ultimate climate goals the recovery standards included in this section are the minimum standards necessary.</p> <p>As generation of organic waste increases with population growth, these minimum recovery rates may need to be revisited. As stated previously the organic waste reduction targets are linked to a 2014 baseline of 23 million tons. This requires the state to dispose of no more than 5.7 million tons by 2025. If, as CalRecycle projects, generation increases to 26 million tons of organic waste by 2025, recovering 75 percent of 25 million tons will only reduce disposal to slightly more than 6 million tons, resulting in the state missing its organic waste recovery targets. The need for this rate increase could be mitigated if higher recovery rates are achieved through source separation, or if efforts to increase source reduction through food recovery and other methods are successful.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>However, the recovery rates established in this regulation should be considered an absolute minimum.”</p> <p>CalRecycle has, prior to and during this rulemaking, communicated that the recovery efficiency requirements established in the regulation is the minimum level that the statute can tolerate. The commenter suggests existing infrastructure that cannot meet this standard should be “protected” or provided a “safe-harbor.” The commenter requests changes in the proposed regulations that cannot be reconciled with the statutory targets because CalRecycle finds that it cannot propose a regulation consistent with a statutory 2025 target that permits an unknown portion of the state from implementing the requirements necessary to achieve that target.</p> <p>CalRecycle acknowledges the role of existing infrastructure and acknowledges that previous investments in infrastructure were consciously made to achieve targets that were established prior to the adoption of SB 1383. However, the legislative direction in SB 1383 is unmistakably clear. The Legislature required CalRecycle to adopt regulations to achieve mandatory organic waste reduction levels. Nothing in the regulations prevents facility operators or jurisdictions from investing in facility upgrades or adapting existing facilities to process waste in a manner that meets the minimum regulatory requirements.</p> <p>Comment noted. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4126	CA Compost Coalition (Edgar, E, CA Compost Coalition)	<p>Article 3 The three-container system alone will probably not be able to meet the target of reducing organic waste by 75%, based upon evaluations of current programs and recent Request for Proposals. Since this is a statewide target - not on a jurisdictional level with proper program implementation or a landfill mandate - other programs are needed (such as high-diversion organic waste processing) in addition to the three-container system, in order to eventually get to 75%. There are hybrid programs that maintain the ability for a facility to process source-separated organics, and in addition process the gray cart with new MSW processing technologies to achieve the 75% recovery rate.</p>	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. CalRecycle has sought to address this concern in a manner that is also in compliance with the statutory targets and requirements. As noted in the Initial Statement of Reasons, which was released for public review in January of 2019:</p> <p>“The draft regulations originally prohibited jurisdictions from implementing new mixed waste processing systems after 2022, and required all new services to implement source-separated curbside collection as a means of ensuring that collected organic waste would be clean and recoverable. In response to stakeholder feedback, CalRecycle eliminated the prohibition on new mixed waste processing systems provided that the receiving facilities demonstrate they are capable of recovering 75 percent of the organic content received from the mixed waste stream on an annual basis. The performance standard addresses stakeholder concerns about limiting flexibility, without compromising the goal for the regulations to achieve the statutory requirements.”</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>The ISOR goes on to note that CalRecycle crafted regulations to allow for mixed waste collection provided that these collection services transport collected material to a facility that recovers 50 percent of the organic content it received by 2022 and 75 percent by 2025:</p> <p>“With very few exceptions, unique materials can only be processed and recovered when they are kept separate from other materials. This is primarily due to the fact that distinct materials are recovered through separate processes that are specifically designed to handle only that type of material. For example, metals, paper, and plastics are remanufactured through distinct processes (e.g. metal is smelted, paper is pulped and washed). Largely because of this, while material may be valuable as a homogenous commodity, it can become difficult or impossible to recycle when it is contaminated with other materials (e.g. many materials lose their value when they are commingled with other materials.) This principle holds true, and is perhaps more of a factor in the recovery of organic waste. Required source-separation of organic waste helps ensure that organics are kept clean, separate and recoverable.</p> <p>However; throughout the informal regulatory engagement process stakeholders raised concerns about potential costs associated with providing commercial and residential generators with a third container to source separate organic waste.</p> <p>Stakeholders also noted that several cities and counties implement single container collection services and process all the collected material for recovery. Stakeholders argued that allowing the use of a single-container collection system is a viable and cost-effective alternative that can help the state meet that statutory organic waste recovery targets.</p> <p>To respond to stakeholder requests for additionally flexibility CalRecycle crafted this section and Section 18984.2. These sections allow alternatives to providing a three-container source-separated organic waste collection service. Under these section jurisdictions are allowed to require their generators to use a service that does not provide the generators the opportunity to separate their organic waste for recovery at the curb. In order to ensure that the state can achieve the statutory organic waste reduction targets, these collections services are required to transport the containers that include organic waste to high diversion organic waste processing facilities that meet minimum organic content recovery rates (content recovery rates are specified in Subdivision (b) of this section)…”</p> <p>The commenter has stated in each comment period, that they believe the requirement to recover 75 percent of the organic content collected in these mixed waste collection services is unrealistic and infeasible. In turn CalRecycle staff repeatedly communicated to the commenter that the recovery targets cannot be lowered without compromising the integrity of the regulations. This was further documented for this commenter and the public in the ISOR:</p> <p>“These minimum recovery rates are necessary because when the opportunity to recover material through source separation is lost, the state must ensure that minimum recovery levels are met at processing facilities. While this section provides additional flexibility to jurisdictions, CalRecycle must consider its obligation to ensure that the regulations are designed to achieve the statutory targets. If 100 percent of jurisdictions employed this collection option in 2022 the state could not meet the mandatory recovery target of 50 percent unless at least 50 percent of the organic waste collected from these services is recovered.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Similarly, if 100 percent of jurisdictions employed this collection option in 2025 the state could not meet the mandatory recovery target of 75 percent unless 75 percent of the organic waste collected from these services is recovered.</p> <p>Therefore, in order to meet the recovery targets specified in statute and the state’s ultimate climate goals the recovery standards included in this section are the minimum standards necessary.</p> <p>As generation of organic waste increases with population growth, these minimum recovery rates may need to be revisited. As stated previously the organic waste reduction targets are linked to a 2014 baseline of 23 million tons. This requires the state to dispose of no more than 5.7 million tons by 2025. If, as CalRecycle projects, generation increases to 26 million tons of organic waste by 2025, recovering 75 percent of 25 million tons will only reduce disposal to slightly more than 6 million tons, resulting in the state missing its organic waste recovery targets. The need for this rate increase could be mitigated if higher recovery rates are achieved through source separation, or if efforts to increase source reduction through food recovery and other methods are successful. However, the recovery rates established in this regulation should be considered an absolute minimum.”</p> <p>CalRecycle has, prior to and during this rulemaking, communicated that the recovery efficiency requirements established in the regulation is the minimum level that the statute can tolerate. The commenter suggests existing infrastructure that cannot meet this standard should be “protected” or provided a “safe-harbor.” The commenter requests changes in the proposed regulations that cannot be reconciled with the statutory targets because CalRecycle finds that it cannot propose a regulation consistent with a statutory 2025 target that permits an unknown portion of the state from implementing the requirements necessary to achieve that target.</p> <p>CalRecycle acknowledges the role of existing infrastructure and acknowledges that previous investments in infrastructure were consciously made to achieve targets that were established prior to the adoption of SB 1383. However, the legislative direction in SB 1383 is unmistakably clear. The Legislature required CalRecycle to adopt regulations to achieve mandatory organic waste reduction levels. Nothing in the regulations prevents facility operators or jurisdictions from investing in facility upgrades or adapting existing facilities to process waste in a manner that meets the minimum regulatory requirements.</p> <p>Comment noted. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4127	CA Compost Coalition (Edgar, E,	Article 3 Container contamination minimization starts with proper container labeling and education to not fall into the trap of wishful composting. Whereas initial training and auditing is needed for new programs, the number of inspections	During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision

Comment Number	Received From	Question/Comment	Response(s)
	CA Compost Coalition)	and auditing can attenuate over time to reduce the frequency for programs that have reached the lower contamination rate or are already in place with proven results.	<p>to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4128	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 3 Container labeling and color requirements will standardize the industry, especially for new packaging products and compost operators that want to maintain their registered organic input material status. Keep in mind the cart color does not need to be replaced until the end of the useful life of the containers, or prior to 2032, whichever comes first.	Thank you for the comment. The comment is in support of the draft regulations.
4129	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 3 Waivers and exemptions should be granted by CalRecycle for cities with less than 5,000 tons disposed of in 2014, and less than 5,000 people. County areas having census tracts with less than 50 people per square mile can request waivers, but they are only good for up to 2 years. Rural exemptions are good until 2025, or for 5 years after CalRecycle determines that the 50% statewide reduction goals have not been achieved.	<p>CalRecycle added that a special district that provides solid waste collection services or a regional agency can apply for a waiver. The change is necessary to clarify that a special district that provides solid waste collection services and a regional agency would also be eligible to apply for any of the waivers in this section. CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA's definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a>); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-document history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife's black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>achieving SB 1383's organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection. Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals. CalRecycle agrees that most low-population areas that are granted a waiver by CalRecycle are likely to remain as qualifying low-population areas for longer periods of time; allowing a waiver to be operational for a longer period of time is warranted and will reduce the costs of compliance. CalRecycle has made a language change in response to this comment. After the change was made, commenters were in support that low population waivers are good for five years instead of two.</p>
4130	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 5 It is important to call on the non-local entities to comply with SB 1383.	The comment is in support of the proposed regulations, which require non-local entities to comply with SB 1383.
4131	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 8 Many jurisdictions already have a C&D Ordinance where CalRecycle has provided model ordinances in the past. CalRecycle should supply guidance in the form of model ordinance language.	CalRecycle will provide a model ordinance.
4132	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 10 The CalRecycle Food Waste Prevention and Rescue Grant Program has provided financial incentives and is generating program metrics to further develop these programs. Monitoring these grants, Cal- Recycle should provide model programs and documents for jurisdictions to utilize.	CalRecycle agrees with this comment and intends on providing information about model food recovery programs and operations in California prior to 2022.
4133	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 11 An overarching sustainable organic management plan is needed instead of cobbling the older CoIWMP with EARs and now the new Jurisdiction Compliance Reporting. For the time being, this article is needed to determine 15-year capacity.	Comment noted, CalRecycle recently conducted an analysis of compost and mulch infrastructure and will conduct a progress analysis in mid-2020. Article 11 requires jurisdictions to conduct capacity planning to ensure adequate infrastructure.
4134	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 11 Monitoring these grants, CalRecycle should provide industry metrics to determine edible food recovery capacity.	<p>CalRecycle intends on providing guidance and resources to help jurisdictions identify existing capacity at food recovery organizations and food recovery services, which may include existing surveys that have been developed specifically to help identify current edible food recovery capacity and capacity needs.</p> <p>In addition, CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county.</p>
4135	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 13 An overarching sustainable organic management plan is needed instead of cobbling the older CoIWMP with EARs and Implementation Records, as there is reporting but without a plan.	Comment noted. CalRecycle may consider streamlined jurisdiction reporting opportunities, such as modifying the Electronic Annual Report process.

Comment Number	Received From	Question/Comment	Response(s)
4136	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Article 14 CalRecycle should supply model inspection and enforcement programs, model ordinances and model format for the Implementation Record.	Comment noted. CalRecycle is developing a model ordinance and model franchise agreement.
4137	CA Compost Coalition (Edgar, E, CA Compost Coalition)	Measuring the organic waste recovered from the mixed waste organic collection stream and from the source-separated organic waste collection stream, where one cubic yard sample for each organic waste type after processing per each operating day is being proposed, and would be considered as over regulation and costly. This also rolls over to determining incompatible materials but not remnant organic materials. Whereas, as new and poor performing programs may need a higher frequency of sampling, the frequency of sampling needs to be modified based upon the proven performance of the operating facility, how a new facility operates, and the sources of the waste steam. The same can be said about measuring organic residual removed from the mixed waste organic collection stream, where once a facility shows sustained performance, the frequency of sampling should be far less than being required as daily sampling of one cubic yard.	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample be a random and representative of a typical operating day for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data. In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
4138	CA Compost Coalition (Edgar, E, CA Compost Coalition)	At landfills and transfer station there may be a loadcheck per day or per week that are random, or more frequent on problematic generators. Loadchecking for every 500 tons can lead to two loadchecks per day for a 1,000 TPD facility, and against intuition, CalRecycle is requiring 2 loadchecks per days for facilities under 500 TPD, and loadchecking for remnant organic material. Alternative frequencies could be established for programs with clean feedstocks.	CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations under Section 17409.5.7 in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
4430	CACC (Brown, K Community California Alliance for Community Composting (CACC))	<p>Ensure that “community benefit composting” or “micro-composting” organizations can operate even where a municipality has an exclusive franchise agreement with a waste management company. This can be done by enhancing the phrases used in Article 3 with the new definitions outlined above.</p> <p>“Nothing in this section prohibits a generator from preventing or reducing waste generation, managing organic waste on site, or using community benefit composting or micro-composting sites.”</p> <p>"Nothing in this section exempts a jurisdiction from complying with the other requirements to promote and provide information to generators about waste prevention, community benefit composting, micro-composting , managing organic</p>	<p>The terms community benefit composting and supplemental on-site compost are not used in the regulation.</p> <p>This comment proposes to add the definitions of ‘Community Benefit Composting’ and ‘Micro-composting’ to Article 1, thereby creating two additional categories of composting that do not reference the size and volume limitations of Section 17855(a)(4). The proposed terms for these two activities would expand the suite of activities that are not excluded from regulatory requirements. CalRecycle is not proposing amendments to the compost size thresholds in Section 17855, therefore the comment is not germane to the text CalRecycle is adopting or amending. The existing exclusion thresholds were thoroughly vetted and subject to stakeholder comment in a previous rulemaking amending those standards. No change to the regulatory text is necessary</p>

Comment Number	Received From	Question/Comment	Response(s)
		waste on-site, and other means of recovering organic waste, or any other requirements of this chapter.”	to specifically mention community composting because Section 18990.1(b) establishes that a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that would prohibit the lawful processing and recovery of organic waste.
4431	CACC (Brown, K Community California Alliance for Community Composting (CACC))	Publish a list of best management practices for community benefit composting and micro-composting. In Title 14, Chapter 3.1, add an amendment that recommends a voluntary self-assessment or voluntary state certification program in an effort to alleviate local regulatory concerns and inconsistencies across state agencies;	CalRecycle staff has noted the comment and will not make any further text changes in response. However, CalRecycle staff will develop tools to assist in the implementation of the regulations.
4432	CACC (Brown, K Community California Alliance for Community Composting (CACC))	Promote/encourage generators in rural jurisdictions that may qualify for “Rural Waivers and Exemptions” from waste collection services under §18984.12 to create rural farm composting cooperatives and supplemented on-site composting programs . This status would allow rural generators to source up to 30% of feedstock from off-site, including green material, agricultural material, agricultural by-product material, herbivore manure, and vegetative food material, alone or in combination to enrich on-site composting, by way of also being exempt from §18988.1(d).	Waivers are limited to specific situations and are designed to ensure that the vast majority of waste is still subject to the organic waste collection requirements. CalRecycle analyzed eliminating waivers in the cost analysis and found that this would increase the cost of compliance without substantially increasing organic waste reduction. Also, the comment about requiring rural areas to compost is outside scope of regulations.
2081	Campbell, Todd; Clean Energy Fuels	<p>We are concerned that the procurement requirements outlined in Article 12 for recovered organic waste products is too prescriptive and could lead to unintentional consequences, including potential RNG market disruptions.</p> <p>Section 18993.1</p> <p>(e) A jurisdiction shall comply with subdivision (a) by one or both of the following:</p> <ol style="list-style-type: none"> <li>(1) Directly procuring recovered organic waste products</li> <li>(2) Requiring through a written contract, that a direct service provider to the jurisdiction procure recovered organic waste products and provide written documentation to of such procurement to the jurisdiction.</li> </ol> <p>The issue with the procurement provision under Article 12 is there are only two recovered organic waste products that can be used for compliance.</p> <ol style="list-style-type: none"> <li>(1) Compost</li> <li>(2) Renewable Transportation fuel</li> </ol> <p>Nearly all the refuse haulers with NGV fleets in California, and many municipalities with NGV bus fleets, are currently under contract to receive RNG from a supplier. However, these existing contracts and fueling arrangements are at risk should this procurement provision be implemented in its current form. This procurement provision would require those same refuse and transit fleets to only procure RNG for transportation fuel as defined under the scope of the SB 1383 regulations which states:</p> <p>"Renewable Transportation Fuel means fuel derived from renewable gas from organic waste that has been diverted from a landfill and processed at an in-vessel</p>	<p>CalRecycle has revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>In order to be consistent with the organic waste diversion goals of SB 1383, the procurement requirements on jurisdictions must focus on California, landfill-diverted organic waste. As such, only eligible products defined in Section 18982(60) as “recovered organic waste products” may count towards a jurisdiction’s recovered organic waste product procurement target. If existing contracts supply jurisdictions with renewable transportation fuel that meet this definition, then a jurisdiction may count that fuel toward its procurement target. procuring recovered organic waste products made from California, landfill-diverted organic waste. The comment only refers to renewable transportation fuel, but it is important to note that a jurisdiction may procure other recovered organic waste products to fulfill the procurement requirement. CalRecycle has revised section 18993.1 to expand the list of recovered organic waste products to provide more flexibility to jurisdictions for the products they can choose to procure. If a jurisdiction already has an existing RNG contract, the procurement requirements do not require the replacement of the RNG contract. Rather, the jurisdiction may procure other eligible products such as compost or electricity. Each jurisdiction has different needs for recovered organic waste product, and the draft regulations are intended to provide jurisdictions the flexibility to choose products that fit local needs.</p>

Comment Number	Received From	Question/Comment	Response(s)
		digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste"	
2082	Campbell, Todd; Clean Energy Fuels	By limiting the scope of RNG that NGV fleets can procure, these regulations could inadvertently eliminate the competitive market for RNG. California's Low Carbon Fuel Standard has administered a fuel neutral policy that is both fuel and technology agnostic. This fuel neutrality concept has contributed to significant growth in the RNG industry in recent years and is certainly driving future growth as carbon negative RNG is coming to market. NGV fleets should be able to source RNG from all available sources, which will result in the maximum reductions in GHG and short-lived climate pollutant emissions.	A change to the regulatory text is not necessary. A text change is not necessary for the following reason(s): CalRecycle generally supports the procurement of renewable transportation fuels and the Low Carbon Fuel Program; however, in order to be consistent with the organic waste diversion goals of SB 1383, the procurement requirements on jurisdictions must focus on California, landfill-diverted organic waste. As such, only eligible products defined in Section 18982(60) as "recovered organic waste products" may count towards a jurisdiction's recovered organic waste product procurement target.
2083	Campbell, Todd; Clean Energy Fuels	Clean Energy would recommend that CalRecycle Staff re-evaluate the procurement standard of Article 12 and address the potential unintended consequences of limiting the scope of RNG that an NGV fleet can procure. All NGV fleets in California should be able to compete for RNG that yields both the highest carbon emission reduction as well as the highest economic value.	A change to the regulatory text is not necessary. A text change is not necessary for the following reason(s): CalRecycle generally supports the procurement of renewable transportation fuels and the Low Carbon Fuel Program; however, in order to be consistent with the organic waste diversion goals of SB 1383, the procurement requirements on jurisdictions must focus on California, landfill-diverted organic waste. As such, only eligible products defined in Section 18982(60) as "recovered organic waste products" may count towards a jurisdiction's recovered organic waste product procurement target.
2084	Campbell, Todd; Clean Energy Fuels	We appreciate the opportunity to provide these comments and would appreciate the opportunity to collaborate with CalRecycle Staff to address these critical issues to our Industry. We would therefore like to officially request a meeting with staff to discuss this matter in person. We also would encourage and welcome staff reaching out to us directly if staff should have any questions or would like to request any additional information.	CalRecycle appreciates the comments provided and the willingness of stakeholders to engage with CalRecycle during the rulemaking period.
4574	Carlson, J., City of Brentwood	Bioforce - We are looking at a pyrolysis sudden made by the above vendor work a similar website name that you can Google. They have this system at a water water plant on the peninsula. We are considering it for our sewer sludge and maybe food waste and possibly yard waste. They produce a bio char that can be marketed as a soil amendment. Can you check when your appropriate colleagues to give us some feedback on the many aspects of using this technology as such as permitting, meeting diversion requirements and any approvals the state has already provided the company?	This comment is outside of the scope of the proposed regulation.
2020	Carr, Bart; Recycle Smart	My comment pertains to staff's description of draft regulatory requirements for edible food recovery. Specifically, staff described reporting requirements for participating food waste generators. I find these requirements to be excessive and very difficult for local government to enforce. The presenter went quickly through the list of requirements. The two that I found most excessive was the requirement for generators to submit current contracts/agreements with the food collection service(s) they are using and to report weight of donated food items. Local government can document that generators are using collection services without the need for contracts/agreements and the food collection services themselves are best	CalRecycle would like to clarify that recordkeeping and reporting are different. Commercial edible food generators are not required to report information to the jurisdiction. They are required to maintain records, which is critical for enforcement purposes. Without the recordkeeping requirements for commercial edible food generators, jurisdictions will not be able to verify if a commercial edible food generator is complying with SB 1383's commercial edible food generator requirements. Many well-established food recovery organizations and services already provide their donors with some form of receipt of donation that often has the amount of food donated. Many organizations do this to provide their donors with information that will help the donor if they intend on claiming any of the tax incentives offered for food donation.

Comment Number	Received From	Question/Comment	Response(s)
		equipped to record and report the weight of food they collect along with the list of generators they service.	
2033	Carr, Bart; Recycle Smart	Record keeping and reporting are necessary components of measuring progress but excessive use of these activities can distract jurisdiction staff and resources from implementing and operating the actual programs that will divert organic waste. The record keeping and reporting requirements outlined in the hearing presentation is overly complex, prescriptive and will distract from our agency's ability to respond to necessary program requirements of SB1393. RecycleSmart requests that CalRecycle staff determine the very basic reporting needs to establish progress and reduce the inspection, recording, and reporting requirements of the draft regulations. Reducing the level of record keeping and reporting to sensible levels will allow local staff to focus efforts and resources on effective program implementation, management, and education & outreach.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.
2034	Carr, Bart; Recycle Smart	The draft regulation includes thirty-nine (39) violations in areas of jurisdiction compliance. The draft regulation includes an extensive list of fines ranging from \$500 to \$10,000 per day. This approach is regressive and will create an environment where jurisdictions will be more concerned with "checking the box" program implementation rather than thoughtful and selective program implementation based on local needs, staffing levels, funding, and resources. RecycleSmart requests that CalRecycle reduce the number of jurisdictional violations and the fines associated with violations. Institute a Good Faith Effort determination for those instances where a jurisdiction has attempted to respond to requirements of the regulations but not met the desired performance standard.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
6020	Chahrour, A., Citizen from El Sobrante	The regs do not adequately allow for community driven solutions to our organic waste problem. Please protect our right to compost our own waste locally in our own communities. Large scale corporate composters will play an important roll in solving this issue, but they should not be allowed to eclipse small scale solutions, or even medium scale solutions.	The terms community benefit composting and supplemental on-site compost are not used in the regulation. This comment proposes to add the definitions of 'Community Benefit Composting' and 'Micro-composting' to Article 1, thereby creating two additional categories of composting that do not reference the size and volume limitations of Section 17855(a)(4). The proposed terms for these two activities would expand the suite of activities that are not excluded from regulatory requirements. CalRecycle is not proposing amendments to the compost size thresholds in Section 17855, therefore the comment is not germane to the text CalRecycle is adopting or amending. The existing exclusion thresholds were thoroughly vetted and subject to stakeholder comment in a previous rulemaking amending those standards. No change to the regulatory text is necessary to specifically mention community composting because Section 18990.1(b) establishes that a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that would prohibit the lawful processing and recovery of organic waste. Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering

Comment Number	Received From	Question/Comment	Response(s)
			organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.
6021	Chahrour, A., Citizen from El Sobrante	Rules surrounding hauling, collecting, or size limit communit operations and are driving decentralized operations underground or out of existence.	<p>The terms community benefit composting and supplemental on-site compost are not used in the regulation.</p> <p>This comment proposes to add the definitions of ‘Community Benefit Composting’ and ‘Micro-composting’ to Article 1, thereby creating two additional categories of composting that do not reference the size and volume limitations of Section 17855(a)(4). The proposed terms for these two activities would expand the suite of activities that are not excluded from regulatory requirements. CalRecycle is not proposing amendments to the compost size thresholds in Section 17855, therefore the comment is not germane to the text CalRecycle is adopting or amending. The existing exclusion thresholds were thoroughly vetted and subject to stakeholder comment in a previous rulemaking amending those standards. No change to the regulatory text is necessary to specifically mention community composting because Section 18990.1(b) establishes that a jurisdiction shall not implement or enforce an ordinance, policy, procedure, permit condition, or initiative that includes provisions that would prohibit the lawful processing and recovery of organic waste.</p>
6022	Chahrour, A., Citizen from El Sobrante	Please consider the following advantages that community compost operations offer over large, centralized outfits like Waste Management. Community compost: 1) requires fewer miles and carbon emissions in both materials collection and compost distribution; 2) are smaller scale and therefore more controllable; 3) produce compost with less contamination, and higher nutrient density, and more microorganisms; 4) create significantly less methane and less VOCs than large scale; 5) distribute the negative impacts of air and water quality, rather than centralize these in low -income neighborhoods; 6) create localized economic benefits by keeping the jobs and fertility inour immediate communities; 7) allows the state GHG reduction funds to support people, neighborhoods, and local fertility as opposed to supporting corporate profits.	<p>Comment noted. CalRecycle acknowledges the benefits associated with community-scale composting and included provisions relative to such activities in the regulations in response to prior stakeholder comments. Jurisdiction should be aware of community composting activities. Additionally, since community composting is a method for recovering organic waste, such as food and green waste, it is worthwhile to still determine how much can be handled through these activities.</p>
6267	Chiarodit, T., County of Santa Barbara	<p>SB 1383 represents a major departure from the regulatory approach chat has already proven to be successful for ocher major environmental initiatives, AB 939 and AB 341. In chose cases, jurisdictions were given programs to implement and measurable goals co achieve. More importantly, there is latitude on the particulars of how jurisdictions meet the mandates.</p> <p>The draft approach is fundamentally different from past successful templates. The requirements are very prescriptive and punitive. Instead of seeking the lowest possible effective dosage of intrusion into local governments and the lives of their businesses and citizens, the approach represents a maximum prescriptive methodology. CalRecycle plans co hire 60 new employees just co implement the new law, which is a stark contrast from the practice whereby most municipal agencies in the state have been crying co do more with less for decades.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
6268	Chiarodit, T., County of Santa Barbara	<p>The Standardized Regulatory Impact Assessment (SRIA) is required to assess Alternative Scenarios to the proposed SB 1383 regulatory text. Both alternatives assume that all of the regulations are enacted as written, except that "Alternative 1" omits the local enforcement requirement and "Alternative 2" is stricter. Neither of these options represent a substantive departure from the draft regulations. In section 6.1.6 on page 45 of the SRIA, "Alternative 1" is rejected because it is claimed, without evidence, that "Historical precedent supports the conclusion" that without local enforcement the organic recycling goals will likely not be met. We believe enforcement does not have to be such an all-or-nothing approach. The County adopted a strategy for AB 939 and SB 341 that combined pricing incentives, requirements on our franchised haulers, and the imposition of a non-compliance surcharge on businesses as a last resort. The model works. This common sense approach to enforcement was not assessed as an alternative scenario, even though we mentioned the hybrid approach in our comments submitted in May of 2018.</p>	<p>Comment noted. The SRIA presents two alternatives. The first alternative considers implementing the regulation without requiring local governments to take enforcement against entities in violation. This assumption is not without evidence. The assumption relies on evidence from existing jurisdiction organic waste recycling programs with enforcement, compared to programs that lack enforcement.</p> <p>CalRecycle modeled the local enforcement provisions (monitoring, noticing processes, and penalties) jurisdictions must implement on the provisions included in the organic waste recycling and enforcement ordinances adopted by the City and County of San Francisco and the Alameda County Waste Management Authority. These jurisdictions enjoy the highest business compliance rates with more than 75 percent of their businesses subscribed to organic waste recycling service. Under existing law (AB 1826 (Chesbro, Chapter 727, Statutes of 2014)), certain commercial businesses are already required to subscribe to organic waste recycling services and jurisdictions are required to offer organic waste recycling to those businesses. However, that law does not currently require jurisdictions to take enforcement against businesses that fail to obtain service (the state is not authorized to take enforcement against businesses under AB 1826). The vast majority of jurisdictions have chosen not to take enforcement against any businesses that fail to have service as required by law. These jurisdictions reported that fewer than 25 percent of their businesses are in compliance with existing organic waste recycling requirements.</p> <p>The compliance rates achieved in the jurisdictions that CalRecycle modeled the delegated local enforcement provisions on represent the minimum compliance levels necessary to meet the statewide organic waste reduction targets. Compliance levels in jurisdictions that lack enforcement mechanisms reveal that failure to include mandatory jurisdiction oversight and enforcement in the regulation is incompatible with the state's ability to achieve its organic waste reduction and climate change goals.</p> <p>Comment noted. CalRecycle disagrees that the cost presented in the SRIA, and the subsequent estimates provided in the Appendix to the ISOR, "vastly underestimate the true cost of implementation." In the Appendix, CalRecycle presented a cost sensitivity of three scenarios. Each scenario is based on a projected disposal level. CalRecycle projected cost based on the most conservative projections of disposal (highest estimates of disposal and required recovery of 289 million tons). CalRecycle also provided cost sensitivity for the economic value of recycled commodities and costs for transporting recovered material to market. CalRecycle relied upon the most conservative estimates for each of these sensitivity analyses (the highest estimate of transportation costs and lowest value for recycled commodities). The general comment that CalRecycle understates costs was made by several commenters but failed to specify how costs were underestimated or recommend an alternative method for estimated costs. Regarding comments that cite specific areas where the commenter believes costs are underestimated, those comments are addressed in separate responses.</p>

Comment Number	Received From	Question/Comment	Response(s)
6269	Chiarodit, T., County of Santa Barbara	We believe the draft regulations are overly prescriptive, detailed, and punitive. Ultimately the punitive approach may alienate the partnerships between businesses, citizens and government that are needed for long-term success. Jurisdictions are directed with great specificity on how to do everything, including what colors the containers must be, how outreach and education must be conducted, how to monitor routes for contamination, saddled with many reporting requirements, and expected to adopt 11 pages of fines into local ordinances.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.
6270	Chiarodit, T., County of Santa Barbara	There are over 80 categories of fines, and each fine has 3 tiers for a total of almost 250 different types of fines. The last fine is emblematic of our overarching concern. Section 18991.5 calls for penalties of up to \$10,000 per day on a "food recovery organization ... that fails to keep records as prescribed in this section." Legislation that contemplates fining the Foodbank or Salvation Army, non-profit organizations that provide critical services to food insecure members of our community, would be problematic for our staff to endorse to the Board of Supervisors.	A change to the regulatory text is not necessary. The legislature, in SB 1383, directed CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction and authorizes penalties. The Chapter allows the flexibility to consider jurisdiction's differences and unique challenges by allowing the jurisdiction to develop and adopt their own enforceable ordinances that meet or exceed the requirements of the Chapter. The penalty ranges in section 18997.2 are consistent with Government Code sections 53069.4, 25132 and 36900 which already apply to penalties levied by jurisdictions. These set the maximum penalties that local agencies may impose. Regarding fees, SB 1383 provides broad discretion for local jurisdictions to charge and collect fees to recover its costs in complying with the regulations. These regulations do not curtail that statutory authority.
6271	Chiarodit, T., County of Santa Barbara	The County of Santa Barbara RRWMD recommends a realistic alternative that has already proven itself as a worthy model for AB 939 and AB 341, which is basically that CalRecycle sets the goals and reporting requirements, and the jurisdiction decides how to accomplish the necessary outcomes. The imposition of the proposed requirements and fines would only be required by CalRecycle only after jurisdictions are given a reasonable amount of time to achieve the stated goals.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
6272	Chiarodit, T., County of Santa Barbara	Comments on the SRIA and Statement of Reasons -- 3.3.1.1. Contamination Monitoring: "CalRecycle conducted a survey to estimate haulers' costs for contamination monitoring of organic waste loads at the point of pick up. A hauler already conducting the practice estimated that a bin check took 5 seconds, each customer had 3 bins that needed checking, there were 167,000 customers with bins, bin checks were conducted once a week, and labor cost were \$45 per hour,	The information relied upon to produce the SRIA was noted in the SRIA. The SRIA, and the subsequent Appendix to the ISOR, disclosed CalRecycle's findings regarding the estimated cost. The rulemaking record including all information relied upon for the rulemaking has been available to the public review throughout the rulemaking process. CalRecycle's announcement of comment periods disclosed this fact. The comment period for Appendix A which revised the cost estimates provided in the SRIA, importantly included the following notice:

Comment Number	Received From	Question/Comment	Response(s)
		<p>resulting in a cost of \$1.6 million per year. CalRecycle then used this cost estimate to calculate a per capita cost and extrapolate that statewide, resulting in an annual statewide cost of approximately \$78 million for contamination monitoring by organic waste haulers. The cost of reporting contamination data to jurisdictions was estimated to be 10 percent of contamination monitoring costs, or \$8 million annually."</p> <p>CalRecycle refers to a survey. The reader is only provided with information from "a hauler already conducting" monitoring. We believe the estimate of the time and money involved is systematically undersea red. The hauler apparently has 167,000 customers with 3 bins each. The reader is not told if these are residential or business customers. The term bins is normally used to connote commercial containers but the fact that there are 167,000 of these customers implies chat the routes are residential.</p>	<p>"This Appendix, as well as the entire rulemaking file, including technical documents and all information that provides the basis for the proposed regulation, are available for inspection and copying throughout the rulemaking process.</p> <p>The full text of the regulation (posted October 2, 2019) upon which the cost assessment is based on and the Appendix to the Initial Statement of Reasons are available here: <a href="https://www.calrecycle.ca.gov/Laws/Rulemaking/SLCP/">https://www.calrecycle.ca.gov/Laws/Rulemaking/SLCP/</a></p> <p>It can also be reviewed in person, along with all documents in the rulemaking file including technical documents and all information that provides the basis for the proposed regulation, from 8:00 a.m. and 4:00 p.m. at CalRecycle’s offices at 1001 I Street in Sacramento. Please contact Ashlee Yee at the above-mentioned address if you would like to schedule review of the document in person."</p>
6273	Chiarodit, T., County of Santa Barbara	<p>Comments on the SRIA and Statement of Reasons -- 3.3.1.1. Contamination Monitoring: Container monitoring does not take just 5 seconds. Carts are not aquariums where the contents easily reveal themselves. Bags and materials usually need to be moved and even opened to accurately measure the contents and contamination. Also, the only driver who can check all 3 containers is che first one there on the pickup day, assuming all carts are dumped on the same day. Finally, in order to be useful, the information has co be entered or recorded in some fashion and make its way back to the office. Each of these seeps takes time.</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews.</p> <p>These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p>

Comment Number	Received From	Question/Comment	Response(s)
6274	Chiarodit, T., County of Santa Barbara	Comments on the SRIA and Statement of Reasons -- 3.3.1.1. Contamination Monitoring: Lasclly, a driver and a truck cannot operate for \$45 per hour in California. In our community the figure for a truck and driver is closer to \$120 per hour, which is che figure that CalRecycle uses for their own staff cost estimates. The extrapolation to \$78 million in annual costs is vastly understated.	<p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p> <p>As noted in the SRIA, CalRecycle derived this information from a survey with a hauler currently performing contamination monitoring services. The costs for fuel and collection are included in the cost estimates that were provided in Table 3 in the SRIA, and updated in Tables 7 and 8 in Appendix A.</p> <p>The commenter points out that wages in their region (Santa Barbara) are much higher. CalRecycle acknowledges that wages in some regions may be higher, just as wages in other regions will be lower. CalRecycle notes that according to the Bureau of Labor Statistics (BLS) the median hourly wage for refuse and material collectors is \$17.92 per hour. The 90th percentile wage is \$31.74 per hour. BLS further identifies California’s hourly mean wage as \$25.83. CalRecycle’s estimates are reasonable and more conservative than the BLS averages for the state. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6275	Chiarodit, T., County of Santa Barbara	Comments on the SRIA and Statement of Reasons -- 3.3.2. Estimated Impacts for Solid Waste Facilities: "Solid waste facilities and stakeholders were surveyed to obtain estimates on the amount of time needed to conduct various tasks including tracking and compiling data, submitting reports, and receiving training. The amount of time needed for each task was then multiplied by the average estimated hourly wage obtained through surveys (\$30.33/hour)."	Comment noted. For the costs associated with direct requirements placed on local governments (e.g. hours associated enforcement, and oversight), CalRecycle relied upon the hourly rate for CalRecycle’s Solid Waste Enforcement staff for FY 17/18, which is \$120 per hour. The \$30.33 per hour figure was used for waste industry staff and was not used to estimate wages for local government employees. Regarding wages for waste industry staff duties see response to Economic Analysis_2

Comment Number	Received From	Question/Comment	Response(s)
		We believe the \$30.33 per hour figure is low and clearly does not include the benefits and overhead that are necessary to pay employees of local governments.	
6276	Chiarodit, T., County of Santa Barbara	<p>Comments on the SRIA and Statement of Reasons -- 3.3.4.4. Enforcement: " .... CalRecycle estimates that 320,000 businesses would be subject to inspection by Jurisdictions. Based on information from other enforcement programs (such as tire enforcement) about the number of hours per inspection, CalRecycle then estimated that it would require approximately 700,000 city/county staff hours to perform enforcement activities on these businesses."</p> <p>More backup for these assumptions on the number of businesses and hours of staff time that needs to be spent per business should be provided. Our experience is that businesses require a lot more inspection and handholding than the assumption of a little more than an hour per year. Kitchen staff needs to be trained, educational materials distributed, and the appropriate level of service must be determined and often adjusted over time. Also, even those businesses that do not participate in food collection still require staff time in order to determine their status as it relates to the regulations.</p>	<p>As noted in the SRIA, CalRecycle derived this information from a survey with a hauler currently performing contamination monitoring services. The costs for fuel and collection are included in the cost estimates that were provided in Table 3 in the SRIA, and updated in Tables 7 and 8 in Appendix A.</p> <p>The commenter points out that wages in their region (Santa Barbara) are much higher. CalRecycle acknowledges that wages in some regions may be higher, just as wages in other regions will be lower. CalRecycle notes that according to the Bureau of Labor Statistics (BLS) the median hourly wage for refuse and material collectors is \$17.92 per hour. The 90th percentile wage is \$31.74 per hour. BLS further identifies California's hourly mean wage as \$25.83. CalRecycle's estimates are reasonable and more conservative than the BLS averages for the state.</p>
6277	Chiarodit, T., County of Santa Barbara	<p>Comments on the SRIA and Statement of Reasons --4. 4.4.3.4. Impact of Transportation</p> <p>CalRecycle assumes Vehicle Miles Traveled (VMT) under the proposed regulations will be equal to "business as usual" without the regulation ... "The rationale for this assumption is based on several considerations ..... the number and frequency of heavy vehicle or truck trips to existing landfills, through neighboring communities, could even potentially be reduced ... "</p> <p>This conclusion that VMT are likely to not increase or may even be reduced is not borne out by the experience of any haulers we are aware of who have added extensive organics collection programs. There is no reason for speculation - the pertinent data should be available from haulers that would show the "before organics" and "after organics" differences between the total number of trucks, their VMT or Engine Operating Hours (EOH), fuel use, and the number of drivers. In our experience these metrics will indicate that all of these metrics increase with the addition of organics collection.</p> <p>There was some speculation in the SRIA that businesses could offset the extra VMT and other costs associated with the addition of organics collection by reducing trash service. Again, this is a theory that can be compared to hauler records before and after the initiation of organics collection efforts. In the case of businesses, it should be noted that small carts are often provided for food collection, while their trash is often in the form of large bins. The ability of a customer to offset the extra costs and transportation related to recycling food scraps, which are dense and compact, is not easy. It is not the same as offsetting commercial recycling, which is not generally dense, by decreasing trash service. In an overall sense we believe there will be more containers, trucks, VMT and costs to implement SB 1383 than are being projected in the SRIA.</p>	<p>The SRIA and the Appendix to the ISOR note that a specific increase or decrease in Vehicle Miles Traveled (VMT) could not be projected. This assessment remains true today, as noted in the Final Program Environmental Impact Report for SB 1383 Regulations—Short-Lived Climate Pollutants: Organic Waste Methane Emission Reduction:</p> <p>"Decisions by project proponents regarding the choice of compliance options and the precise location of new or modified facilities related to implementation of the proposed regulation cannot be known at this time. Furthermore, due to local planning, political (i.e., the willingness of jurisdictions to address local opposition to the siting of new or expanded facilities), and economic influences, attempting to predict project approvals about the specific location and design of facilities and operations undertaken in response to the proposed regulation would be speculative and infeasible at this stage..."</p> <p>The commenter assumes that absent an explicit calculation of VMTs, CalRecycle has failed to account for potential fuel costs associated with hauling organic material. This assumption is inaccurate. CalRecycle notes that the projected collection costs disclosed in Table 3 of the SRIA, and in Tables 7 and 8 of Appendix to the ISOR, include increased fuel costs associated with recycling.</p> <p>While this is not a direction calculation of VMT this cost does account for the costs associated with increased fuel purchases associated with increased hauling. Additionally, CalRecycle provided a cost sensitivity analysis in the Appendix to the ISOR which estimates a range of transportation costs (including fuel costs). A sensitivity analysis is provided as specific estimates of VMT would be speculative. In the Appendix to the ISOR CalRecycle notes:</p> <p>The collection costs calculated in the original SRIA, and shown in the following Collection and Processing of Organic Waste section, relied upon values derived from Cost Study on Commercial Recycling prepared by HF&amp;H Consulting and Cascadia Consulting Group for CalRecycle. The values in the cost study included fuel costs associated with collecting organic waste as a part of the total cost of collection. In this analysis,</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>CalRecycle has additionally included data available from the cost study to project a range of potential costs associated with transporting finished products (e.g. compost, recycled paper, etc.) to market.</p> <p>While fuel costs were included in the original SRIA, this analysis shows a range of additional potential cost scenarios.</p> <p>The Cost Study on Commercial Recycling provides a statewide weighted average cost per ton for transporting a range of recovered commodities to market. The transportation costs represent the cost of delivering finished product to market. (As noted above, the fuel and transportation costs associated with collection are a part of the collection line-item shown in Collection and Processing of Organic Waste). For each material category, the per ton transportation costs include 1) base costs, 2) fuel costs, and 3) hauling costs.</p> <p>Base costs are defined as the minimum charge for picking up the materials from the processing facility. This represents the cost of loading, unloading, queuing, and a minimum travel distance of 10 miles. The fuel and hauling cost components represent the additional cost per ton per mile beyond the minimum charge. The calculator includes per ton costs for various material categories (e.g. compostables, glass, wood waste, etc.). The transportation costs were applied to the projected tons that would be recovered in each category. The Cost Study on Commercial Recycling, and the O&amp;M costs for compost and AD derived from the SLCP economic assessment, include several similar or duplicative costs associated with collecting material from a facility. This was controlled for in the following low and medium transportation costs summaries. For each sensitivity analysis for transportation costs, slight variations were made to the calculator." (emphasis added).</p>
6278	Chiarodit, T., County of Santa Barbara	<p>5. Comment of Statement of Reasons "Subdivision (a)(28) "The purpose of this section is to define "gray container." This section specifies that for the purposes of this chapter a gray container is a container where the lid is entirely gray or black in color. In order to standardize container colors, which will help increase the recovery of organic waste, the regulations require organic waste collection services provided by jurisdictions to conform to specified color schemes by 2032." The claim that standardizing container colors will increase diversion is not documented, and the idea that even the trash container needs a uniform color scheme statewide is speculative. Our county is fine with the color scheme for all materials except trash. Should we have to change the trash carts there will be costs for replacement that are not insignificant. The rigid plastic is not recyclable at this time, so waste will be created. Given that there is no evidence that the color of the trash cart will increase diversion, the net impact will be to decrease diversion by forcing the "early retirement" of rigid plastic that is not currently recyclable. In addition to increasing trash disposal, the biggest impact will be the negative perception throughout the community that big government is imposing its will on our local citizenry without due cause.</p>	<p>Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container.</p>

Comment Number	Received From	Question/Comment	Response(s)
6381	Chiarodit, T., Santa Barbara	The draft regulations contain 11 pages of fines that local jurisdictions are expected to codify. Since each fine has 3 levels of severity, there are nearly 250 new penalties associated with SB 1383. What is the closest template or model that exists for enforcement on a local level for this wide range of punitive measures? We were told that the state's Waste Tire penalties, and ordinances from Alameda County and San Francisco informed the draft penalty section, but really the magnitude of fines seems without precedent. Are we missing something?	CalRecycle has revised section 18997.2 in response to this comment. The penalty table for penalties imposed by the jurisdiction has been removed. A jurisdiction shall impose penalties for violations consistent with the graduated penalty amounts authorized in Sections 53069.4, 25132 and 36900 of the Government Code which is outlined in Section 18997.2(a).
6382	Chiarodit, T., Santa Barbara	A recent speaker questioned the methane measurements science and was told that it was not relevant since SB 1383 dictates the reduction of food and organics in the landfill. Agreed. However, the methane measurements are very important when it comes to writing an Informed Regulatory Impact Assessment, which assumes certain benefits based on projected methane emission reduction. The methane measurements are also relevant to the EIR, and to an overall cost-benefit analysis of the proposed legislation.	Comment noted. Comments regarding the EIR are more appropriate for the CEQA process.
4021	Clark, M LA County Solid Waste Mgt Committee	the Task Force is very concerned about the approach that CalRecycle has selected, which places a tremendous burden and responsibility on counties and cities (more than any other stakeholder group, including, but not limited to, state agencies, public and private colleges and universities, school districts, local education agencies and non-local entities as defined in Article 1, Section 18982 (a) (40) and (42), respectively, etc.), while relying on extremely prescriptive requirements, excessive "bean counting" and reporting, and requiring counties and cities to impose steep penalties on residents and businesses.State law, Section 40001(a) of the Public Resources Code (PRC), declares that "the responsibility for solid waste management is a shared responsibility between the state and local governments (emphasis added)." Furthermore, SB 1383 recognizes the shared responsibility "the waste sector, state government, and local governments" have in achieving the organic waste reduction goals for 2020 and 2025, and thus requires CalRecycle to analyze the progress made by the three sectors, in that order, including "commitment of state funding", in achieving the said goals {PRC Section 42653. (a)} (emphasis added). However, under the proposed regulations, the responsibility weighs much more heavily on counties and cities, including programmatic and penalty requirements, than on state agencies, school districts, and special districts, local education agencies, and non-local entities (as an example, see provisions of Articles 14 and 15 of the proposed regulations). For example, SB 1383 notes that the California Constitution requires the state to "reimburse local agencies and school districts for certain costs mandated by the state (see SB 1383, preamble). SB 1383, Section 7 further states that "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act..." While both local agencies and school districts	Comment noted. The commenter is expressing an opinion on the overall scope and model of the regulations. CalRecycle has determined the regulatory model used is necessary to achieve the ambitious organic waste diversion goals in the statute that were mandated by the Legislature.

Comment Number	Received From	Question/Comment	Response(s)
		<p>may have authority to levy service charges, fees, or assessments, the proposed regulations disproportionately place the responsibility on counties and cities, even though they may encounter as much difficulty in raising charges, fees, or assessments as school districts. State agencies similarly are held to a much lower standard than counties and cities, while not being subject to a measurable penalty. Therefore, the Task Force strongly recommends the proposed regulations be revised to provide for a more equitable distribution of the responsibility for achieving the disposal reduction goals among all sectors, including industry, state government, school districts, public and private</p>	
4022	Clark, M LA County Solid Waste Mgt Committee	<p>jurisdictions to impose civil (monetary) penalties on residential or commercial organic waste generators for non-compliance.</p> <p>The proposed regulations (Article 16, Section 18997.1) require jurisdictions to “adopt ordinance(s) or enforceable mechanisms to impose penalties that are equivalent or stricter than those amounts in Section 18997.2...” (emphasis added). In addition, Section 18997.2. Penalty Amounts, requires: “(a) A jurisdiction shall impose penalties that are equivalent or stricter than those amounts in Table 1 of this section and shall be calculated by determining the type of violations that have occurred, the number of violations that have occurred, and the corresponding penalty level in subsection (b).” (emphasis added).</p> <p>While SB 1383 grants CalRecycle the authority to “require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction,” this authority does not extend to the imposition of penalties (emphasis added). SB 1383 only provides that CalRecycle “may authorize local jurisdictions to impose penalties on generators for noncompliance” {see Section 42652.5. (a)(1) of the Public Resources Code (PRC)} (emphasis added).</p> <p>In requiring counties and cities to impose steep civil penalties (\$500 per day per violation) on residents and businesses for non-compliance with each requirement of the regulations, CalRecycle would exceed its authority under the law. Such authority is vested on local governmental agencies by PRC Section 40059, which states that, “each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern, including, but not limited to, frequency of collection, means of collection and transportation, level of services, charges and fees, and nature, location, and extent of providing solid waste handling services.” (emphasis added).</p> <p>Therefore, the Task Force strongly recommends the proposed regulations be revised to delete any and all provisions that require counties and cities to impose civil (monetary) penalties on their residents or businesses. The language may be revised pursuant to PRC Section 42652.5 (a)(1) to authorize counties and cities to do so, as they deem appropriate (emphasis added).</p>	<p>The statute authorizes CalRecycle to include jurisdictional penalties on generators as part of the rulemaking and enforcement is necessary to accomplish the goals of the statute to achieve the organic waste diversion targets. Regarding Public Resources Code Section 40059, there are two phrases that must be taken into account in its application to SB 1383.</p> <p>First, Public Resources Code Section 40059 applies to aspects of solid waste handling “which are of local concern.” The organic waste diversion mandates in SB 1383 are of statewide application and statewide concern. As described in other responses to comments, CalRecycle was granted broad statutory authority by the Legislature to create rules designed to implement these statewide mandates and ensure the statutory organic waste diversion requirements are met. To the extent there are provisions in the rulemaking that touch on aspects of local solid waste handling, these are regarding matters of statewide concern that have been determined by CalRecycle to be necessary to achieve the goals of SB 1383.</p> <p>Second, Public Resources Code Section 40059 contains the introductory phrase, “Notwithstanding any other provision of law, each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern...” This phrase contemplates that other laws exist that may affect local solid waste handling and that the mere existence of those laws does not automatically preempt local governments from regulating the enumerated subject areas. It was designed to make clear that the state was not preempting the entire field of solid waste handling and that local jurisdictions were still allowed to regulate in certain areas.</p> <p>As such, Public Resources Code 40059 is not a limitation on CalRecycle from regulating aspects of solid waste handling to the extent they are of statewide concern.</p>
4023	Clark, M LA County Solid Waste Mgt Committee	<p>SB 1383 does not preclude CalRecycle from considering county or city “good faith efforts” to comply with the regulations.</p>	<p>The "good faith effort" compliance standard was specifically removed from the SB 1383 bill when it moved through the Legislative process, indicating a legislative intent that this compliance standard was not to be used.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>CalRecycle’s Statutory Background and Primary Regulatory Policies document states, in part, that “Legislative guidance directs CalRecycle not to...utilize the “Good Faith Effort” compliance model specified in PRC Section 41825.” This is inaccurate and contrary to the language of SB 1383.</p> <p>Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider “good faith effort” in determining a jurisdiction’s progress in complying with the law. It states that CalRecycle “shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825...” (emphasis added).</p> <p>Since PRC Section 41825 establishes the process to determine whether a jurisdiction has made a “good faith effort” to comply with the law, it is clear that CalRecycle is required to consider “good faith effort” in making its determination of a jurisdiction’s progress. Therefore, the proposed regulations need to be revised to provide for this provision.</p>	
4024	Clark, M LA County Solid Waste Mgt Committee	<p>As proposed, the definition of “organic” is extremely broad and basically includes plastics. The inclusion of plastic does not fit into the concept of organic collection and processing. This definition should be narrowed to prevent confusion, be consistent with state law, and should not include textiles, carpets, fiber, biosolids, digestate, or sludges. Textiles, carpets, and any other new materials should not be considered “organic” material unless their greenhouse gas (GHG) potential is analyzed. See the “Specific Comments” section of this letter, Article 1, Section 18982 (a) (46), for further comments and recommendations.</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad. The statute requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>
4025	Clark, M LA County Solid Waste Mgt Committee	<p>The proposed regulations require local governments to purchase recovered/recycled organic waste products targets set by CalRecycle. While we cannot see any statutory procurement requirement within the provisions of SB 1383, the implementation of these requirements will result in substantial additional costs to local governments over and above the costs jurisdictions already anticipate to incur for complying with the extensive programmatic requirements of the proposed regulations. Therefore, the Task Force respectfully request that CalRecycle instead work to develop markets for recovered/recycled organic waste products.</p>	<p>The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in “substantial additional costs”. It should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream. Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
4026	Clark, M LA County Solid Waste Mgt Committee	Further, the additional costs that will result from complying with the proposed regulations’ procurement requirements represent an unfunded state mandate under California Constitution, Article XIII B, Section 6 (a) since the proposed regulations would impose a new program on local governments and neither the draft regulations nor the Initial Statement of Reasons identifies a state funding	<p>CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.</p> <p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, “No reimbursement is required by this act pursuant to</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>source. CalRecycle should not rely on the fee authority granted to local governments in SB 1383. Any fee that a city, a county or city and county attempts to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, sec. 1(e) (Prop. 26) as it would not meet any of the exceptions identified in that section. Further, even if a fee were to survive scrutiny under Proposition 26, it is questionable whether a jurisdiction would not have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII D, sec. 6 (Proposition 218). This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929). For these additional reasons, the Task Force requests that the proposed procurement requirements be addressed in a separate regulatory proceeding.</p>	<p>Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.” Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a “tax” under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p> <p>Regarding “substantial additional costs,” a change to the regulatory text is not necessary. The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in “substantial additional costs”.</p> <p>CalRecycle disagrees with the suggestion to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved.</p>
4027	Clark, M LA County Solid Waste Mgt Committee	<p>The Task Force strongly believes that jurisdictions and regulated agencies would like to see the proposed regulations to be less prescriptive, more flexible, and less punitive, as well as to include reasonable timeframes for compliance. At the same time CalRecycle should focus state efforts on market development, technical</p>	<p>A change to the regulatory text is not necessary. Comment Number	Received From	Question/Comment	Response(s)
		support, including efforts to investigate emerging technologies leading to the development of new facilities and products, and funding for infrastructure.	CalRecycle disagrees with the suggestion to phase-in procurement or to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved. However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022. Finally, the regulations provide delayed implementation for rural jurisdictions. Several commenters recommended that the regulations phase-in the procurement requirements from high population to low population areas. The delayed implementation for rural areas (low population areas) was added in response to this request.
4028	Clark, M LA County Solid Waste Mgt Committee	"Special Districts" should be defined in the regulations. Furthermore, the regulations should clarify whether special districts are considered "jurisdictions" or "non-local entities," since "special districts" are included in both definitions.	In response to this comment, CalRecycle defined a "special district" as having the same meaning as Section 41821.2 of the Public Resources Code. Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a "special district that provides solid waste collection services" is a jurisdiction. Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction's regulations related to solid waste. The definition of "non-local entity," lists special districts as an example of a type of entity that could be a "non-local entity" but it does not definitively state that all special districts are non-local entities. Any special district that is a "jurisdiction" and also a "non-local entity" generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3.
4029	Clark, M LA County Solid Waste Mgt Committee	The proposed definition of "Food recovery organization" as written includes temporary food facilities, as defined under Section 113842 of the Health and Safety Code. According to the Health and Safety Code (H&SC): Nonprofit charitable temporary food facilities" means either one of the following: (a) A temporary food facility, as defined in Section 113930 of the H&SC, that is conducted by a nonprofit charitable organization, as defined in Section 113841 of the H&SC. (b) An established club or organization of students that operates under the authorization of a school or other educational facility. Should these clubs and organization be included, local jurisdictions would have to: 1) Annually identify all clubs or organizations at schools and other educational facilities (which are considered non-local entities) operating within the jurisdiction	Removing "nonprofit charitable temporary food facilities" from the definition of "food recovery organization" was not necessary because these entities are a type of food recovery organization that should be recognized and also can help California achieve its 20% edible food recovery goal. However, CalRecycle recognizes that that assessing edible food recovery capacity at nonprofit charitable temporary food facilities could be onerous given that these entities include clubs or organizations of students that operate under the authorization of a school or other educational facility. To address this concern, CalRecycle revised section 18992.2. (a)(2) so that jurisdictions will not be required to assess capacity at nonprofit charitable temporary food facilities located within the county and jurisdictions within the county. This revision was necessary to help jurisdictions comply with the edible food recovery capacity planning requirements specified in Section 18992.2.

Comment Number	Received From	Question/Comment	Response(s)
		<p>and maintain these school clubs and organizations on the jurisdiction’s website and outreach materials as potential temporary food facilities for use by commercial edible food generators - pursuant with Section 18985.2 of the proposed regulations.</p> <p>2) Assess the edible food recovery of school clubs and organizations which are involved in food recovery activities - pursuant to Section 18991.2(a)(2) of the proposed regulations.</p> <p>The Task Force recommends that nonprofit charitable temporary food facilities be excluded from the requirements listed under Section 18985.2(a)(1) and Section 18991.2(a)(2) of the proposed regulations, as they do not contribute greatly to existing food recovery capacity, and it would be an undue burden to both jurisdictions and student organizations to have to comply with these regulations.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(25) “Food recovery organization” means an entity that primarily engages in the collection or receipt of edible food from edible food generators and distributes that edible food to the public for consumption, including, but not limited to:</p> <ul style="list-style-type: none"> <li>(A) A food bank as defined in Section 113783 of the Health and Safety Code;</li> <li>(B) A nonprofit charitable organization as defined in Section 113841 of the Health and Safety code; and,</li> <li><del>(C) A nonprofit charitable temporary food facility as defined in Section 113842 of the Health and Safety Code.</del></li> </ul>	<p>Regarding the comment pertaining to Section 18985.2. Edible Food Recovery Education and Outreach (a)(1). The commenter has misinterpreted the requirement to develop a list of food recovery organizations and services operating within the jurisdiction. To clarify, the requirement does not specify that the jurisdiction shall maintain a list of all food recovery organizations and services operating within the jurisdiction, just that “a list” be created, maintained on the jurisdiction’s website, and updated annually.</p> <p>It is at the discretion of the jurisdiction to determine the food recovery organizations and services that they believe should be included on the list. Please note that the list is intended to serve as a tool to help commercial edible food generators find appropriate food recovery organizations and services to establish a contract or written agreement with pursuant to Section 18991.3(b), and thereby help ensure that edible food in the jurisdiction is not disposed in landfills, but rather put to its highest and best use of helping feed people in need.</p> <p>Developing a list that includes food recovery organizations and services that have sufficient capacity and a proven track record of safely and efficiently recovering food for human consumption will help commercial edible food generators find food recovery organizations and services that are capable of safely handling and distributing recovered edible food on a routine basis.</p>
4030	Clark, M LA County Solid Waste Mgt Committee	<p>The definition of “organic waste” as specified in the proposed regulations is extremely broad and means “solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges.” This highly broad definition seems to state that organic waste includes any type of waste other than “inert waste.” It may include solid waste, medical waste, non-inert hazardous waste, etc. The scope of this proposed definition can be reduced by limiting it to “organic solid waste.” Furthermore, the definition in the regulations is inconsistent with the definition of “organic waste” in Section 42649.8(c) of the Public Resources Code (PRC), as established by Assembly Bill 1826 (2014). AB 1826 defines “organic waste” as “food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.” The intention of SB 1383 is to establish a statewide goal to reduce the landfill disposal of the types of organic waste listed under AB 1826. Therefore, the definition of organic waste in the proposed regulations should be revised to be consistent with the definition in AB 1826. Also see General Comment No. 3.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(46) <u>“Organic waste” or “organic solid waste” means solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscape and pruning waste,</u></p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p><u>organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges. food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.</u></p>	
4031	Clark, M LA County Solid Waste Mgt Committee	<p>The definition of “renewable transportation fuel” without any justifiable reason and/or scientifically supported analysis, limits it to fuel derived from renewable gas through in-vessel digestion of organic waste only. The regulations should expand the definition of “renewable transportation fuel” to include fuel derived from renewable gas from other technologies, including thermal conversion technologies such as gasification and pyrolysis, as well methane gas generated from municipal solid waste landfills since it is biogenic in origin.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (62) “Renewable transportation fuel” means fuel derived from renewable gas <del>generated from organic waste that has been diverted from a landfill, and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste,</del> <b>a biomass conversion facility that is permitted or otherwise authorized by Division 30 of the Public Resources Code to recycle organic waste, or any other process or technology that is subsequently deemed under section 18983.2 to constitute a reduction in landfill disposal.</b></li> </ul>	<p>Regarding expanding “renewable gas” to include gas from technologies such as gasification and pyrolysis, CalRecycle disagrees with this approach. These technologies are not yet in practice on a commercial scale in California and lack the necessary conversion factors to include in Article 12. For the current regulatory proposal, CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products using publicly available pathways and conversion factors.</p> <p>Regarding landfill gas, the SB 1383 mandate is to recover organic waste that would be disposed. Generating gas in municipal solid waste landfills requires disposal of organic waste in landfills; therefore, it is inconsistent with statute to incentivize or mandate activities that do not reduce landfill disposal.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p>
4032	Clark, M LA County Solid Waste Mgt Committee	<p>The term “entity,” which is referenced multiple times in the regulations, should be defined in the regulations.</p>	<p>CalRecycle did not include a definition for “entity” because it is using the term in the regulations consistent with the commonly understood dictionary definition of the word as opposed to a specialized term requiring regulatory clarification. The term “entity” is used thousands of times in various state statutes without definition for the same reason.</p> <p>Regarding commenter’s concern regarding use of the phrase “...and other entities,” this phrase appears almost exclusively in the “General Provisions” portion of the regulations at Sections 18981.1 and 18981.2 and is intended to be a catch-all term for entities that are subject to explicit regulation under this rulemaking (eg. food recovery services and organizations) that are not otherwise listed in those sections. In Section 18981.2, the phrase is further limited to other entities “subject to the jurisdiction’s authority...” This is intended to exclude certain entities like state agencies, federal facilities, special agencies and other such entities that are not subject to a local jurisdiction’s regulatory authority. See the definition of “non-local entity” in Section 18982(a)(42).</p> <p>CalRecycle agrees that any inspections are subject to Fourth Amendment requirements. CalRecycle agrees that a jurisdiction is not obligated to undertake inspections or other enforcement action against entities outside of their regulatory jurisdiction. Inspection and enforcement against a “non-local entity,” as appropriate, would be undertaken by CalRecycle</p>
4033	Clark, M LA County Solid Waste Mgt Committee	<p>The term “regional agency,” which is referenced in Sections 18981.2 (b) (2), 18987.2 (a) (1), 18992.1 (a), 18992.1 (b), 18992.2 (a), and 18992.3 (a), should be defined in the regulations.</p>	<p>Regional agencies are defined in Public Resources Code Section 40181. Per Public Resources Code Section 40100, that definition extends to regulations adopted under Division 30 of the Public Resources Code.</p>

Comment Number	Received From	Question/Comment	Response(s)
4034	Clark, M LA County Solid Waste Mgt Committee	The term non-organic waste, which is referenced in Sections 18982 (55) (A), 18984.1 (a) (1), 18984.1 (a) (2), 18984.1 (a) (3), 18984.2 (a) (2), 18984.2 (a) (3), 18984.9 (b) (1), 18986.1 (b), and 18986.2 (b), should be defined in the regulations.	Comment noted. "Non-organic" waste is implicitly anything that is not included in the definition of "organic waste" and a separate definition is unnecessary.
4035	Clark, M LA County Solid Waste Mgt Committee	<p>The definition of "jurisdiction" has been modified in the proposed regulations to include "special districts that provide solid waste handling services." No definition of solid waste handling is included in the proposed regulations; however, this phrase is defined in two sections of the Public Resources Code, (1) Section 40195 "the collection, transportation, storage, transfer, or processing of solid wastes", and (2) Section 49505 "the collection, transportation, storage, transfer, or processing of solid waste for residential, commercial, institutional, or industrial users or customers." This has created a problem in that some special districts provide some of those services but not all of them. Therefore, the Task Force requests that the proposed regulations be modified to only apply the requirements intended for a "jurisdiction" (as defined in the PRC Section 40145). As such the proposed change in the definition of jurisdiction is overly broad and should be narrowed to be consistent with the Public Resources Code definition of "jurisdiction" contained in Section 40145. In general, the Task Force recommends that CalRecycle keeps the definitions consistent with those in the Public Resources Code.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  (36) "Jurisdiction" means a city, or county or a city and county <del>or a special district that provides solid waste handling services.</del> A city, county or county and city may utilize a Joint Powers Authority to comply with the requirements of this chapter, except that the individual city, county, or city and county shall remain ultimately responsible for compliance.</li> </ul>	Thank you for the comment. CalRecycle revised the definition of 'jurisdiction' in Section 18982(a)(36) because the original term "handling" as used in the definition is overly broad. This change is necessary to provide clarity.
4036	Clark, M LA County Solid Waste Mgt Committee	<p>In addition to anaerobic digestion and composting, biosolids can also be processed through gasification. Biosolids that are gasified produce biochar, an organic soil amendment. The Task Force recommends that CalRecycle include the land application of biochar produced from biosolids as a reduction of landfill disposal. The California Energy Commission's 2017 Integrated Energy Policy Report (2017 IEPR), published on April 16, 2018, states that the gasification of biosolids to produce biochar is a revenue source to promote the development of renewable natural gas (RNG) projects, which will be needed if jurisdictions are to meet the requirements to procure RNG transportation fuel per Section 18993.1(f)(2) of the proposed regulations.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  (b) (6) Land application, as defined in Section 17852(a)(24.5), of this division subject to the following conditions:  (A) Green waste or green material shall meet the definition of Section 17852(a)(21) and shall have been processed at a solid waste facility, as defined by Section 40194 of the Public Resources Code.  (B) Biosolids shall:</li> </ul>	<p>CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO<sub>2</sub>e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383.</p> <p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste.</p> <p>Please refer to Section 18983.2 for more information.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>1. Have undergone <del>anaerobic digestion or composting</del>, <b>any of the pathogen treatment processes</b> as defined in Part 503, Title 40 of the Code of Federal Regulations, Appendix B, <b>or gasification, as defined in Section 40117 of the Public Resources Code, to produce biochar, as defined in Section 14513.5 of the Food and Agriculture Code</b>, and,</p> <p>2. Meet the requirements in Section 17852(a)(24.5)(B)(6) of this division for beneficial reuse of biosolids.</p> <p>(C) Digestate shall:</p> <p>1. Have been anaerobically digested at an in-vessel digestion operation or facility, as described in 14 CCR sections 17896.8 through 17896.13; and, 2. Meet the land application requirements described in 14 CCR Section 17852(a)(24.5)(A).</p> <p>3. Have obtained applicable approvals from the State and/or Regional Water Quality Control Board requirements.</p>	
4037	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s):            SB 1383, Section 42652 of the PRC reads as follows: “The Legislature finds and declares all of the following:            “(a) The organic waste disposal reduction targets are essential to achieving the statewide recycling goal identified in Section 41780.01.            (b) Achieving organic waste disposal reduction targets require significant investment to develop organics recycling capacity.            (c) More robust state and local funding mechanisms are needed to support the expansion of organics recycling capacity.”            Based on the foregoing, it is clear that the Legislature and the Governor, as a part of the SB 1383 enactment, emphasized the need for development of alternative technology facilities beyond composting and anaerobic digestion technologies/facilities, upon which CalRecycle has heavily relied, while not placing sufficient emphasis on development of alternative technologies and even subjecting them to heavily restrictive standards that other methods and processes are not subjected to (such as land application). In doing so, the state has created a significant obstacle to development of facilities utilizing these technologies without a clear and scientifically substantiated justification. For example, Section 18983.2 states “To determine if the proposed operation counts as a permanent reduction in landfill disposal, the Department and/or CARB’s Executive Office shall compare the metric tons carbon dioxide equivalent (MTCO2e) per short ton organic waste reduced by the process or technology, with the emissions reduction from composting organic waste” (emphasis added). To be consistent with requirements of PRC Section 42652 and technically correct, the analysis should be made in comparison to “landfilling” and not “composting.” The Task Force would like to emphasize that the SB 1383 mandates reduction of organic waste disposal in landfills and not any other type of facilities such as those utilizing conversion technology, (emphasis added).</p>	<p>Several commenters suggested using avoided landfill emissions as the benchmark in the determination of processes or technologies that constitute a reduction in landfill disposal. Although this proposal might increase diversion of organics from landfills, it would not achieve the greenhouse gas emissions reductions required to meet the methane reduction target required by SB 1383 or the organics diversion targets specified in the Short-Lived Climate Pollutant Reduction Strategy. The benchmark value of 0.30 MTCO2e per short ton organic waste was set to ensure emission reductions for any new process or technology are comparable to the emission reductions necessary to achieve the strategy’s emission reduction goal of 4 MMTCO2e for this sector.</p>

Comment Number	Received From	Question/Comment	Response(s)
4038	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): This section does not specify obligations on the Department or the California Air Resources Board (CARB) to review the applications in a timely manner. The regulations must require the Department and CARB to make a determination in a realistic timeframe to facilitate the development of organics recycling infrastructure.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(2) The Department shall consult with CARB’s Executive Officer within 30 days of receiving the application to evaluate if the information submitted by the applicant is sufficient to determine the greenhouse gas emissions reduction potential of the proposed operation, and whether or not the proposed operation results in a permanent reduction in greenhouse gas emissions, and therefore counts as a reduction in landfill disposal. <b>The Department shall provide a response to the applicant within 90 days of receiving the application whether the information submitted by the applicant is sufficient to determine the greenhouse gas emissions reduction potential of the proposed operation and, in the response, request additional information, if needed. The Department shall make a determination whether or not the proposed operation results in a permanent reduction in greenhouse gas emissions, and therefore counts as a reduction in landfill disposal, and inform the applicant of the decision within 180 days of receiving the application.</b></p>	<p>The commenters request greater certainty as to when to expect CARB and/or CalRecycle will determine whether a proposed process or technology constitutes a reduction in landfill disposal. CalRecycle added clarification in the regulation, including that CalRecycle would let applicants know within 30 days of receipt of the application whether or not CalRecycle needs more information to process the application, and that CalRecycle will inform the applicant within 180 days after they have all needed information as to whether or not the process or technology is deemed to count as a reduction in landfill disposal. This timeline will provide applicants with a reasonable timeline for receiving determinations on proposed processes or technologies.</p>
4039	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): CalRecycle and CARB have joint authority over the verified technology determination. As the SB 1383 regulation text currently reads, either CalRecycle, CARB, or both can make this determination. The roles must be better defined to avoid delaying the technology verification process and to facilitate the development of new infrastructure.</p>	<p>CalRecycle modified the text to clarify that CalRecycle, as the entity overseeing implementation of this regulation, makes the final determination of whether a process or technology constitutes a reduction in landfill disposal. This change is needed to clarify roles.</p>
4040	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): Section 18983.2 specifies the process used to determine if operations, facilities or activities not expressly identified in the regulation shall be deemed to constitute a reduction of landfill disposal. Once this determination is made, it would be reasonable for comparable processes or technologies to be similarly deemed to constitute a reduction of landfill disposal. Section 18983.2(c) appears to provide this opportunity. The regulations must clarify if this is the intent and the section must be expanded to more specifically outline the streamlined approach that would be followed. To facilitate infrastructure development, future applicants should not be required to repeat the verification process for an already-approved process.</p>	<p>The commenter is correct. Subdivision (c) is intended to avoid duplicative effort by allowing a mechanism to show a proposed activity is identical or equivalent to a proposed activity the Department has determined pursuant to Section 18983.2(a) results in a reduction in landfill disposal.</p>
4041	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): The regulations are prescriptive in the requirements for organic waste collection services provided by the jurisdictions. Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider “good faith effort” in determining a jurisdiction’s progress in complying with the law. It states that CalRecycle “shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825...” (emphasis added). Therefore, the Task</p>	<p>A change to the regulatory text is not necessary. When the Legislature enacted the Recycling of Commercial Waste (“MCR”) law (PRC Section 41649.3(h) and (i) and the Recycling of Organic Waste (“MORe) law( PRC Section 42649.82(g) and (h) both statutes expressly required that the Department evaluate these programs using the “good faith effort” standard contained in PRC section 41825. The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>Force recommends that CalRecycle revise the regulations to incorporate provisions for jurisdictions demonstrating a “good faith effort” to comply.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) This article specifies the <del>minimum</del> <b>recommended</b> standards for organic waste collection services provided by jurisdictions, outlines efforts jurisdictions must <b>demonstrate a good faith effort</b> to engage in to reduce container contamination, delineates <b>recommended</b> container color and labeling requirements, specifies criteria for rural jurisdictions to be exempt from specified requirements of this section and criteria for jurisdictions to waive requirements for specified generators. This article additionally specifies associated recordkeeping requirements for these standards.</p>	<p>must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p> <p>Further, Making a good faith effort to achieve a unique jurisdiction target that fluctuates with annual generation is not compatible with the SB 1383 mandate to achieve a specific statewide organic waste disposal cap of 5.6 million tons on and after 2025. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>
4042	Clark, M LA County Solid Waste Mgt Committee	<p>Pursuant to SB 1383, Subdivision 45652 of the PRC, the Legislature, among other things, finds and declares that “(a) The organic waste disposal reduction targets are essential to achieving the statewide recycling goal identified in Section 41780.01.”</p> <p>The “simplest” way to measure the reduction of organic waste disposal is to quantify the tonnages of organic waste being diverted. As such, the Task Force questions the prescriptive/mandatory collection services, including the required containers and their colors, which would be mandated by the proposed regulations, are unnecessarily onerous and would impose a significant cost to counties, cities, and their residents and businesses. The Task Force strongly recommends that CalRecycle conduct and make available a detailed cost benefit analysis of the various alternative approaches to the mandatory organic waste collection service requirements considered. The Task Force also believes that said requirements are inconsistent with the state law, PRC Section 40059.</p> <p>The Task Force respectfully requests CalRecycle to address these issues in the next version of the proposed regulations.</p>	<p>Comment noted. The collection services and container labeling requirements are necessary to achieve diversion. Measurement alone will not be sufficient to move the state towards the statutory diversion targets.</p>
4043	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): The Task Force is concerned about the requirement (a)(3)(D) which states that the jurisdiction must provide the geographical areas served by the haulers, along with routes serviced, or a list of addresses served. Jurisdictions, through their franchise agreements/contracts, have committed to protecting proprietary information which may result in an economic disadvantage should the information be disclosed to haulers' competitors. The Task Force recommends order to protect the hauler’s proprietary information.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) A jurisdiction shall include the following information and documents in the Implementation Record required by Section 18995.2 of this chapter:</p> <ol style="list-style-type: none"> <li>(1) A description of which collection method(s) it will use to comply with this article.</li> </ol>	<p>The Public Records Act includes provisions to protect confidential, proprietary and/or trade secret information and the regulations includes provisions reflecting those protections. A change to the regulatory language is not necessary.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(2) The geographical area for each collection method  (3) If the jurisdiction is using a service that requires the contents of containers provided by the jurisdiction to be transported to a high diversion organic waste processing facility, the jurisdiction shall at a minimum:  (A) List all high diversion organic waste processing facilities used by the jurisdiction.  (B) Include copies of, quarterly and annual average mixed waste organic content recovery rates, for each of those facilities, as defined in Section 18984.3.  (C) List all approved haulers in the jurisdiction that are allowed to take organic waste to the jurisdiction's identified high diversion organic waste processing facility or facilities.  (D) The geographical area the hauler(s) serves, <b>or</b> the routes serviced, <del>or a list of addresses served.</del></p>	
4044	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): The regulations require jurisdictions to monitor containers and conduct route reviews as part of the container contamination minimization protocol. Furthermore, Section 18997.3 Base Table 1 lists monetary penalties for jurisdictions not implementing a container contamination minimization protocol. However, Section 17409.5.7.(c), Section 17409.5.11(b)(4), Section 17867(a)(4)(E), Section 17896.25.1(d), and Section 20901(d) state that the enforcement agency (EA) may approve an alternative frequency for load checking at a facility if the facility receives waste from jurisdictions that are monitoring containers using the container contamination minimization described in Section 18984.5. This implies that a jurisdictions' implementation of the container contamination minimization protocol is not required. CalRecycle should clarify in the regulations whether jurisdictions are required to implement a container contamination minimization protocol.</p>	<p>Section 18984.5 specifies that jurisdictions must conduct container contamination minimization and provides two options. Also, in Article 17 it specifies that jurisdictions must conduct container contamination minimization as prescribed in Section 18984.5(c) when a jurisdiction is implementing a performance-based system.</p>
4045	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): This section indicates that if a jurisdiction is utilizing a two or three-container collection system, all collection routes must be reviewed quarterly for prohibited container contaminants. Due to the size of a jurisdiction, such as the County of Los Angeles geographical jurisdiction and the number of routes presently served, this presents an incredible burden on the jurisdiction's labor and financial resources. The Task Force recommends reducing the monitoring frequency requirement to something that jurisdictions may more realistically meet. The Task Force recommends shifting this requirement to not less than annually with statistically representative sampling. The Task Force believes similar results can be derived if certain routes are sampled by specific geographic regions (such as community) or population density.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) A jurisdiction shall conduct a route review for prohibited container contaminants on randomly selected containers in a manner that results in all collection routes being reviewed <del>quarterly</del> <b>annually</b>.</p>	<p>Thank you for the comment. CalRecycle made the proposed changes, including changing from quarterly to annually. Also, jurisdictions may set what the routes are and the number of random containers to select, which is the least costly and burdensome approach. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4046	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): The Task Force recommends that this section be revised to specify that residential property owners do not have to arrange for access to individual residential unit, but only to common areas where solid waste and recycling containers are stored or may be stored. Inspectors cannot enter a private property without a Court order. However, inspections of residential containers can be made once the containers are placed in the designated area for collection.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(c) Property and business owners shall provide or arrange for access to their properties, <b>excluding the interior of each residential unit within the property</b>, during all inspections conducted pursuant to Article 14 of this chapter (commencing with Section 18995). <b>Residential containers can be inspected if they are placed in the designated area for collection.</b></p>	<p>CalRecycle revised Section 18984.10(c) in response to this comment to specify that residential property owners do not have to arrange for access to individual residential unit.</p>
4047	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s):</p> <p>This section does not recognize the good faith efforts of a jurisdiction to comply with the provisions of this chapter but that is unable to fully comply due to circumstances beyond its control. Provisions need to be provided for good faith efforts.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(d) The Department may grant waivers and/or extensions to any generator, hauler, or jurisdiction that has made good faith efforts to comply with the requirements of this article but has been unable to identify a facility with sufficient capacity to process the materials.</b></p>	<p>Section 18996.2 includes all circumstances outside of a jurisdiction's control, including the inability to identify a facility with sufficient capacity to process the materials. The regulations require a jurisdiction to demonstrate that extenuating circumstances exist and that it has made a "substantial effort" which means that it has taken all practicable actions to comply.</p>
4048	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): Chapter 3.1, Article 3, Section 17867 and Chapter 3.2, Article 3, Section 17867 of the proposed regulations state that material subject to a quarantine on movement issued by a county agricultural commissioner is considered incompatible material rather than organic waste. The regulations should clarify whether quarantined green waste will be exempt from the landfill disposal reduction requirements for organic waste. If quarantined green waste is required to be disposed in landfill for public health and safety reasons, the regulations should clarify that the disposed tonnage will not count against the 50 percent and 75 percent landfill disposal reduction targets.</p>	<p>Thank you for the comment. A change is not necessary because this was added in previously.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>In addition, CalRecycle should grant a waiver or exemption for material subject to a quarantine on movement issued by a county agricultural commissioner. Once this quarantined material is collected, it could be transferred to a facility outside of the quarantined zone contaminating other non-quarantined organic waste and spread disease, pests, or harmful bacteria or microorganisms. Additionally, the regulations should also provide a definition for “quarantined material.”</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><del>(d)</del> <b>(e) Quarantined Material</b></p> <p><b>(1) The Department shall grant an exemption for organic waste collection, as specified in this chapter, for material subject to a quarantine on movement issued by a county agricultural commissioner. A jurisdiction may dispose of organic material if it is subject to a quarantine on movement issued by a county agricultural commissioner.</b></p>	
4049	Clark, M LA County Solid Waste Mgt Committee	<p>Please clarify if the definition of “organic waste” that is required to be separated either at the source or at a high-diversion materials recovery facility and diverted from landfill includes organic waste collected from routine non-emergency debris and catch basin cleanouts. The Task Force recommends that organic waste collected from debris and catch basin cleanouts be excluded from the diversion requirements. Because this organic waste accumulates in the stormwater system and is not disposed by any particular generator in a container, it is likely to contain significant contamination and is difficult to separate from other waste and recycle. The Task Force recommends adding a waiver to the regulations addressing organic waste collected from routine cleanouts of debris basins, catch basins, and other stormwater infrastructure.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(d) Stormwater Infrastructure Exemptions:</b></p> <p><del>(1)</del> <b>The Department shall grant waivers for organic waste collected from routine clean-outs of catch basins, debris basins, and other stormwater infrastructure. A local jurisdiction or private contractor may apply to the Department for a general waiver to exempt the organic waste collected from stormwater infrastructures.</b></p> <p><del>(d-e)</del> Nothing in this section exempts a jurisdiction from complying with the other requirements to promote and provide information to generators about, waste prevention, community composting, managing organic waste on-site, and other means of recovering organic waste, or any other requirements of this chapter.</p>	This situation is already covered in Section 18984.13(b)(3). This section allows for disposal of sediment debris removed from dams, culverts, reservoirs, channels and other flood control infrastructure.
4050	Clark, M LA County Solid Waste Mgt Committee	<p>This section does not address compliance requirements for those cases for which “State of Emergency” as proclaimed by the Governor and defined by the California Code of Regulations, Title 14, Section 17210.1 (k).</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(b) (3) In a case of a “State of Emergency” as proclaimed by the Governor and defined in Section 17210.1 (k) of this division, the Department shall grant a waiver to a jurisdiction(s) from complying with the requirements of this article.</b></p>	<p>Section 19894.13(b)(1) specifically references Sections 17210.4 (Granting An Emergency Waiver) and 17210.9 (Executive Director’s Powers and Duties Relative to the Emergency Waiver) and addresses situations where the governor has declared a state of emergency as defined in Section 17210.1(k).</p> <p>A change in the regulatory text to not count disaster debris as jurisdictional disposal is not necessary. Again jurisdictions are subject to complying with regulatory actions, there is no jurisdictional disposal requirement for the purposes of this chapter.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p><b>Additionally, disaster debris generated from such an emergency shall not be counted as jurisdictional disposal for the purpose of measuring compliance with requirements of this chapter by the Department.</b></p>	
4051	Clark, M LA County Solid Waste Mgt Committee	<p>The Department should grant a waiver for jurisdictions demonstrating a good faith effort to comply with the regulations but are unable to do so due to factors outside of their control. Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider “good faith effort” in determining a jurisdiction’s progress in complying with the law. It states that CalRecycle “shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825...” (emphasis added).</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(c) Rural Exemptions:</p> <p>(1)The Department shall grant an exemption from complying with the organic waste collection requirements specified in this article for Rural Jurisdictions that meet the definition of a “Rural Jurisdiction” in Section 42649.8 of the Public Resources Code, if the governing body of the jurisdiction adopts a resolution that includes a finding as to the purpose of and need for the exemption.</p> <p>(2) An exemption implemented pursuant to this subdivision shall be valid until January 1, 2025, or until five years after the Department makes a determination pursuant to Section 42649.82 (a)(2)(D) that the statewide disposal of organic waste has not been reduced to 50 percent of the level of disposal during the 2014 calendar year, whichever is later.</p> <p><b>(d) Good Faith Effort Exemptions:</b></p> <p><b>(1) The Department shall grant an exemption from complying with a part of or all of the requirements of the regulations for a jurisdiction demonstrating a “good faith effort” to comply but cannot do so due to factors outside of its control.</b></p> <p><del>(d)</del> (e) Nothing in this section exempts a jurisdiction from complying with the other requirements to promote and 40 provide information to generators about, waste prevention, community composting, managing organic waste 41 on-site, and other means of recovering organic waste, or any other requirements of this chapter.</p>	<p>Section 18996.2 includes all circumstances outside of a jurisdiction’s control, including the inability to identify a facility with sufficient capacity to process the materials. The regulations require a jurisdiction to demonstrate that extenuating circumstances exist and that it has made a “substantial effort” which means that it has taken all practicable actions to comply.</p>
4052	Clark, M LA County Solid Waste Mgt Committee	<p>Since solid waste facility operators are in direct contact with self-haulers and jurisdictions currently have no way of identifying a generator who is a self-hauler, the Task Force recommends giving solid waste facility operators the defined role of providing information regarding the requirements of Section 18988.3 of this chapter to the self-haulers.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) Prior to February 1, 2022, and annually thereafter, <del>a jurisdiction</del> <b>solid waste facility operators</b> shall provide to self-haulers information regarding the requirements of Section 18988.3 of this chapter.</p>	<p>CalRecycle deleted requirements that jurisdictions specifically identify and educate self-haulers in response to this comment. Jurisdictions can meet the requirement to educate self-haulers by including information oneself-hauling in their general education and outreach material provided to all generators. CalRecycle deleted language requiring solid waste facility operators to educate self-haulers as it would be overly burdensome and is outside the scope of what EAs monitor at solid waste facilities. This change was made to provide the least burdensome approach and still achieve the required disposal reduction.</p>

Comment Number	Received From	Question/Comment	Response(s)
4053	Clark, M LA County Solid Waste Mgt Committee	<p>Los Angeles County is a very linguistically diverse county. Within the unincorporated areas alone, there are many generators that are "Limited English Speakers". The Task Force is concerned that the regulations may require jurisdictions to provide the education and outreach materials in every language spoken by generators within a given jurisdiction.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(f) If more than five percent of a jurisdiction's generators are defined as "Limited English Speaking Households," or "linguistically isolated," as defined by the U.S. Census Bureau, the jurisdiction shall provide the information required by this section in <del>a</del> <b>the most common</b> language or languages <del>that will assure the information is understood by those generators and</del> <b>may provide the information required by this section in other languages, upon request from a generator.</b></p>	<p>Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.</p>
4054	Clark, M LA County Solid Waste Mgt Committee	<p>Section 18986.1. Non-Local Entities Requirements states that "materials subject to a quarantine on movement issued by a county" shall not be deposited in organic waste containers (green) or recycling containers (blue). However, the proposal does not prohibit disposal in the gray container, leading to the ultimate transfer of these materials to solid waste facilities which would cause the spread of contamination and/or disease. This issue needs to be addressed in the next version of the proposed regulations. Furthermore, collection requirements for non-local entities should be consistent with the requirements for collection services provided by jurisdictions to other generators, including residents and businesses. The requirements for collection services provided by local jurisdictions do not make reference to restrictions on the disposal of "materials subject to a quarantine on movement by a county" in any collection container.</p>	<p>Thank you for the comment. CalRecycle amended the applicable section to state that a non-local entity's collection service shall be in compliance with the requirements in Article 3.</p>
4055	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s):</p> <p>The requirements for local education agencies are not consistent with the requirements for commercial businesses, multifamily properties, and non-local entities. Unlike the other aforementioned groups, Section 18986.2 does not include requirements for local education agencies to prohibit the placement of organic waste in containers not designated for organic waste, and to periodically inspect collection containers for and inform employees of observed contamination. The Task Force recommends that the Department create uniform requirements for all regulated entities, included local education agencies, so as to afford equal treatment.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) Local education agencies shall <b>also:</b></p> <ol style="list-style-type: none"> <li>(1) Provide containers for the collection of organic waste and non-organic recyclables in all areas where disposal containers are located. The containers provided shall conform to the requirements of the containers provided through the organic waste recovery service to which the local education agency is subscribed.</li> </ol>	<p>CalRecycle has revised Section 18986.2 to reflect that local education agencies shall prohibit their employees from placing organic waste in the incorrect container.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p><b>(2) Prohibit their employees and students from placing organic waste in containers not designated for organic waste as set forth in Section 18984.1.(a)(5) and Section 18984.2.(a)(5) of this chapter.</b></p> <p><b>(3) Periodically inspect organic waste containers for contamination and inform employees if containers are contaminated, and of the requirement to only use those containers for organic waste</b></p>	
4056	Clark, M LA County Solid Waste Mgt Committee	<p>Section 18987.2 It is unclear what conditions would render sewage sludge and biosolids not suitable for additional processing or recovery and require them to be sent for disposal. In addition, as written, the regulations seem to indicate that biosolids can only be disposed if they cannot be recovered. CalRecycle should not require all biosolids to be recovered and should not limit landfill disposal of biosolids as long as the organic waste landfill disposal reduction targets can be satisfied. Additionally, the remaining sewage sludge and biosolids sent for disposal to appropriate permitted disposal facilities should not be counted as disposal against the host jurisdictions in which the POTW and disposal facility is located.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) <b>Sewage sludge and biosolids</b> generated at a POTW shall may be:</p> <ol style="list-style-type: none"> <li>Transported <del>only</del> to a solid waste facility or operation for additional processing, composting, in-vessel digestion, or other recovery as specified in Section 20.1(b) of this Division, <b>or</b></li> <li><del>Notwithstanding subdivision (a)(1), sewage sludge and biosolids not suitable for additional processing or recovery may be s-</del> Sent for disposal to a permitted facility that can receive that sewage sludge and biosolids and has obtained the applicable approvals by the local, regional, state, and federal agencies having appropriate jurisdiction.</li> </ol> <p><b>(3) Residual sewage sludge and biosolids that are remaining after treatment at a POTW and destined for disposal are not subject to requirements of this chapter including, but not limited to, organic waste disposal reduction .</b></p>	CalRecycle has deleted Section 18987.2 in response to comments.
4057	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): As written, the regulations require self-haulers to source-separate all organic waste generated on site. Self-haulers should not be held to more stringent standards than contracted haulers and should also be allowed to take mixed waste to an approved high-diversion organic waste processing facility meeting all applicable requirements.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) Generators of organic waste may, in compliance with Section 18988.1 of this Division self-haul their own organic waste.</p> <p>(b) A generator who is a self-hauler of organic waste shall comply with the following:</p> <ol style="list-style-type: none"> <li><del>The generator shall source separate all organic waste generated on site in a manner consistent with 14 CCR Section 30.1 and 30.2 of this chapter.</del> (2)</li> </ol>	CalRecycle revised Section 18988.3 in response to this comment to clarify that self-haulers should not be held to more stringent standards than contracted haulers and should be allowed to take mixed waste to an approved high-diversion organic waste processing facility meeting all applicable requirements.

Comment Number	Received From	Question/Comment	Response(s)
		<p><del>(1)</del> The generator shall haul <del>source-separated</del> organic waste to a solid waste facility operation, activity, or property that processes or recovers <del>source-separated</del> organic waste.</p> <p><del>(3)</del><del>(2)</del> The generator shall keep a record of the amount of organic waste delivered to each solid waste facility, operation, activity, or property that processes or recovers organic waste; this record shall be subject to inspection by the jurisdiction.</p> <p>(A) The records shall include delivery receipts and weight tickets from the entity accepting the waste.</p> <p>(B) The record shall indicate the amount of material in cubic yards or tons transported by the generator to each entity.</p> <p>(C) Notwithstanding subdivision (b)(3)(A), if the material is transported to an entity that does not have scales on-site, the self-hauler is not required to record the weight of material but shall keep a record of the entities that received the organic waste.</p> <p><del>(4)</del> <del>(3)</del> A self-hauler shall annually report the following to the jurisdiction in which it is located:</p> <p>(A) The total amount of source-separated organic waste in tons that was self-hauled; and,</p> <p>(B) The location or address of each entity that accepted self-hauled waste from the generator.</p> <p><del>(5)</del> <del>(4)</del> A residential organic waste generator that self-hauls organic waste is not required to record or report the information identified in subdivision (b)(2) and (b)(3).</p>	
4058	Clark, M LA County Solid Waste Mgt Committee	<p>The Task Force is concerned about the requirement (a)(3)(A) which states that the jurisdiction must provide copies of all reports required by haulers to the Department (emphasis added). Jurisdictions, through their franchise agreements/contracts, have committed to protecting proprietary information which may result in an economic disadvantage should the information be disclosed to haulers' competitors. The Task Force recommends removing the requirement for jurisdictions to provide copies of all reports in order to protect the hauler's proprietary information.</p> <p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(a) A jurisdiction shall include all relevant documents supporting its compliance with this article in the Implementation Record required by Article 14 of this chapter. Records maintained shall include but are not limited to copies of:</p> <p>(1) Ordinances, contracts, franchise agreements, policies procedures, or programs relevant to this section.</p> <p>(2) A description of the jurisdiction's hauler program including:</p> <p>(A) Type of hauler systems the jurisdictions uses.</p>	<p>The comment refers to recordkeeping requirements for jurisdictions to retain. This information is not required to be reported publicly. To the extent that documents required to be retained in a jurisdiction's Implementation Record contains truly proprietary or trade secret information, there are existing protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow public agencies to withhold such information from public disclosure.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(B) Type and conditions of approvals per type of hauler, and criteria for approvals, denials and revocations. (C) Process for issuing, revoking, and denying written approvals.</p> <p>(D) Any requirements associated with self-hauling and back-hauling.</p> <p>(3) A record of hauler compliance with local ordinance(s) and the requirements of this article including the following information:</p> <p><del>(A) Copies of all reports required by haulers.</del></p> <p><del>(B A)</del> Copies of reports from self-hauler as required by Section 18988.3.</p> <p><del>(C B)</del> Copies of all written approvals, denials, and revocations.</p> <p>(b) All records required by this article shall include the date of action, the name of the hauler, and the type of the action taken by the jurisdiction.</p>	
4059	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s):</p> <p>The “non-local entities” and “local education agencies” do not report to local jurisdictions and, in most cases, they are not regulated by the local jurisdiction’s building officials. As such, the Department is the best entity for managing the requirements of Section 18989.1. for these generators. The Department will be responsible for tracking and ensuring compliance by non-local entities and local education agencies.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(b) Non-local entities and local education agencies are to comply with requirements of Subsections (a)(1) and (a)(2) and reporting to the Department.</b></p>	Other provisions in the regulations make clear that non-local entities and local education agencies are subject to CalRecycle oversight. No changes to the regulatory language are necessary.
4060	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s):</p> <p>Based on provisions of Subsection (c)(4), the proposed requirements of the Subsection(b)(3) contradict the decision in UNITED HAULERS ASSOCIATION, INC., ET AL V. ONEIDA-HERKIMER SOLID WASTE MANAGEMENT AUTHORITY ET AL., that prevents jurisdictions to utilize flow control.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b)(3) Limit the export <del>outside</del> of organic waste to a facility, operation, property or activity outside the jurisdiction that recovers the organic waste through a method identified in Article 2 of this chapter.</p> <p>(c)(4) Prohibit a jurisdiction from arranging through a contract or franchise for hauler <b>or a self-haul organic waste generator</b> to transport organic waste to a particular solid waste facility or operation for processing or recovery.</p>	<p>Oneida-Herkimer states that an ordinance requiring waste go to a public facility does not violate the flow control restrictions of the Commerce Clause, it does not authorize or require that municipalities be allowed to do so under the US Constitution nor does it prohibit a state from prohibiting such restrictions..</p> <p>The Integrated Waste Management Act (IWMA) explicitly promotes the free movement of material under Public Resources Code Sections 40001 and 40002 and this restriction is designed to ensure that.</p> <p>A change to the regulatory text is not necessary. United Haulers Association Inc., et al. v. Oneida-Herkimer Solid Waste Management Authority et al. states that an ordinance requiring waste go to a public facility does not violate the flow control restrictions of the Interstate Commerce Clause, does not authorize or require that municipalities be allowed to do so under the U.S. Constitution, nor does it prohibit a state from prohibiting such restrictions.</p> <p>State law explicitly promotes the free movement of material under the Integrated Waste Management Act, Public Resources Code Sections 40001 and 40002, and this restriction is designed to ensure that.</p> <p>Section 18990.1 (c) (4) simply notes that this section does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery. This section does not state what the regulations are requiring, but rather what the regulations do not do. Thus, United Haulers Association Inc., et al. v. Oneida-Herkimer Solid Waste Management Authority et al. is irrelevant.</p>

Comment Number	Received From	Question/Comment	Response(s)
			Read together, section 18990.1 (b) (3) prohibits a local ordinance that restricts flow, and section 18990.1 (c) (4) allows for contractual relationships, which does not restrict the flow of materials.
4061	Clark, M LA County Solid Waste Mgt Committee	<p>The Task Force recommends that the State specify that jurisdictions are required to provide education and monitor compliance of commercial edible food generators but that this requirement excludes certain Tier Two commercial edible food generators, namely “non-local entities” and “local education agencies”. Because non-local entities and local education agencies do not report to local jurisdictions, the Department is the best entity for managing the requirements of Section 18991.1 for these generators. The Department will be responsible for tracking waivers and exemptions for these groups and would be in the best position to education, monitor, and conduct outreach to these generators.</p> <p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(a) A jurisdiction shall implement an edible food recovery program that shall include the actions that the jurisdiction plans to take to accomplish the following:</p> <ol style="list-style-type: none"> <li>(1) Educate commercial edible food generators <b>with the exception of non-local entities and local education agencies</b> as set forth in Section 18985.2.</li> <li>(2) Increase <b>the access of</b> commercial edible food generators <del>access with the exception of non-local entities and local education agencies</del> to edible food recovery organizations and edible food recovery services.</li> <li>(3) Monitor <b>the compliance of</b> commercial edible food generators <del>compliance with the exception of non-local entities and local education agencies</del> as required in Article 14.</li> <li>(4) Increase edible food recovery capacity if the analysis required by Section 18992.1 indicates that the jurisdiction does not have sufficient capacity to meet its edible food recovery needs.</li> </ol> <p>(b) A jurisdiction may fund the actions taken to comply with this section through franchise fees, local assessments, or other funding mechanisms.</p>	<p>Although jurisdictions will not enforce non-local entities or local education agencies, jurisdictions are still required to provide non-local entities and local education agencies with edible food recovery education and outreach pursuant to Section 18991.1 (a)(1) and Section 18985.2 of the regulations. CalRecycle would also like to clarify that jurisdictions are required to increase all commercial edible food generators' access to food recovery organizations and food recovery services including local education agencies and non-local entities located within the jurisdiction. In addition, it is clear from the definition of "non-local entity" and "local education agency" that they are not subject to the control of a jurisdiction's authority; therefore, is it implicit that jurisdictions are only to enforce on those they have authority over. CalRecycle is responsible for monitoring compliance and enforcement of those entities.</p> <p>Regarding the comment about CalRecycle being responsible for tracking waivers and exemptions for these groups and would be in the best position to educate, monitor, and conduct outreach to these generators, the regulatory text does not include commercial edible food generator waivers or exemptions.</p>
4062	Clark, M LA County Solid Waste Mgt Committee	<p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(a) A jurisdiction shall include all documents supporting its compliance with Section 18991.1 in the Implementation Record required by Section 18995.2 of this chapter and shall also include at a minimum:</p> <ol style="list-style-type: none"> <li>(1) A list of commercial edible food generators <b>with the exception of non-local entities and local education agencies</b> in the jurisdiction that have arrangements with edible food recovery organizations or services. <b>Non-local entities and local education agencies are to report to the Department, as appropriate.</b></li> </ol>	<p>Section 18991.2 requires jurisdictions to include all documents supporting its compliance with Section 18991.1 in the Implementation Record. To clarify, since jurisdictions are not required to monitor the compliance of non-local entities or local education agencies, jurisdictions are therefore not required to include non-local entities or local education agencies on their list pursuant to Section 18991.2 (a)(1). However, all commercial edible food generators in the jurisdiction (that are not non-local entities or local education agencies) that have established a contract or written agreement pursuant to Section 18991.3 (b) must be included on the jurisdiction's list required in Section 18991.2 (a)(1).</p> <p>CalRecycle would also like to clarify that jurisdictions are still required to provide all tier one and tier two commercial edible food generators with education and outreach. This includes commercial edible food generators that are non-local entities and local education agencies. Therefore, the jurisdiction must identify all commercial edible food generators in the jurisdiction</p>

Comment Number	Received From	Question/Comment	Response(s)
			(including non-local entities and local education agencies) and include the number of all those commercial edible food generators on its list required in Section 18994.2 (h)(1).
4063	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s) If a large event is held at a State-owned facility, such as a state park, the regulations should clarify that it is the responsibility of the Department to ensure compliance with this Section 18991.3. and Section 18997.2. Penalty Amounts.</p>	Other provisions in the regulations make clear that non-local entities and local education agencies are subject to CalRecycle oversight. No changes to the regulatory language are necessary.
4064	Clark, M LA County Solid Waste Mgt Committee	<p>Comment(s): It should be recognized that the local task force created pursuant to Section 40950 of the Public Resource Code can be an asset to the county and the cities within the county in data collection and planning efforts listed in Section 18992.1(a).</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) "Counties in coordination with cities, <del>and</del> regional agencies located within the county, <b>and the local task force created pursuant to Section 40950 of the PRC,</b> shall:"</li> </ul>	A change in the regulatory text is not necessary because the regulations already identify local task forces as needing to be consulted.
4065	Clark, M LA County Solid Waste Mgt Committee	<p>There is major concern with jurisdictions being required to "verify" that capacity is available to them through contracts, permits, franchise or guarantees of access documentation. Considering that there is already a shortfall in organic waste management capacity statewide, it is inevitable that some jurisdictions will be without capacity. This may result in a competitive bidding war and/or implementation of flow control by some entities.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) (2) <del>The jurisdiction in which the facility is located, and all appropriate Regional, State and Federal non-local entities and local education agencies, shall</del> identify the amount in tons of <b>the existing</b> organic waste recycling infrastructure capacity <b>at each fully permitted facility</b>, which they are or intent to use, located both in the county and outside of the county, that is verifiably available to the county, <del>and</del> jurisdictions, non-local entities and local education agencies located within the county.</li> </ul> <p>(A) A county can demonstrate the capacity is verifiably available to the county or its jurisdictions through a contract, permit, franchise, or other documentation of the following:</p> <ol style="list-style-type: none"> <li><del>A guarantee of access to existing permitted or authorized capacity at a</del> <b>A binding guarantee of access and tonnage capacity to an existing and fully permitted</b> facility, activity, operation, or property that recovers organic waste.</li> <li>A guarantee of access to new or expanded capacity at a <b>fully permitted</b> facility, activity, operation, or property that recovers organic waste that will be available prior to the end of the reporting period.</li> </ol>	Thank you for the comment. CalRecycle substantially revised the relevant regulatory text at issue such that the suggested revisions are no longer relevant.

Comment Number	Received From	Question/Comment	Response(s)
4066	Clark, M LA County Solid Waste Mgt Committee	<p>Cities or regional agencies are required to respond within 120 days to a county when contacted about the amount of organic waste in tons that will be disposed by the cities. A similar requirement also needs to be imposed on non-local entities and local education agencies because most likely these entities will be using facilities/capacity within the said county. Since counties are penalized financially for failing to estimate organic waste disposed, the Task Force recommends including language within this section that ensures that counties are not liable if cities, non-local entities, local education agencies or regional agencies fail to respond within the given time frame.</p> <p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  (b) A city, non-local entity, local education agency or regional agency contacted by a county pursuant to subdivision (a) shall respond to the county’s request for the information necessary to comply with the requirements of this article within 120 days of receiving the request from the county.</p> <p><b>(1) If a city, non-local entity, local education agency or regional agency does not provide the necessary information to the County within the required timeframe, the County will not be held liable for failing to fully comply with requirements of this Article 11. <del>report on this jurisdiction’s organic waste disposal.</del></b></p>	<p>The language was revised to accommodate this request. Language stating the following was added:</p> <p>“If a jurisdiction or regional agency fails to provide the information necessary to comply with the requirements of this article within 120 days, the county is not required to include estimates for that jurisdiction in the report it submits...”</p> <p>Non-local entities and local education agencies are not required to report information to jurisdictions under this article.</p>
4067	Clark, M LA County Solid Waste Mgt Committee	<p>The regulations state that the county shall conduct community outreach regarding locations being considered for new or expanded facilities, in- or outside the county. We recommend that this responsibility be the role of the jurisdiction (host city or host county for unincorporated area) in which the new or expanded facility is being proposed, and not solely the role of the county regardless of the location of the new or expanded facility.</p> <p>In addition, the regulations state that haulers and owners of facilities, operations, and activities that recover organic waste shall respond to the jurisdiction regarding potential new or expanded capacity at their facilities; however, it does not include “existing capacity”.</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  (c) In complying with this section, the <b>county, city, and/or regional agency depending on the location of the facility or activity</b> shall:</p> <p>(1) Consult with the Enforcement Agency and the local task force created pursuant to Section 40950 of the Public Resources Code on the status of locations for new or expanded solid waste facilities including the potential capacity increase each facility may provide if approved.</p> <p>(2) Consult with haulers and owners of facilities, operations, and activities that recover organic waste including, but not limited to, compost facilities, in-vessel digestion facilities, and Publicly Owned Treatment Works to gather information on the existing capacity and potential new or expanded capacity at those facilities, operations, and activities.</p>	<p>The community outreach required in Section 18992.1(c)(3) is intended for the facilities or activities located within the county. Counties can work in coordination with cities to provide this outreach. Nothing precludes cities from providing outreach.</p>

Comment Number	Received From	Question/Comment	Response(s)
		(A) Entities contacted by a jurisdiction shall <b>respond within 60 days of receiving the request</b> to the jurisdiction regarding <b>existing and</b> potential new or expanded capacity at their facilities, operations, and activities, including information about throughput and permitted capacity necessary for planning purposes	
4068	Clark, M LA County Solid Waste Mgt Committee	<p>The regulations state that the county shall conduct community outreach regarding locations being considered for new or expanded facilities. The regulations should clarify if this outreach must be done throughout an entire city that a new or expanded facility is being considered or within a radius of a certain number of miles from the address at which the facility is being proposed.</p> <p>For example, if a facility is being considered in City A, does the outreach need to take place in all areas of City A, only or does it need to take place within an “X” mile radius of the proposed facility?</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(3) Conduct community outreach regarding locations being considered for new or expanded facilities, operations, or activities to seek feedback on the benefits and impacts that may be associated with new or expanded facilities, operations, or activities. The community outreach shall:</p> <p><b>(A) Be conducted within a X mile radius of the location of the proposed new or expanded facility.</b></p> <p><del>(A)(B)</del> Include at least one of the following forms of communication: public workshops or meetings, print noticing, and electronic noticing.</p> <p><del>(B)(C)</del> If applicable be conducted in coordination with potential solid waste facility operators that may use the location identified by the county.</p> <p><del>(C)(D)</del> Specifically include communication to disadvantaged communities that may be impacted by the development of new facilities at the locations identified by the county. If more than five percent of that community is defined as “Limited English Speaking Households,” or “linguistically isolated,” as defined by the U.S. Census Bureau, the jurisdiction shall provide the information required by this section in a language or languages that will assure that the information is understood by that community.</p>	Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.
4069	Clark, M LA County Solid Waste Mgt Committee	<p>According to SB 1383, CalRecycle, in consultation with CARB, shall adopt regulations that achieve the specified targets for reducing organic waste in landfills (i.e., a 50-percent reduction by 2020 and a 75-percent reduction by 2025). The current draft of the regulations state that a jurisdiction that lacks sufficient capacity shall “demonstrate how it will ensure there is enough new or expanded capacity to recover the organic waste currently disposed by generators within their jurisdiction by the end of the report period.” The way it is currently written, it appears that the regulations are requiring that all organic waste that is currently disposed be recovered (or planned for recovery) by the end of the report period.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul>	A change to the regulatory text is not necessary because the proposed change would entail placing a numerical limit on a jurisdiction, which is not allowed by the statute.

Comment Number	Received From	Question/Comment	Response(s)
		<p>(d) If a county determines that organic waste recycling capacity, in addition to the existing and proposed capacity identified pursuant to subsection (a), is needed within that county, the county shall notify the jurisdiction or jurisdictions that lack sufficient capacity that each jurisdiction is required to:</p> <p>(1) Submit an implementation schedule to the Department that demonstrates how it will ensure there is enough new or expanded capacity to recover <b>an amount of the organic waste that is equivalent to a 50-percent reduction in 2014 organic waste disposal levels by 2020, and a 75-percent reduction by 2025</b> currently disposed by generators within their jurisdiction by the end of the report period <b>set forth in Section 18992.3 of this article.</b></p>	
4070	Clark, M LA County Solid Waste Mgt Committee	<p>Including options that would require jurisdictions to plan for obtaining funding or provide financial support for expansion of organic waste recycling facilities would put an undue burden on jurisdictions. The Task Force recommends that this language be removed and replaced with other options including efforts by the Department and State to promote the development of new facilities.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(d)(1) Submit an implementation <del>schedule</del> <b>plan</b> to the Department that demonstrates how it will ensure there is enough new or expanded capacity to recover the organic waste currently disposed of by generators within their jurisdiction by the end of the report period.</p> <p>(A) The implementation <del>schedule</del> <b>plan</b> shall include <del>timelines and milestones for planning efforts to access</del> <b>strategies for ensuring</b> additional new or expanded capacity, including, but not limited to:</p>	The regulatory language at issue does not require funding. It requires an implementation schedule laying out milestones and timelines for planning efforts. CalRecycle is not enforcing a funding requirement.
4071	Clark, M LA County Solid Waste Mgt Committee	<p>“Identify” is spelled incorrectly.</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(d)(2) <del>Identify</del> <b>Identify</b> proposed new or expanded organic waste recycling facilities that will be used to process the organic waste identified pursuant to subsection (a)(3).</p>	Thank you for your comment, the error was corrected.
4072	Clark, M LA County Solid Waste Mgt Committee	<p>For capacity planning purposes, the regulations include “digestate and biosolids” within the organic waste material types. In the latest version of CalRecycle’s Characterization of Solid Waste in California report, these two materials are not included in the report. Since the regulations lists the waste characterization study as a means to estimate the countywide disposal, will CalRecycle provide counties with the disposal composition of these materials to assist in the capacity planning analysis? We recommend that CalRecycle provide counties with the statewide disposal composition of digestate and biosolids before the first capacity plan is due to CalRecycle on February 1, 2022.</p>	<p>CalRecycle has revised Section 18992.1(f) in response to this comment. The change adds another information source that can be used for this requirement. The change is necessary because statewide or local characterization studies typically do not characterize digestate/biosolid, as they are not a part of the commercial and residential waste stream. However, this information should be limited to using a published report or another form of data generated by the appropriate solid waste management entities within the county that provides organic waste disposal tonnages or percentages for digestate/biosolids. This data would be used in addition to either statewide or local characterization studies.</p> <p>The RDRS system will have some reporting of the disposal and other end destinations for some digestate and biosolids (if the reporting entity is over the tonnage thresholds and is not just sending it to another POTW or if they are using it onsite). Since this data will include large generators, CalRecycle will include this data in the capacity planning tool.</p>

Comment Number	Received From	Question/Comment	Response(s)
4073	Clark, M LA County Solid Waste Mgt Committee	Counties are required to “Estimate the amount of edible food that will be disposed of by commercial edible food generators . . .”. Currently, there are no tools to quantify the amount of edible food in the disposal stream. Therefore, we recommend that CalRecycle provide Counties with a methodology to estimate the amount of edible food within the disposal stream.	CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
4074	Clark, M LA County Solid Waste Mgt Committee	<p>It should be recognized the local task force created pursuant to Section 40950 of the Public Resource Code can be an asset to the county and the cities within the county in data collection and planning efforts listed in Section 18992.2 (a).</p> <p>In addition, the regulations should include a requirement on cities, regional agencies and edible food recovery organizations to respond to and provide the requested capacity data/information to Counties or other applicable jurisdictions for edible food capacity planning purposes.</p> <p>Additionally, in Section 18992.2(a)(3), counties are required to “Identify proposed new or expanded edible food recovery organizations”. Additionally, in Section 18992.2(b)(2), jurisdictions are required to “Consult with edible food recovery organizations. . . regarding existing, or proposed new and expanded capacity”. This appears to be a very repetitive requirement. We recommend that Counties be required to focus on existing edible food recovery capacity and cities (jurisdictions) be required to focus on the new or expanded edible food recovery capacity.</p> <p><b>Proposed Regulatory Text and Recommended Changes/Revisions:</b></p> <p>(a) Counties in coordination with cities, <del>and</del> regional agencies located within the county, <b>and the local task force created pursuant to Section 40950 of the PRC</b> shall:</p> <ol style="list-style-type: none"> <li>(1) Estimate the amount of edible food that will be disposed of by commercial edible food generators that are located within the county and jurisdictions within the county.</li> <li>(2) Identify existing capacity at edible food recovery organizations that is available to commercial edible food generators located within the county and jurisdictions within the county.</li> <li><del>(3) Identify proposed new or expanded edible food recovery organizations that will be used to process edible food identified pursuant to subsection (1).</del></li> <li><del>(4)</del><b>(3)</b> Identify the amount of capacity at edible food recovery organizations that is necessary to recover 20 percent of the edible food that is estimated to be disposed.</li> </ol> <p><b>(b) A city or regional agency contacted by a county pursuant to subdivision (a) shall respond to the county’s request for the information necessary to comply with the requirements of this article within 120 days of receiving the request from the county.</b></p> <p><b>(c) Food recovery organizations contacted by a jurisdiction shall respond to the jurisdiction regarding potential new or expanded food recovery capacity at their facilities, operations, and activities.</b></p>	

Comment Number	Received From	Question/Comment	Response(s)
		<del>(b)</del> (d) If a county identifies that new or expanded capacity is needed to recover the amount of edible food identified in (a)(4), then each jurisdiction(s) within that county that lacks capacity shall.	
4075	Clark, M LA County Solid Waste Mgt Committee	The Task Force recommends that this section be expanded to add a subsection including appropriate provisions for compliance by non-local entities and local education agencies a consistent with requirements of this Article 11.	A change to the regulatory text is not necessary. Article 5, Section 18986.1 and Section 18986.2 described the compliance requirements for non-local entities and local education agencies. For the purposes of these regulations, non-local entities and local education agencies are considered organic waste generators and have specific requirements to comply and are not held to the same standards as jurisdictions. Section 18996.7 does not require local jurisdictions to enforce against local education agencies. This enforcement will be conducted by the Department.
4076	Clark, M LA County Solid Waste Mgt Committee	For the purpose of this Article, the discussions and requirements need to be expanded to include appropriate provisions for compliance by non-local entities and local education agencies consistent with requirements of this article.	<p>Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor’s office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.</p>

Comment Number	Received From	Question/Comment	Response(s)
4077	Clark, M LA County Solid Waste Mgt Committee	While the Task Force recognizes the need and importance of market development, such efforts must be mandated by legislative authority with associated funding to assist local jurisdictions. The Task Force recommends that the requirement for local jurisdictions to procure recovered organic waste products be eliminated from the regulations, since this requirement is not supported by legislative authority.	<p>Procurement requirements are within CalRecycle's authority and are necessary to achieve the organic waste diversion targets in statute by ensuring end uses for processed organic waste. SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, "CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code." That section also provides that CalRecycle may "include different levels of requirements for local jurisdictions..."</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, "The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code." SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that "[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. '[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .'. The [administrative agency] is authorized to 'fill up the details' of the statutory scheme."</p> <p>Consistent with CalRecycle's broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that "state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas." As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board's Short Lived Climate Pollutant Strategy states, "CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products."</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board's SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle's 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste. Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, "A local jurisdiction may charge and collect fees to recover the local jurisdiction's costs incurred in complying with the regulations adopted pursuant to this section."</p>
4078	Clark, M LA County Solid Waste Mgt Committee	<p>In addition to compost and renewable transportation fuel, CalRecycle should add electricity generated from recycled organic waste to the list of recycled organic waste products that may be procured to meet the recovered organic waste procurement target. In-vessel digestion and biomass conversion are activities deemed to constitute a reduction in landfill disposal per Section 18983.1(b) (3) and (4) of the proposed regulations, respectively. In-vessel digestion produces biogas and biomass conversion produces syngas, both of which can be used to produce renewable natural gas (RNG) and electricity, as well as transportation fuel. CalRecycle should be promoting, rather than limiting, the use of the recycled organic waste products that may be procured to provide jurisdictions flexibility and a variety of options to meet the procurement target. Producing compost in densely-populated urban and suburban jurisdictions can be challenging due to odors, space constraints, and permitting issues. The stringent requirements for pipeline injection of RNG transportation fuel in the state will make it extremely challenging for jurisdictions to procure RNG transportation fuel from remote production facilities and will require each jurisdiction to develop several of its own RNG production and on-site fueling facilities. CalRecycle needs to be a tool rather than an obstacle in promoting development of facility using emerging technologies (such as low- and mid- temperate thermal conversion technologies) to develop products in assisting the reduction of organic waste landfill disposal.</p>	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel. CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>

The broad range of potential recovered organic waste products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors.</p>
4080	Clark, M LA County Solid Waste Mgt Committee	<p>For the purpose of this Article, include a section to stipulate appropriate provisions for compliance by non-local entities and local education agencies consistent with requirements of this article.</p>	<p>A change to the regulatory text is not necessary. 4081	Clark, M LA County Solid Waste Mgt Committee	<p>The Task Force recommends that CalRecycle clarify that the jurisdictions' reporting requirements under this Article 13 exclude non-local entities and local education agencies not receiving services through local jurisdictions' collection systems.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) Each jurisdiction shall report the following, relative to its implementation of the organic waste collection requirements of Article 3 of this chapter:</p> <ol style="list-style-type: none"> <li>The type of organic waste collection service(s) provided by the jurisdiction to its generators <b>with the exception of non-local entities and local education agencies.</b></li> <li>The total number of generators that receive each type of organic waste collection service provided by the jurisdiction <b>with the exception of non-local entities and local education agencies.</b></li> </ol>	<p>If a jurisdiction is not providing collection service to non-local entities and/or local education agencies, jurisdictions are not required to reflect those in their reporting.</p>
4082	Clark, M LA County Solid Waste Mgt Committee	<p>Requiring a jurisdiction to be responsible for all tracking and reporting of self-haulers and non-exclusive franchise haulers as stipulates in subsections (d) and (f) requires strict regulation, inspection and enforcement activities by the jurisdiction while placing significant activities on small businesses like landscapers, small community composter, etc. To reduce the impact of this costly and time-consuming requirement, the proposal should allow the information collected from affected self-haulers pursuant to AB 901, Chapter 746 of the 2015 State Statutes.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(d) Each jurisdiction shall report the following relative to its implementation of waivers pursuant to Article 3.</p> <ol style="list-style-type: none"> <li>The number of days an emergency circumstances waiver as allowed in 18984.13 was in effect and the type of waiver issued.</li> <li>The tons of organic waste that were disposed as a result of waivers identified in (1).</li> <li>The number of generators issued a de-minimis waiver.</li> <li>The number of generators issued a physical space waiver.</li> <li>A jurisdiction that receives a waiver from the Department pursuant to Section 18984.12 of Article 3 shall report the following information for each year the waiver is in effect: <ol style="list-style-type: none"> <li>The number of generators waived from the requirement to subscribe to an organic waste collection service.</li> </ol> </li> </ol> <p><b>(6) In lieu of the above, the jurisdiction and self-haulers can utilize the data collected pursuant to AB 901, Chapter 746 of the State Statute of 2015.</b></p> <p>(f) A jurisdiction shall report the following regarding its implementation of the hauler oversight requirements of Article 7.</p> <ol style="list-style-type: none"> <li>The number of haulers approved to collect organic waste in the jurisdiction.</li> <li>The Recycling and Disposal Reporting System number of each facility that is receiving organic waste from haulers approved by the jurisdiction.</li> <li>The number of haulers that have had their approval revoked or denied.</li> </ol>	<p>A change to the regulatory text is not necessary. The legislature, in SB 1383, directed CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction and authorizes penalties. The Chapter allows the flexibility to consider jurisdiction's differences and unique challenges by allowing the jurisdiction to develop and adopt their own enforceable ordinances that meet or exceed the requirements of the Chapter. The penalty ranges in section 18997.2 are consistent with Government Code sections 53069.4, 25132 and 36900 which already apply to penalties levied by jurisdictions. These set the maximum penalties that local agencies may impose. Regarding fees, SB 1383 provides broad discretion for local jurisdictions to charge and collect fees to recover its costs in complying with the regulations. These regulations do not curtail that statutory authority.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(4) The number of self-haulers approved to operate within the jurisdiction.</p> <p>(5) The total amount, in tons, of source separated organic waste that was self-hauled by organic waste generators and reported to the jurisdiction pursuant to Section 18988.3.</p> <p><b>(6) In lieu of the above, the jurisdiction and self-haulers can utilize the data collected pursuant to AB 901, Chapter 746 of the State Statute of 2015.</b></p>	
4083	Clark, M LA County Solid Waste Mgt Committee	For the purpose of this Article, include a section to stipulate appropriate provisions and identify/specify the entity that would be responsible to measure compliance {i.e. conduct inspection(s), take enforcement action(s), recordkeeping, and possible imposition of penalties} of non-local entities, including federal agencies/facilities) and local education agencies} with appropriate requirements of this Article.	A change to the regulatory text is not necessary. Article 5, Section 18986.1 and Section 18986.2 described the compliance requirements for non-local entities and local education agencies. For the purposes of these regulations, non-local entities and local education agencies are considered organic waste generators and have specific requirements to comply and are not held to the same standards as jurisdictions. Section 18996.7 does not require local jurisdictions to enforce against local education agencies. This enforcement will be conducted by the Department.
4084	Clark, M LA County Solid Waste Mgt Committee	<p>There is concern with maintaining confidentiality of some information in that in order to comply with the regulations, the jurisdiction would need to provide its customer lists to CalRecycle.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(c) A jurisdiction shall generate a written report for each inspection, route review, and compliance review conducted pursuant to this Chapter. Each report shall include, at a minimum, the following information, <b>unless such information is restricted by a confidentiality agreement or considered proprietary information:</b></p> <p>(1) Identifying information for the subject or subjects of the inspection, route review or compliance review, such as, but not limited to:</p> <p><del>(A) The name or account name of each person or entity.</del></p> <p><b>(A B) A general description of the route and addresses location</b> covered by a route review.</p> <p><del>(B C) A general description of the list of accounts reviewed for each compliance review.</del></p> <p><b>(C) A list of accounts, including addresses along with names of the account holders, determined by the jurisdiction to be subject to enforcement actions.</b></p>	The comment refers to recordkeeping requirements for jurisdictions to retain. This information is not required to be reported publicly. To the extent that documents required to be retained in a jurisdiction's Implementation Record contains truly proprietary or trade secret information, there are existing protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow public agencies to withhold such information from public disclosure.
4085	Clark, M LA County Solid Waste Mgt Committee	Pursuant § 42653 of the PRC, CalRecycle and CARB (not local jurisdictions) are responsible for identifying the barriers to organic waste recycling, the status of new organics recycling infrastructure development, the commitment of state funding to support infrastructure expansion, the progress in reducing regulatory barriers to the siting of organics recycling facilities, the timing and effectiveness of policies that will facilitate the permitting of organics recycling infrastructure, and the status of markets for the products generated by organics recycling facilities. Therefore, the Task Force recommends that the regulatory language include allowances for jurisdictions and other entities that demonstrate a substantial effort to comply with the regulations but are unable to do so due to factors outside of their control. Furthermore, the Task Force recommends that CalRecycle revise the regulations to incorporate provisions for jurisdictions demonstrating a "good faith effort" to	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction

		<p><b>(e) If an entity can demonstrate to the Department that it has made a good faith effort to comply with the requirements set forth in this chapter, but is unable to fulfill those responsibilities or obligations, due to factors outside of its control, then the Department may consider a hardship allowance for said entity.</b></p>	
4090	Clark, M LA County Solid Waste Mgt Committee	<p>Article 16 needs to be expanded to provide and discuss in detail the following:            (a) The process and the time frame that an affected organic waste generator and/or an entity could appeal the Department's decision regarding compliance with the requirements of this chapter and the agency that the appeal must be filed with. (b) What are the allowable uses of revenue generated from the collected penalties and the agency with the decision-making authority for its use?</p>	<p>There are no provisions for appeals and a challenge of a final jurisdiction or Department order/penalty would be subject to judicial review. The use of penalty revenue is subject to state or local requirements outside of SB 1383.            The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>
4091	Clark, M LA County Solid Waste Mgt Committee	<p>The monetary penalties for Property and Business Owners should not be based on established penalty severity levels. The penalties should have a maximum limit so as not to disproportionately penalize certified small businesses, non-profit organizations, or other entities for whom the penalties may cause substantial hardship.            The monetary penalties for residential organic waste generators should be given their own category in Table 1 separate from all other organic waste generators. The penalties for residential organic waste generators should not be based on established penalty severity levels. The penalties should have a maximum limit so as not to disproportionately penalize economically disadvantaged communities in the state.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) A jurisdiction shall impose penalties that are equivalent or stricter than those amounts in Table 1 of this section, <b>except in cases where these penalties may cause substantial hardship to certified small businesses, non-profit organizations, economically disadvantaged communities, or other applicable entities</b>, and shall be calculated by determining the type of violations that have occurred, the number of violations that have occurred, and the corresponding penalty level in subsection (b). Table 1 First, second and third violations be Level 0 PLEASE SEE LETTER TO VIEW THE COMMENTERS TABLE. THIS PROCESSOR WAS NOT ABLE TO INSERT IT INTO THIS COMMENT MATRIX. (b) Consistent with the requirements prescribed in Government Code Sections 53069, 25132 and 36900, the penalty severity levels are as follows:</p>	<p>A residential generator may be imposed penalties pursuant to section 18984.9(a).             CalRecycle has revised the penalty amounts in Section 18997.2 from per day violations to per violation. The penalty provisions are consistent with the existing penalty limitations in the Government Code Sections 53069.4, 25132 and 36900. Entities in violation are given ample time through the Notice of Violation process to comply and avoid penalties.            A change to the regulatory text is not necessary. The penalty fines listed in Section 18997.2 Base Table 1 are the minimum penalty thresholds imposed by a jurisdiction. The severity levels allow a jurisdiction the discretion to penalize smaller businesses at the minimum penalty and levy a more substantial penalty against larger businesses that may be contributing more to the organic waste stream. These penalties are consistent with the limitations on fine levels for local agencies in the Government Code. The penalty fines listed in section 18997.3 Base Table 1-10 are minimum penalty threshold to be imposed by the Department and are specifically contemplated in the language of SB 1383 as being up to \$10,000 per day. These penalties are reserved for the jurisdictions and for entities when the jurisdiction has failed to enforce. In most programs with a progressive enforcement process, generators or operators have ample time to comply, resulting in very few fines. For example, Section 18995.4 explains the minimum timeframe for the process of issuing a Notice of Violation to an entity if they are found non-compliant. A jurisdiction has 60 days from the date of inspection to issue a NOV. This allows time for the entity to remedy the situation before the jurisdiction has to issue a NOV. If an NOV is issued, the entity has up to 150 days to come into compliance before the jurisdiction must commence action to impose a penalty. This allows an entity up to 210 days to remedy a violation before a penalty is imposed. Additional extensions are available due to extenuating circumstances or infrastructure deficiencies.</p>

This allows an entity up to 210 days to remedy a violation before a penalty is imposed. Additional extensions are available due to extenuating circumstances or infrastructure deficiencies.</p>
4148	Clifford, G, Athens Services	<p>Primary Issue: Increase the Contamination Standard from 10% to 25% for MW MRFs Mixed Waste Material Recovery Facilities are essential to achieve the GHG targets. As I have described above, Athens is at the forefront of implementing innovative refuse and recycling technology, having opened our Sun Valley facility in 2017 at an investment of \$ 50 million to achieve and go beyond the state’s previous recycling and diversion mandates. Section 17409.8.5.8, as proposed to be amended, will render our state-of-the-art facility and other facilities in our network, largely unusable unless the percentage of 10% contamination is changed to 25%. The Sun Valley MRF took 12 years to permit, plan and build. Many existing MRFs are land restricted from expansion or limited by building footprint. Therefore the future of recycling may require MRFs “ built in series “ to accomplish recycling mandates . Some MRFs may do the “initial cut “ at recycling and other MRFs potentially could handle the “ finishing work “ . Introducing mandates of contamination levels restrict the ability to creatively address recycling mandates and imperil the investment in existing infrastructure . We urge that CalRecycle provide maximum flexibility to achieve the standards without restrictions or mandates if it can be demonstrated</p>	<p>CalRecycle has revised this section to phase in the acceptable level. The change phased in the acceptable levels of incompatible material and the acceptable levels of organic waste in the material sent to disposal from 10 percent by 2022 to 20 percent on and after 2022 and 10 percent on and after 2024. This change was necessary to allow entities time to plan and make necessary adjustments to their operations. SB 1383 establishes targets to achieve a 50 percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75 percent reduction by 2025. In order to achieve these targets, regulatory limitations for processing organic waste must be implemented.</p> <p>Section 17409.5.8 is a cleanliness standard put on organics removed from the Mixed Waste Collection Stream and Source Separated Organics Collection stream sent for recovery. In addition to meeting a 50/75% recovery for organic waste, organic waste sent to a secondary facility (compost/In-Vessel Digestion) for recovery it needs to be less than 20% of incompatible material on and after 2022 and 10% on and after 2024, otherwise, there are limitations on where this material can be sent to. Material with more than 20% of incompatible material on and after 2022 and 10% on and after 2024 must be sent to a Transfer/Processing Facility that can meet 1749.5.8 or a compost/in-vessel digestion facility that disposes of no more than 20% of organic material on</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>that companies are building MRF infrastructure that is part of an eco system that utilizes existing investments and new investments. CalRecycle’s Sec. 17409.8.5.8 proposed language is one of the key issues at the heart of the regulation’s inflexibility. Source Separated Organics “SSO” and Mixed Waste Organics “MW O MRF” collection systems are expected to obtain the same – 10% maximum residual; seemingly equal treatment under the regulation. But in fact MW MRFs are severely punished and in the end restrained from accomplishing the GHG target of 50% (by 2020) and 75% (by 2025). This impossibly low 10% ceiling, in effect, would make MW O collection systems and therefore their processing facilities obsolete without any meaningful analysis or legal authority. In fact, the Legislature was clear in granting legal authority for a “target” of “50% and 75%”, not a “mandate” on a particular type of facility. And the law did not intend in any way to require a facility to recycle 90% of organics. Further, there was no mandate placed on any individual jurisdictions. This section effectively penalizes jurisdictions utilizing a MW MRF facility.</p> <p>Furthermore, the “Initial Statement of Reasons” does not demonstrate via economic or environmental analysis the need for, or the science behind, a 10% standard of contamination to meet the GHG targets. In our reading of the “Technical, Theoretical and Empirical Study, Reports or Documents, we could not find any evidence that a 10% contamination standard is necessary or justified. If CalRecycle has such an analysis, please provide it to us for our review and comments. In fact, a 10% standard WILL MOST CERTAINLY BE at least 15% too low for a MW O MRF. We would therefore urge an amendment to allow flexibility in the standards to achieve recycling initiatives for the reasons mentioned. A flexible contamination standard in this section would greatly assist in:</p> <ul style="list-style-type: none"> <li>● Meeting the 50% and 75% GHG targets and keeping the regulations within the bounds of the legal authority given under SB 1383 of 2016;</li> <li>● Doing no harm to existing mixed waste recycling MRF facilities;</li> <li>● Preserving local jurisdictions’ AB 939 50% plus recycling rates, especially in light of the China Sword; and</li> <li>● Providing overall balance on consumer rates while achieving the statewide GHG targets</li> </ul>	<p>and after 2022 and 10% on and after 2024 in their residual waste stream. The contamination limit is to ensure that dirty material is not being sent to secondary facilities (compost/in-vessel). Meeting the incompatible limit might be burdensome to the MRF but sending dirty material to a Compost Facility or In-Vessel Digestion facility puts the burden on them to further clean that material.</p>
6344	Clough, A., City of Emeryville	Particularly concerning is the amount of time it might take to fulfill requirements for monitoring, enforcing and reporting. Currently we have 60% of a single staff person working on all waste issues at the City" of Emeryville.	A change to the regulatory text is not necessary. The reporting and recordkeeping requirements are the minimum amount needed to allow CalRecycle to ensure a jurisdictions compliance with the Chapter. The recordkeeping requirements also assist a jurisdiction in verifying and tracking their own progress and if they are complying with the law. The Chapter allows a jurisdiction the flexibility to fulfill its oversight role by adopting their own enforceable ordinances that are consistent with the requirements of the Chapter.
6345	Clough, A., City of Emeryville	Another specific comment staff would like to highlight is Section 18984.8, placement of appropriate labels on collection containers. It is stuff’s request that a	Thank you for the comment regarding the additional time, great cost savings, and easier compliance with the container color and label requirements. That comment is in support of current language.

Comment Number	Received From	Question/Comment	Response(s)
		<p>jurisdiction designee, such as the hauler, be allowed to affix container labels at the time of container delivery, as is current practice.</p>	<p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers' useful life or by 2036.</p> <p>A jurisdiction's designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>With respect to compactors owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements.</p> <p>In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to meet that statute's signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>In regards to the lid comment, a change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p> <p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>In regards to the new technology, CalRecycle is unclear on how that will help educate the generators.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>he current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state's efforts to</p>

			keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier time.
6003	Coelho, L., SCS Engineers	Question about the inclusion of building materials in the definition of organics and paper products: Is this definition suggesting the paper backing be removed from building insulation?	CalRecycle has revised Section 18982(51) in response to this comment. The changes include the deletion of “building insulation and panels” from the Paper Products definition. The change clarifies that these products are excluded from the definition and are not part of the suite of options available to a jurisdiction for purchasing recycled content and recyclable paper. While CalRecycle has made the recommended change, it should be noted that the broad range of products listed in the Paper Products definition is intended to provide more flexibility to jurisdictions in terms of the paper products eligible for purchase. However, CalRecycle recognizes that building insulation and panels would likely not meet the requirements for recyclability specified in Section 18993.3(c)(2) and therefore agrees with the proposed revision.
6004	Coelho, L., SCS Engineers	Regarding CalGreen Standards: Is the intention to allow credit for recycling the organic portion of C&D materials to count toward the reduction targets?	CalRecycle is not enforcing reduction targets on individual jurisdictions.
6035	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding this record keeping requirement - "the established frequency that food will be collected." The commentor notes that "Frequency can vary based on inventory, season, weather conditions, consumer demand, etc. As a result, we don't believe that tracking this metric would be practicable or particularly beneficial."	A frequency for the collection or self-haul of edible food must be established and documented. Maintaining a record of the established a frequency that edible food is collected or self-hauled is necessary because this information can be used to help jurisdictions determine if a commercial edible food generator is recovering the maximum amount of edible food that would otherwise be disposed. CalRecycle would like to clarify that nothing prohibits a food recovery organization or a food recovery service and a commercial edible food generator from establishing more than one frequency to account for changes in the amount of edible food available. For example, a local education agency could have one established frequency for collections during the school year, and a different established frequency during the summer months when school is not in session and there is less food to recover.
6036	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding this record keeping requirement - "An edible food generator may use an alternative metric provided by the food recovery service or organization to measure the quantity of food recovered." The commentor notes "We recommend maintaining a single metric – pounds – to avoid the confusion of multiple measures and creating the need to translate/reconcile across different metrics."	CalRecycle agrees with this comment and removed the following language from the regulatory text: “An edible food generator may use an alternative metric provided by the food recovery service or organization to measure the quantity of food recovered.” By removing this language, all commercial edible food generators will be required to track pounds of food recovered. This revision will eliminate confusion of multiple metrics, and also make commercial edible food generator recordkeeping more consistent as they will all be required to track pounds.
6037	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding "(a) A food recovery organization or service that collects or receives 6 tons or more of edible food from edible food generators per year shall maintain a record that includes all of the following:" The commentor notes: "Our perspective is that 6 tons is a relatively low threshold; as such, it might be better (for consistency) to eliminate the threshold and track for all food generators. This could be particularly relevant in context of tracing food-borne illness"	While some commenters requested that the threshold be increased from 6 tons to 12 tons, other stakeholders recommended removing the threshold completely so that any food recovery organization or food recovery service that contracted with, or had a written agreement with a commercial edible food generator would be required to maintain records and report to the jurisdiction. Another commenter further supported the recommendation to eliminate the 6-ton recordkeeping threshold by stating that the primary focus relative to edible food recovery must be the safe handling of food and protection of public health and safety. The commenter further noted that the ability to track the source of a food borne illness outbreak rests on the ability to trace food product throughout the food supply chain. By allowing a food recovery organization to avoid maintaining a record of where the food was obtained, a serious gap in the investigative

Comment Number	Received From	Question/Comment	Response(s)
			<p>traceability process is created. The commenter continued their argument by stating that in their many years of experience working as a food recovery organization, food recovery services and food recovery organizations that are not large enough or are incapable of maintaining a record of the source of the donated food are likely incapable of consistently handling and distributing donated food safely.</p> <p>CalRecycle carefully reviewed each comment that requested to increase the threshold and each comment that requested that the threshold be removed. Upon review and evaluation, a determination was made to remove the recordkeeping threshold for the following reasons. It is critical that any food recovery organization or food recovery service that contracts with or has a written agreement with a commercial edible food generator maintain a record of the food they collect or receive from those generators. This is critical for multiple reasons. The first reason is for enforcement purposes. All commercial edible food generators are required to maintain records of the food that is recovered from them. These recordkeeping requirements are specified in the commercial edible food generator recordkeeping section of the regulations.</p> <p>Although all commercial edible food generators are required to maintain records of the food that is recovered from them, in a previous draft of the regulations, not all food recovery organizations and food recovery services were required to maintain records. In a previous draft of the regulations, only food recovery organizations and food recovery services that collected or received 6 tons or more of edible food from commercial edible food generators were required to maintain records of the food they received from commercial edible food generators.</p> <p>The 6-ton threshold was removed because it created an enforcement issue for jurisdictions. Specifically, jurisdictions are required by SB 1383's regulations to monitor commercial edible food generator compliance. If the 6-ton threshold remained in the regulations, then a commercial edible food generator could claim that they have a contract with a food recovery organization that collects less than 6 tons per year, and also claim that they donate the maximum amount of their edible food that would otherwise be disposed to that food recovery organization. Because the food recovery organization that the generator claims they contract with recovers less than 6 tons of food per year, the jurisdiction would not be able to verify if the commercial edible food generator was in compliance.</p> <p>To eliminate this potential enforcement issue, CalRecycle removed the 6-ton threshold and revised the regulatory text. The regulations now require a food recovery organization or a food recovery service that has established a contract or written agreement to collect or receive edible food directly from commercial edible food generators, pursuant to Section 18991.3(b) to maintain records of the food they receive from those generators.</p> <p>Removing the 6-ton threshold was also critical for measurement purposes. If the 6-ton threshold remained in the regulations, jurisdictions would not receive a complete data set of the total pounds recovered from commercial edible food generators in the previous calendar year. A complete data set is critical in order for jurisdictions to report accurate data to CalRecycle so that CalRecycle can measure the state's progress toward achieving the 20% edible food recovery goal. In addition, a complete data set can be used by jurisdictions to help them assess the impact of their food recovery programs and identify the food recovery organizations and food recovery services in their area that are recovering the most food from commercial edible food generators.</p>

Comment Number	Received From	Question/Comment	Response(s)
6038	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding edible food recovery services and organizations - "(4) The total number of meals served per month if applicable. " the commentor notes: "For consistency, we recommend sticking with tracking pounds vs. meals (which required conversion factors and would make tracking more challenging)."	The language regarding total number of meals served was removed from the regulatory language.
6039	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding this jurisdiction reporting requirement "(A) A jurisdiction shall require food recovery organizations and services that are located within the jurisdiction and collect or receive 6 tons or more of edible food per year to report the amount of edible food recovered by the service or organization in the previous calendar year to the jurisdiction." The commentor notes: <ul style="list-style-type: none"> <li>• We recommend that reporting occur with the food generator/donor for consistency and ease of regulatory oversight; if reporting flows from the food recovery organization up to the local jurisdiction, then up to the State, reconciliation with the food generators' output would be very difficult.</li> <li>• Food generator reporting would be provided to the State, local jurisdictions and food recovery organizations.</li> </ul>	It is not prudent to require each individual commercial edible food generator to report information to the jurisdiction. Such a revision would require jurisdictions to review and aggregate data from thousands of commercial edible food generators rather than a much smaller number of food recovery organizations and food recovery services. For example, one food bank could work with over a hundred commercial edible food generators. It is far more efficient and feasible for a jurisdiction to review one report from the food bank rather than 100 individual reports from generators that all work with the same food bank.
6040	Coffaro, D., Second Harvest Food Bank of Orange County	Food generator reporting would be provided to the State, local jurisdictions and food recovery organizations.	It is not prudent to require each individual commercial edible food generator to report information to the jurisdiction. Such a revision would require jurisdictions to review and aggregate data from thousands of commercial edible food generators rather than a much smaller number of food recovery organizations and food recovery services. For example, one food bank could work with over a hundred commercial edible food generators. It is far more efficient and feasible for a jurisdiction to review one report from the food bank rather than 100 individual reports from generators that all work with the same food bank.
6041	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding this jurisdiction reporting requirement "(A) A jurisdiction shall require food recovery organizations and services that are located within the jurisdiction and collect or receive 6 tons or more of edible food per year to report the amount of edible food recovered by the service or organization in the previous calendar year to the jurisdiction." The commentor notes: <ul style="list-style-type: none"> <li>• Food recovery organizations should track and make records available upon request by the State (in order for the State to reconcile with food generator reporting as part of an audit or compliance review).</li> </ul>	A jurisdiction could request the records of a food recovery organization or service to reconcile or verify the records of a specific commercial edible food generator. The regulations specify that commercial edible food generators are subject to inspection, and since an "inspection" is defined in Section 18982 to include the review of applicable records, commercial edible food generators must provide jurisdictions with access to the records required under this section upon request by the jurisdiction. A failure to provide such access may be considered a failure to maintain records. Maintenance of and access to the records described is critical for jurisdictions to monitor commercial edible food generator compliance as is required in Section 18991.1 (a)(3).
6042	Coffaro, D., Second Harvest Food Bank of Orange County	Regarding this jurisdiction reporting requirement "(A) A jurisdiction shall require food recovery organizations and services that are located within the jurisdiction and collect or receive 6 tons or more of edible food per year to report the amount of edible food recovered by the service or organization in the previous calendar year to the jurisdiction." The commentor notes: <ul style="list-style-type: none"> <li>• As with Section 10.5, we recommend eliminating the 6 ton threshold.</li> </ul>	While some commenters requested that the threshold be increased from 6 tons to 12 tons, other stakeholders recommended removing the threshold completely so that any food recovery organization or food recovery service that contracted with, or had a written agreement with a commercial edible food generator would be required to maintain records and report to the jurisdiction. Another commenter further supported the recommendation to eliminate the 6-ton recordkeeping threshold by stating that the primary focus relative to edible food recovery must be the safe handling of food and protection of public health and safety. The commenter further noted that the ability to track the source of a food borne illness outbreak rests on the ability to trace food product throughout the food supply chain. 			their food recovery programs and identify the food recovery organizations and food recovery services in their area that are recovering the most food from commercial edible food generators.
3011	Coleman, J., Los Rios Community College District	I also want to know more about the SB 1383 NOP. Can you explain more about the adoption of the regulation and again if community colleges are affected or exempt? I have viewed a few items on the CalRecycle website, but wanted to have more information for its impact to our district. Perhaps it would affect the food service areas of each campus (cafeteria)? The groundskeepers green waste too? I do not believe the student classes generate much in the way of organic waste along with the employee offices, etc.	Community colleges are included in the definition of "non-local entity" and would be subject to applicable parts of the proposed regulations.
3013	Consunji, City of Downey	It is not feasible to determine and identify individual generators that contaminate a route unless containers are checked individually. Our residential curbside program utilizes automated side loading vehicles and covered bins. Adhering to the proposed legislation would require route drivers to physically examine hundreds of containers on each route on a daily basis and additional staffing resources to manage the process of notices. City recommends at a minimum to exempt residential routes from this requirement.	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
3015	Consunji, City of Downey	As in the previous comment, it is a significant administrative burden to determine individual generators that contaminate a route. Routes would need to be interrupted to inspect individual bins along this stop resulting in slower service levels and increased costs. City recommends at a minimum exempting single-family and multi-family residential routes from this requirement.	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. 3014	Consunji, D., City of Downey	<p>City services over 63,000 containers every week. A quarterly route review for all routes in the City is not possible without the addition of significant staffing and funding. The City has approximately 5 residential routes. To review those quarterly, City would have to inspect 1 residential route per day, with up to 21,000 containers per route. It is not feasible for the solid waste collection drivers to perform this task. To incorporate this additional task would require a contract amendment resulting in significant additional costs to meet this requirement. City recommends at a minimum to exempt residential routes from this requirement.</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. Comment Number	Received From	Question/Comment	Response(s)
3016	Consunji, D., City of Downey	In the current draft, a tremendous amount of effort is placed on Enforcement and Recordkeeping, which will require the City to divert scarce funds and resources away from initiatives, to an enforcement based system. The City recommends that CalRecycle reduce the burden of enforcement and record keeping so that the City may prioritize program development.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.
3136	Coss, R., Orange County Sanitation District	<p>Article 2 Section 18983.1(b)(6)(B)(1) – This section delineates activities which are deemed to be “recovery” and thus a reduction in landfill disposal. This section includes biosolids land application and references Appendix B of the federal part 503 regulations, which stipulate technology and other standards for both Class B and Class A pathogen reduction necessary for land application. The language in this section of the draft regulatory text, however, specifies only anaerobic digestion and compost as recovery activities. Appendix B provides detail on a suite of Class B and Class A pathogen reduction technologies, including far more options for achieving each Class, all of which are deemed equivalent to anaerobic digestion or composting. None of the treatment processes delineated in Appendix B would generate methane. The greenhouse gas reduction achieved via land application rather than landfilling is the same regardless of the technology employed to meet the pathogen reduction and vector attraction reduction criteria. The methane reduction is realized in the avoidance of landfilling not by the process utilized to treat the biosolids. While it is true that most biosolids in California undergo either anaerobic digestion and/or composting, other compliant technologies are also utilized and entities should not be penalized for using them.</p> <p>We strongly urge CalRecycle to replace the words “... anaerobic digestion or composting...” With “.... one of the processes, ....”. In support of this argument, please refer to the BEAM model at this link: <a href="https://casaweb.org/wp-content/uploads/2015/12/1-BrownetaLEST-GHGCalculator10.pdf">https://casaweb.org/wp-content/uploads/2015/12/1-BrownetaLEST-GHGCalculator10.pdf</a> which has been adopted by the Canadian Ministries of the Environment as a means to quantify the climate change mitigation benefits of biosolids land application.</p>	<p>CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO<sub>2</sub>e per short ton organic waste processed. Therefore, section 18983.1(b)(6)(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383.</p> <p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste.</p> <p>Please refer to Section 18983.2 for more information.</p>
3137	Coss, R., Orange County Sanitation District	Article 2 section 18983.1(c) – Includes “...or any other disposal of waste as defined by Section 40192(c) of the Public Resources Code.”, in the definition of Landfill. This is a very broad definition and seems to limit the disposition to organic waste deposited on land. We believe this is an overly restrictive definition and will create confusion because of the inclusion of technologies other than landfilling in the definition of landfill (by virtue of the cross-reference to PRC Section 40192(c)). We request that CalRecycle clarify the scope of this definition. (see comment 3 below as well).	It is unclear from the comment what “technologies” the commenter is referring to or what clarity they are seeking as to the scope of this section. To the extent the comment is addressing land application of compostable material, that activity is specifically identified as a reduction in landfill disposal if it meets the conditions of the section. To the extent the comment is addressing surface disposal sites at wastewater treatment plants, that would be considered landfill disposal under this section unless it meets the requirements of land application of biosolids under this section or qualifies as an alternative technology that constitutes a reduction in landfill disposal under Section 18983.2.
3138	Coss, R., Orange County Sanitation District	Article 6 Section 18987.2(a)(1) – The language requires all biosolids produced at any wastewater treatment plant to be treated via anaerobic digestion and/or composting and sent for land application. In addition to other treatment technologies as mentioned in comment 1 above, there are also other end uses employed which would be disallowed under this requirement. California has two incinerators and roughly five surface disposal sites located at wastewater treatment	CalRecycle has determined a regulatory language change in response to this comment is unnecessary. The overall goal of the regulations is to reduce methane emissions and the compliance options are consistent with that goal. CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO <sub>2</sub> e per short ton organic waste

Comment Number	Received From	Question/Comment	Response(s)
		<p>plants. None of the sludge produced at those facilities would ever be transported off-site and would neither be landfilled or land applied and thus would seem beyond the purview of these regulations. It would be cost prohibitive to require these facilities to change technology and management practices.</p> <p>Similarly, it is imperative that all treatment options in 40 CFR part 503 Appendix B (Class A and Class B) be allowed and viewed as “recovery” (not just anaerobic digestion and composting). Treatment technologies are themselves dynamic and emerging resulting in alternative treatment and final disposition of biosolids. For example, thermal processes can produce energy and biochar. These technologies should be encouraged, not excluded as the language in this section appears to do. Dried biosolids have long been used effectively as alternative fuel at cement kilns in place of fossil-based fuels. We recommend all treatment technologies specified in Appendix B of 40 CFR part 503 which result in land application or land reclamation should be counted as a reduction in landfill disposal. Existing biosolids management practices whereby biosolids do not leave the site should be excluded from these regulations. And emerging technology which may result in energy production (thermal) or avoid fossil-based fuels (cement kilns), but which do not send any biosolids to a landfill should be encouraged.</p> <p>Additionally, our understanding is that CalRecycle does not intend (and lacks the authority) to ban any organic waste stream from landfills. Rather, future use was to be negotiated between a wastewater plant and their jurisdiction of origin. We request that these regulations be revised to explicitly articulate that approach.</p>	<p>processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383.</p> <p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste.</p> <p>Please refer to Section 18983.2 for more information.</p>
3139	Coss, R., Orange County Sanitation District	<p>Article 9 Section 18990.1(c)(3) seems inconsistent with the language added to s. 18990.1(a &amp; b) which restricts local ordinances such that they may not impede organics recycling. Sub (c)(3) seems to supersede that restriction. Clarity or revision of this language is requested to ensure an open market across California for organics recycling.</p>	<p>A. The requested changes to the regulatory text are not necessary. However, CalRecycle is adding additional language to Section 18990.1(b)(1) to further clarify its meaning in light of comments received regarding it. Article 9, Sections 18990.1 (a) and (b) are not contradictory. 18990.1 (a) clarifies that it does not limit a jurisdiction in adopting more stringent standards than the ones outlined in this chapter. The purpose of the specific limitations set forth in paragraphs 1-5 of 18990.1 (b) are to ensure that jurisdictions do not impose restrictions on the movement and handling of waste and waste-derived recyclables that would interfere with or prevent meeting the organic waste recovery targets established in SB 1383.</p> <p>B. Article 2, Section 18983.1 (b)(6)(b) clarifies that land application of biosolids constitutes a reduction in landfill disposal provided that the application complies with minimum standards. This section specifies that to be considered a reduction in landfill disposal for the purposes of this regulation, land application of biosolids must comply with existing regulatory requirements and have undergone composting or anaerobic digestion. While this regulation defines land application as recovery, this regulation does not allow land application of biosolids be done in a manner that conflicts with existing public health and safety regulations and requirements. Land application of composted or digested biosolids prevents the landfill disposal of this material and reduces greenhouse gas emissions. This supports the state’s efforts to keep organic waste out of landfills and reduce greenhouse gas emissions and is therefore considered a recovery activity for the purposes of this regulation. The additional language will ensure that such restrictions can be reviewed on a case-by-case basis to determine if they are actually necessary and tailored to</p>

Comment Number	Received From	Question/Comment	Response(s)
			protect the public health and safety, or if they are actually unnecessary and overbroad restrictions.
3140	Coss, R., Orange County Sanitation District	<p>Article 12 Section 18993.1(f) defines eligible recovered organic waste products which satisfy the procurement requirements of s. 18993.1(e).</p> <p>i. Sub (f)(1) stipulates that compost is an eligible product. We assume this includes biosolids compost but request explicit confirmation of that. Furthermore, there are many other biosolids products which should be considered as eligible recovered organic waste products. A jurisdiction should be given broad latitude in meeting this requirement and all biosolids products meeting the land application requirements of 40 CFR part 503 should be eligible.</p>	<p>The current draft regulatory text considers compost an eligible recovered organic waste product as long as the final product meets the definition of compost, per Section 17896.2(a)(4), and is produced either at a compost operation or facility or large volume in-vessel digestion facility that composts on-site (refer to Section 18993.1(f)(1)(A) and (B). Biosolids and/or digestate that do not meet the compost definition will not count towards the procurement target.</p> <p>CalRecycle disagrees with adding “other biosolids products”. The broad range of potential products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors.</p>
3141	Coss, R., Orange County Sanitation District	<p>Sub (f)(2) stipulates that renewable transportation fuel is also an eligible recovered organic waste product. While we support the intent of this requirement to help create end markets, we question the definition of Renewable Transportation Fuel in Article 1 18982(a)(62), which requires the fuel be derived “...from organic waste diverted from a landfill and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste.” Does this exclude renewable transportation fuel which is derived from sewage sludge anaerobic digestion alone, without co-digestion? We trust that is not the intent, since anaerobically digesting sewage sludge, land applying the resultant biosolids, and producing low carbon transportation fuel is certainly consistent with the requirements of SB 1383 and these regulations. All sewage sludge which is anaerobically digested could be considered to be diverted from landfills. Please clarify whether the intent of the language is to include all sewage sludge and co-digested materials under this eligibility requirement. Alternatively, we respectfully request this definition be amended to read: “...gas derived from organic waste processed in an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 or Title 23.”</p>	<p>CalRecycle disagrees with the commenter’s argument to allow renewable gas derived solely from sewage sludge to be eligible for procurement. The regulations clarify that only renewable gas derived from organic waste received at a POTW from solid waste facilities may count towards a jurisdiction’s procurement target. Other materials digested at a POTW, such as sewage sludge, are ineligible. Renewable gas derived solely from sewage sludge is ineligible for procurement because a POTW is not a solid waste facility and therefore not in the scope of the legislative intent of SB 1383. Sewage sludge is also not typically destined for a landfill, so its use does not help achieve SB 1383’s landfill diversion goals. For the reasons noted above, gas generated from the inflows of a sewer system and not from organic waste diverted from the solid waste stream cannot logically be considered a recovered organic waste product. It is inconsistent with the requirements of SB 1383 to incentivize or mandate activities that do not contribute to landfill diversion of organic waste.</p>
3142	Coss, R., Orange County Sanitation District	<p>Sub(f)(2) – We also request that any other beneficial uses of methane be deemed eligible to qualify as fulfilling the procurement obligations. This includes pipeline injection, on-site power production and exported electricity, as well as the production of renewable transportation fuel. All should be deemed to be recovered organic waste products and eligible to satisfy the procurement requirements.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle has revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. Note that pipeline injection is not an eligible</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>procurement option in order to eliminate the potential for double-counting the same gas for different procurement targets. For example, by including pipeline injection, a jurisdiction(s) could count pipeline injected gas as well as the end use of that gas. The draft regulations do not preclude renewable gas facilities from injecting gas into the pipeline, but the language has been streamlined to clarify that only the end use of that gas (transportation fuel, electricity, heating applications) will be counted towards a jurisdiction’s procurement target.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>
3143	Coss, R., Orange County Sanitation District	2014 Waste Characterization Table – Please confirm that this Table has been updated to include biosolids data from 2014, since this serves as the baseline upon which compliance with the draft regulations is based.	The comment is not directed at regulatory text or the process CalRecycle followed during the rulemaking. Comment noted. Questions regarding the 2014 waste characterization study can be addressed and answered outside the regulatory process.
1020	Creter, Maria SGVCOG	Infrastructure Capacity: As mentioned previously, the State of California currently lacks the capacity to meet the needs for new organic waste processing. Many municipalities have expressed concerns over the ability to comply with organic waste diversion requirements due to a lack of waste disposal infrastructure. There is an uneven distribution of waste disposal infrastructure across California.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were

Comment Number	Received From	Question/Comment	Response(s)
			established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
1021	Creter, Maria SGVCOG	Additionally, capacity is limited where the infrastructure does exist. While the regulations provide a few years to implement the programs, our member agencies are heavily concerned that there is insufficient time given to develop, evaluate, and permit new facilities.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
1022	Creter, Maria SGVCOG	Our member agencies continue to seek solutions to address the need for substantial public sector funding. The issue of insufficient public sector funding continues to be one of the major challenges our member agencies face in the effort to implement new organic waste diversion programs. For example, proceeds from “cap-and-trade” programs can be channeled to offset the costs for developing additional organic recycling infrastructure.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
1023	Creter, Maria SGVCOG	it should be noted that much of the local needs would not be addressed even if additional appropriations were made to the Waste Diversion Program. Our member	Refer to Public Resources Code Section 42652.5(b) which states that a local jurisdiction may charge and collect fees to recover the costs associated with complying with these regulations.

Comment Number	Received From	Question/Comment	Response(s)
		agencies and other local municipalities continue to work diligently to address the need for funds to undertake prescribed activities, such as providing public education and updating bins and labels.	
1024	Creter, Maria SGVCOG	Enforcement: The proposed regulations allow for Corrective Action Plans and establish extended timelines for achieving compliance. SGVCOG deeply appreciates the addition of a pathway to compliance, as this considers the infrastructure challenges our member agencies may face.	Comment noted. Comment is supporting regulatory text, not a change in language.
1025	Creter, Maria SGVCOG	Penalties: Our member agencies request that CalRecycle adopt penalties in a second set of regulations to take effect at a future date. The penalties outlined in the proposed regulations appear to be pre-mature. It is recommended that CalRecycle should work through the programmatic scheme prior to implementing an appropriate set of penalties, especially due to the fact that programs have until 2022 to be implemented.	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations "may include penalties to be imposed by the Department." This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for 5053 waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.
1026	Creter, Maria SGVCOG	Procurement: The proposed regulations outline new procurement requirements that mandate local governments to purchase recovered organic waste products. These requirements may result in substantial additional costs to local municipalities that are in addition to the costs needed to comply with the extensive programmatic requirements of the proposed regulations.	A change to the regulatory text is not necessary. The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in "substantial additional costs."
1027	Creter, Maria SGVCOG	Additional costs resulting from complying with the procurement regulations represent an unfunded state mandate under Cal. Const. Article XIII B, section 6(a), as the regulations would impose a new program on cities and neither the proposed regulations nor the Initial Statement of Reasons identifies a clear state funding source	CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate. First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)). Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe "any fees" that may in the future be imposed by the numerous local jurisdictions in California as "likely" to be treated as taxes. If a

Comment Number	Received From	Question/Comment	Response(s)
			<p>fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
1028	Creter, Maria SGVCOG	Procurement -The SGVCOG requests that CalRecycle work to develop markets for such materials in a second regulatory proceeding.	<p>CalRecycle disagrees with the suggestion to phase-in procurement or to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved.</p> <p>However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022.</p>
1029	Creter, Maria SGVCOG	SGVCOG believes that the proposed regulations may place a disproportionate burden on local governments to achieve the desired short-lived climate pollutant emissions reductions.	<p>Comment noted. Commenter is not suggesting a specific change to the regulatory language but is expressing an opinion on regulatory burden. The SB 1383 statute gives clear authority to CalRecycle to place requirements on jurisdictions as a central component of achieving the organic waste diversion goals.</p>
1030	Creter, Maria SGVCOG	Such proposed regulations may rely on excessive reporting, which can further add to the expected high cost of implementing the new requirements for all affected stakeholders.	<p>A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.</p>

Section 18984.11 was revised to enforcement agency.
4147	CRRC South	Prescriptive Approach CalRecycle has concluded that the preferred means of fulfilling the requirements of SB 1383 is to develop a rather prescriptive approach to regulating the handling of organic material. The approach embodied in these regulations departs significantly	Comment noted. CalRecycle disagrees that the cost presented in the SRIA, and the subsequent estimates provided in the Appendix to the ISOR, "vastly underestimate the true cost of implementation." In the Appendix, CalRecycle presented a cost sensitivity of three scenarios. Each scenario is based on a projected disposal level. CalRecycle projected cost based on the most

Comment Number	Received From	Question/Comment	Response(s)
		<p>from traditional methods of regulating these activities and represents a wholesale shift from what had been a highly effective system emphasizing local control and flexibility, to one that, we fear, is unlikely to yield much in the way of tangible benefit. This approach will also be unduly expensive to implement. We believe the cost study Standardized Regulatory Impact Assessment (SRIA) undertaken by CalRecycle vastly underestimates the true cost of implementation, at the same time it overstates perceived economic benefits.</p>	<p>conservative projections of disposal (highest estimates of disposal and required recover of 289 million tons). CalRecycle also provided cost sensitivity for the economic value of recycled commodities and costs for transporting recovered material to market. CalRecycle relied upon the most conservative estimates for each of these sensitivity analyses (the highest estimate of transportation costs and lowest value for recycled commodities). The general comment that CalRecycle understates costs was made by several commenters but failed to specify how costs were underestimated or recommend an alternative method for estimated costs. Regarding comments that cite specific areas where the commenter believes costs are underestimated, those comments are addressed in separate responses.</p>
4148	CRRRC South	<p><b>Current Facility Impact</b>  We are also concerned about the impact these regulations will have on the existing network of AB 939 waste diversion facilities, all of which handle some element of organic material. Many of these facilities, including (but by no means limited to) mixed waste processing facilities, contribute measurably to current waste diversion efforts. Most were privately financed, and many have not yet been fully amortized. To the extent that the regulations would impose unrealistic performance requirements on these facilities, they are at risk of underutilization or even premature closure, thereby “stranding” the considerable investment made in them. This is hardly the proper signal for the state to send, particularly when by CalRecycle’s own estimates, we are more than 100 facilities shy of the inventory that will be needed to process the additional amount of organic material we hope to divert from landfills.</p>	<p>The regulations do not place direct diversion performance goals on facilities. Instead, the regulations require jurisdictions to route certain material to high-diversion organic waste processing facilities if they use certain types of collection services. The requirements are on the jurisdiction. Facilities are not subject to enforcement under the regulations for not meeting the requirements for a high-diversion organic waste processing facility.</p>
4149	CRRRC South	<p><b>Future Facility Development</b>  We also are concerned about the chilling effect this shift may have in terms of facility development and financing going forward. The regulations will send an important signal to lenders about the risks entailed in financing facilities in the future. Their confidence in making these loans will be dramatically reduced if they believe that a change of law in this form can so profoundly affect the financial viability of a facility by artificially cutting short its useful life. At a minimum, then, these regulations should acknowledge the vital role of the AB 939 network of facilities by essentially “grandfathering” them and allowing for their continued operation for a reasonable period of time, perhaps 10 years or more.</p>	<p>The regulations do not subject facilities to enforcement for not achieving diversion percentages. The regulations place affirmative facility routing requirements on jurisdictions. If a jurisdiction is concerned about how routing to high-diversion organic waste processing facilities will impact infrastructure, it could consider utilizing a collection system that doesn't require such routing.</p>
4150	CRRRC South	<p><b>Safe Harbor</b>  A separate but related concern of ours has to do with liability and enforcement generally, and the absence of some form of safe harbor or immunity for regulated entities and the jurisdictions they serve if they are unable to meet the requirements of the regulations due to circumstances over which they have little or no control. For example, if we have learned anything as a result of the recent import rules adopted by China and much of the rest of Southeast Asia, it is that in planning and implementing waste recycling policies, we cannot safely presume the sustained availability of resilient markets for recovered materials. This is no less true in the case of organics, for which adequate markets do not currently exist in many parts of</p>	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. CalRecycle has sought to address this concern in a manner that is also in compliance with the statutory targets and requirements. As noted in the Initial Statement of Reasons, which was released for public review in January of 2019:  “The draft regulations originally prohibited jurisdictions from implementing new mixed waste processing systems after 2022, and required all new services to implement source-separated curbside collection as a means of ensuring that collected organic waste would be clean and recoverable. In response to stakeholder feedback, CalRecycle eliminated the prohibition on new</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>California. When coupled with the absolute certainty that the required network of new facilities will not be brought on line within the time frames embodied in the regulations and in SB 1383 itself, one is compelled to ask why there is no allowance made for the short-term failure we all see coming?</p>	<p>mixed waste processing systems provided that the receiving facilities demonstrate they are capable of recovering 75 percent of the organic content received from the mixed waste stream on an annual basis. The performance standard addresses stakeholder concerns about limiting flexibility, without compromising the goal for the regulations to achieve the statutory requirements.”</p> <p>The ISOR goes on to note that CalRecycle crafted regulations to allow for mixed waste collection provided that these collection services transport collected material to a facility that recovers 50 percent of the organic content it received by 2022 and 75 percent by 2025:</p> <p>“With very few exceptions, unique materials can only be processed and recovered when they are kept separate from other materials. This is primarily due to the fact that distinct materials are recovered through separate processes that are specifically designed to handle only that type of material. For example, metals, paper, and plastics are remanufactured through distinct processes (e.g. metal is smelted, paper is pulped and washed). Largely because of this, while material may be valuable as a homogenous commodity, it can become difficult or impossible to recycle when it is contaminated with other materials (e.g. many materials lose their value when they are commingled with other materials.) This principle holds true, and is perhaps more of a factor in the recovery of organic waste. Required source-separation of organic waste helps ensure that organics are kept clean, separate and recoverable.</p> <p>However; throughout the informal regulatory engagement process stakeholders raised concerns about potential costs associated with providing commercial and residential generators with a third container to source separate organic waste.</p> <p>Stakeholders also noted that several cities and counties implement single container collection services and process all the collected material for recovery. Stakeholders argued that allowing the use of a single-container collection system is a viable and cost-effective alternative that can help the state meet that statutory organic waste recovery targets.</p> <p>To respond to stakeholder requests for additionally flexibility CalRecycle crafted this section and Section 18984.2. These sections allow alternatives to providing a three-container source-separated organic waste collection service. Under these section jurisdictions are allowed to require their generators to use a service that does not provide the generators the opportunity to separate their organic waste for recovery at the curb. In order to ensure that the state can achieve the statutory organic waste reduction targets, these collections services are required to transport the containers that include organic waste to high diversion organic waste processing facilities that meet minimum organic content recovery rates (content recovery rates are specified in Subdivision (b) of this section)...”</p> <p>The commenter has stated in each comment period, that they believe the requirement to recover 75 percent of the organic content collected in these mixed waste collection services is unrealistic and infeasible. In turn CalRecycle staff repeatedly communicated to the commenter that the recovery targets cannot be lowered without compromising the integrity of the regulations. This was further documented for this commenter and the public in the ISOR:</p> <p>“These minimum recovery rates are necessary because when the opportunity to recover material through source separation is lost, the state must ensure that minimum recovery levels are met at</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>processing facilities. While this section provides additional flexibility to jurisdictions, CalRecycle must consider its obligation to ensure that the regulations are designed to achieve the statutory targets. If 100 percent of jurisdictions employed this collection option in 2022 the state could not meet the mandatory recovery target of 50 percent unless at least 50 percent of the organic waste collected from these services is recovered.</p> <p>Similarly, if 100 percent of jurisdictions employed this collection option in 2025 the state could not meet the mandatory recovery target of 75 percent unless 75 percent of the organic waste collected from these services is recovered.</p> <p>Therefore, in order to meet the recovery targets specified in statute and the state’s ultimate climate goals the recovery standards included in this section are the minimum standards necessary.</p> <p>As generation of organic waste increases with population growth, these minimum recovery rates may need to be revisited. As stated previously the organic waste reduction targets are linked to a 2014 baseline of 23 million tons. This requires the state to dispose of no more than 5.7 million tons by 2025. If, as CalRecycle projects, generation increases to 26 million tons of organic waste by 2025, recovering 75 percent of 25 million tons will only reduce disposal to slightly more than 6 million tons, resulting in the state missing its organic waste recovery targets. The need for this rate increase could be mitigated if higher recovery rates are achieved through source separation, or if efforts to increase source reduction through food recovery and other methods are successful. However, the recovery rates established in this regulation should be considered an absolute minimum.”</p> <p>CalRecycle has, prior to and during this rulemaking, communicated that the recovery efficiency requirements established in the regulation is the minimum level that the statute can tolerate. The commenter suggests existing infrastructure that cannot meet this standard should be “protected” or provided a “safe-harbor.” The commenter requests changes in the proposed regulations that cannot be reconciled with the statutory targets because CalRecycle finds that it cannot propose a regulation consistent with a statutory 2025 target that permits an unknown portion of the state from implementing the requirements necessary to achieve that target.</p> <p>CalRecycle acknowledges the role of existing infrastructure and acknowledges that previous investments in infrastructure were consciously made to achieve targets that were established prior to the adoption of SB 1383. However, the legislative direction in SB 1383 is unmistakably clear. The Legislature required CalRecycle to adopt regulations to achieve mandatory organic waste reduction levels. Nothing in the regulations prevents facility operators or jurisdictions from investing in facility upgrades or adapting existing facilities to process waste in a manner that meets the minimum regulatory requirements.</p>
4151	CRRRC South	<p><b>Good Faith Effort</b>  Nothing in the underlying statute prevents CalRecycle from addressing the lack of infrastructure and markets and the related enforcement issues; indeed, you are directed by the year 2020 (Public Resources Code Section 42653(a)) to evaluate progress (or lack thereof) in these areas. It logically follows that if the assumed favorable conditions do not materialize, the regulated entities should not be made</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to</p>

Comment Number	Received From	Question/Comment	Response(s)
		to bear the liability for that failure. We are less concerned with whether relief is cast in the form of an outright exemption, as a form of immunity from enforcement, or as a determination mirroring the “Good Faith Effort” provisions of the Integrated Waste Management Act, than we are with the fact that the regulations are relatively silent on this point. What is important is the principle that relief should be available under such extraordinary circumstances. The regulations do not effectively deal with this issue. If this issue is not satisfactorily addressed, it will lead to all kinds of finger pointing and conflict, most likely encouraging litigation and implicating franchise relationships between jurisdictions, collectors, and facility operators. These issues must be confronted now and cannot be swept under the rug.	consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
4152	CRRC South	Section 18982. Definitions Generally, we suggest having uniformity in definitions with other statutes in the Public Resources Code.	
4153	CRRC South	The definition of “compostable material” needs to be modified as textiles and carpets contaminate organics recycling.	It is unclear from the comment how changing the definition of "compostable material" will avoid contamination. Fully organic textiles and carpet are compostable based on CalRecycle's understanding.
4154	CRRC South	The language in Article 10, Section 18991.1 (a)(25), defined above, should be amended to exempt non-profits: charitable religious, veterans, and community organizations that occasionally acquire donated edible food from food generators for their membership. It is not prudent or conceivable to require donated food for this purpose to be regulated beyond the requirements of the Health and Safety Code.	CalRecycle is unable to interpret the precise meaning of this comment since Section 18991.1 (a)(25), does not exist in the regulations. However, CalRecycle would like to clarify that not all food recovery organizations and services are subject to SB 1383's recordkeeping and reporting requirements. Only food recovery organizations and services that have established a contract or written agreement pursuant to Section 18991.3 (b) are required to comply, and there is no requirement for a food recovery service or organization to establish a contract or written agreement with a commercial edible food generator. In addition, some commenters also requested that ‘nonprofit charitable temporary food facility’ be removed from the definition of "food recovery organization" because identifying the edible food recovery capacity at these facilities could be very difficult. Removing “nonprofit charitable temporary food facilities” from the definition was not necessary because these entities are a type of food recovery organization that should be recognized and also can help California achieve its 20% edible food recovery goal. However, CalRecycle agreed that assessing edible food recovery capacity at nonprofit charitable temporary food facilities could be very difficult given that these entities include clubs or organizations of students that operate under the authorization of a school or other educational facility. To address this concern, CalRecycle revised Section 18992.2 (a)(2) so that jurisdictions will not be required to assess capacity at nonprofit charitable temporary food facilities located within the county and jurisdictions within the county.
4155	CRRC South	Regulatory Text: (a)(28) “Gray container” means a container where the lid of the container is entirely a shade of gray or black in color. <b>Hardware, such as hinges and wheels, on a “black or gray” container may be a different color.</b> 3. Comment: We recommend a “black container” also be defined separately as all the other color containers are defined. We also recommend consistency with the other color definitions which excludes hardware from the coloration requirement.	CalRecycle has revised the definitions of the containers to be consistent with each other. The definition of gray container in Section 18982(28) already specifies either gray or black. The term “black container” is not used in the regulation.

Comment Number	Received From	Question/Comment	Response(s)
		Thus, we request the added language above that states: <b>Hardware, such as hinges and wheels, on a “black or gray” container may be a different color.</b>	
4156	CRRC South	Regulatory Text: (a)(30) “Grocery store” Comment: It is noted that a bakery, deli, meat and/or seafood department that is not separately owned in a grocery store is part of the definition of a grocery store. Therefore, should a bakery/deli/meat and seafood operation that is separately owned in a grocery store be included, and do bakeries, deli’s, meat and seafood establishments need to be addressed in these regulations?	If a privately owned business within a grocery store independently meets any of the commercial edible food generator definitions and the associated thresholds, then the business will be required to comply with SB 1383’s commercial edible food generator requirements. If the privately owned business does not independently meet the commercial edible food generator definitions or thresholds, then it is not subject to SB 1383’s commercial edible food generator requirements.
4157	CRRC South	Regulatory Text: (a)(36) “Jurisdiction” means a city or county, or a city and county or a special district that <b>arranges or</b> provides solid waste handling services. A city or county, or a city and county, may utilize a Joint Powers Authority to comply with the requirements of this chapter, except that the individual city, county, or city and county shall remain ultimately responsible for compliance. 5. Comment: Some districts don’t directly provide handling services, rather they arrange for the services. Arrangers are non-local entities; shopping centers are arrangers.	In response to this comment, CalRecycle defined a “special district” as having the same meaning as Section 41821.2 of the Public Resources Code. Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a “special district that provides solid waste collection services” is a jurisdiction. Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction’s regulations related to solid waste. The definition of “non- local entity,” lists special districts as an example of a type of entity that could be a “non- local entity” but it does not definitively state that all special districts are non-local entities. Any special district that is a “jurisdiction” and also a “non-local entity” generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3.
4158	CRRC South	Regulatory Text: (a)(40) “Local education agency” means a school district, charter school, or <b>community college</b> , county office of education that is not subject to the control of city or county regulations related to solid waste. 6. Comment: “Community college” should be added to this definition.	Community colleges are included in the definition of non-local entity.
4159	CRRC South	Regulatory Text: (a)(42) “Non-local entity” means an entity that is an organic waste generator but is not subject to the control of a jurisdiction’s regulations related to solid waste. These entities may include, but are not limited to, special districts, federal facilities, prisons, facilities operated by the state parks system, public <b>colleges</b> /universities and state agencies. 7. Comment: Higher education is mentioned, but colleges were not referenced while universities are defined. Does a non-local entity include a special district like the Los Angeles Sanitation District that has its own board? Special districts are not defined. Is there consideration of private schools?	The regulations were clarified to include public universities and community colleges in non-local entities. Private schools fit under the existing definition of commercial business which states that a “commercial business” means a firm, partnership, proprietorship, joint-stock company, corporation, or association, whether for-profit or nonprofit, strip mall, industrial facility, or a multifamily residential dwelling. In response to this comment, CalRecycle defined a “special district” as having the same meaning as Section 41821.2 of the Public Resources Code. Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a “special district that provides solid waste collection services” is a jurisdiction. Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction’s regulations related to solid waste. The definition of “non-local entity,” lists special districts as an example of a type of entity that could be a “non-local entity” but it does not

Comment Number	Received From	Question/Comment	Response(s)
			definitively state that all special districts are non-local entities. Any special district that is a "jurisdiction" and also a "non-local entity" generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3.
4160	CRRRC South	<p>Regulatory Text:  (a)(46) "Organic waste" means solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material (<b>green material includes cannabis and hemp</b>), landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges.</p> <p>8. Comment: Also, in the definition of "organic waste," "printing and writing paper, textiles, carpets" creates a contamination for green waste. For example, these have no energy value in an Anaerobic Digestion facility. The AB 1826 (Chesbro, Chapter 727, Statutes of 2014) definition should be used:  Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.</p> <p>This definition has meaning, as it is generally used in commerce. What is currently in the draft regulations creates confusion and has no meaning in the marketplace. We would also recommend addressing palms <b>and other monocotyledons</b> and excluding them from the definition of organic waste.</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Comment noted. The regulatory text is specifically designed to prioritize or deprioritize certain types of organic waste for specific requirements. For example, organic textiles and carpet, are not subject to the same collection requirements as other types of organic waste. The prioritization reflects the portion of organic waste these materials constitute, which is small, and therefore their total methane generation potential is smaller.</p>
4161	CRRRC South	<p>Regulatory Text:  (a)(47) "Organic waste disposal reduction target" Comment: The 2014 Waste Characterization Study baseline was acknowledged by CalRecycle to be flawed, and it fails to accurately reflect the true circumstances prevailing in Southern California. Thus, it creates an inaccurate baseline for measuring progress. The 2020 analysis of the program's progress that PRC Section 42653 requires, which includes the opportunity to provide legislative recommendations should be selected as the basis for evaluating performance and progress.</p>	<p>The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle's use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study.</p> <p>However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.</p>
4162	CRRRC South	<p>(a)(51) "Paper products" Comment: In this definition, building insulation and panels should not be included.  Those materials could be contaminated with Hazardous Waste or plastic as these items are not digestible or compostable.</p>	<p>CalRecycle has revised Section 18982(51) in response to this comment. The changes include the deletion of "building insulation and panels" from the Paper Products definition. The change clarifies that these products are excluded from the definition and are not part of the suite of options available to a jurisdiction for purchasing recycled content and recyclable paper. While CalRecycle has made the recommended change, it should be noted that the broad range of</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>products listed in the Paper Products definition is intended to provide more flexibility to jurisdictions in terms of the paper products eligible for purchase. However, CalRecycle recognizes that building insulation and panels would likely not meet the requirements for recyclability specified in Section 18993.3(c)(2) and therefore agrees with the proposed revision.</p>
4163	CRRRC South	<p>(a)(54) "Printing and writing papers" Comment: "Printing and writing papers" should be taken out of the organics definition for this regulation. Recycling is considered the highest and best use for paper. This being defined as organic waste goes against decades of current practice and education that have been accomplished. It will cause confusion with the public and create burdensome costs in attempting to have the public "unlearn" what has been taught for decades. Arguably, this can have a negative impact on other recycling efforts.</p>	<p>CalRecycle recognizes that some products made from organic waste (i.e. paper products) are collected and processed differently in California. That is why the procurement requirements are separated into two components: 1) Section 18993.1 Recovered Organic Waste Products, and 2) Section 18993.3 Recycled Content Paper Procurement Requirements. CalRecycle recognizes that recovered paper flows differently from a typical food/green waste collection and processing stream, and therefore has required different elements for the procurement of end products from each stream. For example, recycled content paper is not subject to the in-state diversion requirement that organic waste is, due to the limited in-state infrastructure available for paper processing and the difficulty of verifying the paper was made from in-state recycled paper. Nothing in the draft regulations prevents printing and writing paper from achieving its "highest and best use" via recycling. The inclusion of printing and writing paper in the organic waste definition is due to the fundamental fact that paper is an organic material, made from fiber. Therefore, it is subject to the SB 1383 organic waste diversion requirements. It is unclear what the public will have the "unlearn", as written in the comment. In fact, the draft regulations have specific education and outreach requirements (article 4), intended to provide guidance for recycling and diversion efforts of all organic materials, including paper.</p>
4164	CRRRC South	<p>(a)(55) "Prohibited container contaminants" Comment: It is not clear if this prohibits "plastic bags." This could be problematic as some are used in collection systems to separate food waste from green waste. Various jurisdictions have their own "prohibited contaminants" requirements, and this should be left to the jurisdictions to make this determination. Throughout the comments, note the other references to "quarantine requirements" and this needs to be crossreferenced with the USDA/CDFA quarantine standards.</p>	<p>The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility's normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome. Regarding quarantine guidance, Section 18983.1(b)(6)(A) refers to the land application of green waste or green material that shall have been processed at a solid waste facility as defined by Section 40194 of the Public Resources Code, if it is to count as a reduction in landfill disposal. It is the responsibility of the solid waste facility to legally comply with the movement of materials as it relates to quarantine zones. Article 3 also allows jurisdictions to dispose of quarantine material if CDFA and the agricultural commissioner requires it. The SB 1383 regulations are specifically intended to address the state's goals for reducing organic waste disposal and the reduction of short-lived climate pollutants. While those goals may overlap with the purview of sister agencies, it is not the intent of these regulations to address every aspect of organics management throughout the state. As noted above, CalRecycle regularly works with CDFA as well as other sister agencies to ensure coordination with existing regulations and statute.</p>
4165	CRRC South	<p>Regulatory Text:  (a)(55)(B) Organic wastes that are, carpet, <b>textiles</b>, hazardous wood waste, non-compostable paper placed in the green container that is part of an organic waste collection service provided pursuant to Section 18984.1 or 18984.2.  13. Comment: Textiles should be included in this list of "Prohibited container contaminants."</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Comment noted. The regulations are structured to specify material that cannot be collected in certain containers, e.g. glass cannot be collected in green containers with organic waste. Further, the regulations define organic waste however they do not specifically require organic specific materials to be collected together, e.g. the regulations do not require food and textiles to be collected together. The regulations allow jurisdictions to source separate materials that are recoverable when mixed together.</p> <p>The definition of organic waste itself does not govern how specific types of materials are handled. The definition identifies which materials are organic waste. The active text of the regulation, not the definition, controls how material is handled. Nothing in the regulatory text requires textiles or dead animals to be placed in the green container.</p>
4166	CRRC South	<p>Regulatory Text:  (a)(55)(D) Organic wastes, placed in the blue container shall be considered prohibited container contaminants when those wastes were specifically identified in this chapter or through a local ordinance for collection in the green container for recovery. Paper products, printing and writing paper, wood and dry lumber may be considered acceptable and not considered prohibited container contaminants if they are placed in the blue container.</p>	<p>The regulations already allow organic waste, which can include non-hazardous wood and dry lumber, to be included in the green container. The regulations also already allow for non-hazardous wood and dry lumber to be included in the blue container. Regarding treated hazardous wood waste, CalRecycle revised Section 18984.1 to add a new subsection indicating that this material should not be allowed in the blue container.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>14. Comment: Why would wood or dry lumber be allowed in the blue (organics) recycling container? It seems that both should be considered as Construction and Demolition Waste. This is confusing. Allowing wood waste into blue containers could lead to other construction debris finding its way into the container. Wood needs further defining as various forms of it, such as untreated and treated. It should be noted that treated wood has its own specific management standards and should be prohibited in this regulation.</p>	
4167	CRRRC South	<p>Regulatory Text:  (a)(63) “Residual organic waste” means waste <del>that remains after organic waste</del> has been processed which is then sent to landfill disposal.  15. Comment: This definition needs to be clarified in the regulations.</p>	<p>A change to the regulatory text is not necessary. A text change is not necessary for the following reason: “Residual organic waste” is defined as:  (63) “Residual organic waste” means waste that remains after organic waste has been processed which is then sent to landfill disposal.  This sufficiently and correctly describes the intent of the definition which is to identify only the waste remaining and subsequently sent to a landfill after organic waste has been processed.</p>
4168	CRRRC South	<p>Regulatory Text:  (a)(72) “The 2014 organic waste disposal baseline” means the total tons of organic waste disposed statewide in 2014 as calculated by CalRecycle’s 2014 Waste Characterization Study.  16. Comment: Please see comments in this communication related to the flawed 2014 disposal baseline. SEE Comment 4236</p>	<p>The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle’s use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study.  However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.</p>
4169	CRRRC South	<p>(a)(77) “Yellow container” means a container where lid of the container is entirely yellow in color. Hardware such as hinges and wheels on a yellow container may be a different color.  17. Comment: There was concern expressed by many of our haulers that this might not be a good choice for food waste coloration as it can stain easily, lacks UV protection and can break down faster, thus increasing costs. Aesthetically, yellow containers when stained might trigger complaints.</p>	<p>CalRecycle responded to stakeholders who initially had issues with the container color being yellow because yellow containers will quickly become discolored and unattractive if used for the collection of food waste; and yellow coloration does not hold up well in UV conditions. Therefore, brown was chosen because brown coloration shows dirt less; and cart manufacturers can use higher percentages of recycled plastic to make brown versus yellow containers and lids, leading to more market demand for recycled plastic.  The jurisdiction would be able to continue to use the brown containers for manure until they reach the end of their useful life or until 2036, whichever comes first.</p>
4170	CRRRC South	<p>The following definitions should be added to this regulatory text: “Renewable Natural Gas”</p>	<p>Regarding consistency with the Public Utilities Commission (PUC), the definition of “renewable gas” in the proposed regulatory text is intentionally limited to the provisions of these regulations</p>

Comment Number	Received From	Question/Comment	Response(s)
		18. Comment: The definition needs to align with the Public Utilities Commission (PUC) definition and reconciled with other statutes and policy objectives.	and the purpose of SB 1383 statute. This definition does not prevent other agencies from defining “renewable natural gas” or “renewable gas” for a different purpose.
4171	CRRC South	The following definitions should be added to this regulatory text: “Rural Jurisdiction” 19. Comment: There are many jurisdictions for this regulation that are in larger population counties that are rural in nature and have unique circumstances that need accommodation. See other comments related to this in our comments and recommendations.	The specific term rural jurisdiction is only used in the context of rural exemptions linked to 18984.12(c). The term is effectively defined in that section with the following text: “The Department shall grant an exemption from complying with the organic waste collection requirements specified in this article for rural jurisdictions that meet the definition of a “Rural Jurisdiction” in Section 42649.8 of the Public Resources Code...”
4172	CRRC South	The following definitions should be added to this regulatory text: Additional Definitions Needed: 20. Comment: Additional definitions are needed, such as “Incompatible Material, Reuse and Remanufacturing,” especially when discussing textiles and carpets . Also, a definition of an organic waste hauler would be useful. To enhance the market development and procurement component, a definition of “pollution” should be added consistent with other statutes/policies, such as in the SWRCB Trash Policy. Reference: PRC Code §40171.	"Incompatible material" is defined in the regulations. The other suggestions are declined as unnecessary as the terms do not appear in the regulatory language in a manner that requires definition.
4173	CRRC South	Article 2 1) The 10% limit on incompatible materials is very confusing. First, the definition of incompatible materials was introduced in the 2nd Draft, and we are still trying to understand the impact of this definition. Imposing a 10% limit on incompatible material and residuals appears to operate at a 90% organics reduction requirement and not the 50% and 75% requirements required by SB 1383. These 10% requirements may very well be a limit that is impossible to achieve in 2 ½ years, even with the best possible education efforts and with the addition of costly processing equipment.	CalRecycle has revised this section to phase in the acceptable level. The change phased in the acceptable levels of incompatible material and the acceptable levels of organic waste in the material sent to disposal from 10 percent by 2022 to 20 percent on and after 2022 and 10 percent on and after 2024. This change was necessary to allow entities time to plan and make necessary adjustments to their operations.  The 50% and 75% are statewide targets. The incompatible material limit only applies when organics are being sent from a solid waste facility or operation to a secondary facility or operation for further processing. This is not a final recovery target. The incompatible material limit is to ensure the “cleanliness” of the organic waste separated from the source separated organic waste stream and mixed organic waste stream in order to ensure that the bulk of material sent out the back end of a facility will be largely compatible with the type of facility that will be accepting it for further processing.
4174	CRRC South	Article 2 2) We strongly recommend that CalRecycle distribute a flow chart of both 10% requirements so that stakeholders understand the operational aspects of these requirements and the enforcement implications. The 10% language is likely not achievable due to the inclusion of other green waste that cannot be composted or mulched, such as palms and other monocotyledons and cactus. These materials are prevalent in Southern California.	CalRecycle staff has noted the comment and will not make any further text changes in response. However, CalRecycle staff will develop tools to assist in the implementation of the regulations.
4175	CRRC South	Article 2 3) The regulations fall short as well because they do not properly account for the impacts of CDFA quarantines restricting the movement of green materials in several areas of Southern California.	Regarding quarantine guidance, Section 18983.1(b)(6)(A) refers to the land application of green waste or green material that shall have been processed at a solid waste facility as defined by Section 40194 of the Public Resources Code, if it is to count as a reduction in landfill disposal. It is the responsibility of the solid waste facility to legally comply with the movement of materials as it relates to quarantine zones. Article 3 also allows jurisdictions to dispose of quarantine material if

Comment Number	Received From	Question/Comment	Response(s)
			<p>CDFA and the agricultural commissioner requires it. The SB 1383 regulations are specifically intended to address the state’s goals for reducing organic waste disposal and the reduction of short-lived climate pollutants. While those goals may overlap with the purview of sister agencies, it is not the intent of these regulations to address every aspect of organics management throughout the state. As noted above, CalRecycle regularly works with CDFA as well as other sister agencies to ensure coordination with existing regulations and statute. Provisions were added to Section 18984.13 to address such quarantined material and overriding federal requirements.</p>
4176	CRRC South	<p>Article 3. Organic Waste Collection Services Section 18984.1. Three-container Organic Waste Collection Services  (a)(3) The gray container shall be for the collection of non-organic waste only.  22. Comment: The standard consideration for haulers is that palms and other monocotyledons cannot be processed before they are placed in the trash container, given this language. Palms and other monocotyledons should be defined as nonorganic.</p>	<p>Regarding palm fronds and monocotyledons, while these materials have been difficult to handle at composting operations, at least one facility has opened in CA that can grind this material and use it in animal feed products, reportedly at a cost significantly less than that of landfilling. Allowing jurisdictions to prohibit this material from being placed in the green container would potentially deter the development of innovative technologies to deal with this material. With respect to human and pet waste, a jurisdiction may prohibit human waste in the green or blue container in a 3-container system and in the green container in a 2-container system. This change is necessary in order to support jurisdiction efforts to minimize public health impacts. This revision does not apply to pet waste, as many jurisdictions collect manure and take this material to processing facilities that have to meet pathogen reduction requirements.</p>
4177	CRRC South	<p>Article 3. Organic Waste Collection Services Section 18984.1. Three-container Organic Waste Collection Services  (a)(4) A jurisdiction may comply with this section by providing a container or containers that are split or divided into segregated sections, instead of an entire container, as long as the lids of the separate sections of a split container comply with the container color requirements and material limitations specified in this section.  23. Comment: The ability to change the lid only is an improvement in the regulations. It has been noted that this may be an aesthetic issue for some jurisdictions and their residents.</p>	<p>Thank you for the comment. The comment is in support of the draft regulations.</p>
4178	CRRC South	<p>Article 3. Organic Waste Collection Services Section 18984.1. Three-container Organic Waste Collection Services  (a)(5)(A) [The following shall not be collected in the green container:] Carpets, non-compostable paper, and hazardous wood waste <b>and palms and other monocotyledons.</b>  24. Comment: We recommend the inclusion in the definitions section (a) “Bulky items” definition: <b>Certain items require a special pick-up, including, but not limited to, carpet/tree components/lumber/palms and other monocotyledons.</b>  There is precedent for this: CalRecycle’s February 19, 2019 presentation on the California State of Disposal and Recycling for Calendar Year 2017 has a breakout for “bulky items” and also breaks out such items as textiles and lumber as well from organics.</p>	<p>Regarding palm fronds and monocotyledons, while these materials have been difficult to handle at composting operations, at least one facility has opened in CA that can grind this material and use it in animal feed products, reportedly at a cost significantly less than that of landfilling. Allowing jurisdictions to prohibit this material from being placed in the green container would potentially deter the development of innovative technologies to deal with this material. With respect to human and pet waste, a jurisdiction may prohibit human waste in the green or blue container in a 3-container system and in the green container in a 2-container system. This change is necessary in order to support jurisdiction efforts to minimize public health impacts. This revision does not apply to pet waste, as many jurisdictions collect manure and take this material to processing facilities that have to meet pathogen reduction requirements.</p>
4179	CRRC South	<p>(b) A jurisdiction that provides a three-container organic waste collection service that complies with subdivision (a) may transport the contents of the gray container</p>	<p>Comment noted. The commenter is acknowledging support.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>to a facility that processes and recovers organic waste. A jurisdiction that complies with subdivision (a) is not required to transport the contents of the gray container to a facility that meets or exceeds the organic waste content recovery standard specified in Section 18984.3. A jurisdiction will not be considered out of compliance with subdivision (a) if it allows carpet and textiles to be placed in the gray container.</p> <p>25. Comment: The transportation protocols established in (b) are beneficial and supported.</p>	
4180	CRRRC South	<p>Section 18984.2. Two-container Organic Waste Collection Services (a)(2) The blue container shall be for the collection of all non-organic waste. However, the blue container may be used for the collection of the following types of organic wastes: paper products, printing and writing paper, wood and dry lumber, and textiles.</p> <p>26. Comment: Supplemental processing is needed for two/one container systems or the same problem will exist with textiles. "Organic textiles" needs to be clarified. Whatever container processing exists, some standard language for supplemental processing is needed.</p>	Nothing in these regulations prohibits supplemental processing of materials as long as it complies with the requirements in Section 17409.5 et seq
4181	CRRRC South	<p>Section 18984.2. Two-container Organic Waste Collection Services (a)(5)(A) The following shall not be collected in the green container: Carpets, non-compostable paper, and hazardous wood waste, <b>palms and other monocotyledons</b>.</p> <p>27. Comment: "Palms and other monocotyledons" should be added here.</p>	Regarding palm fronds and monocotyledons, while these materials have been difficult to handle at composting operations, at least one facility has opened in CA that can grind this material and use it in animal feed products, reportedly at a cost significantly less than that of landfilling. Allowing jurisdictions to prohibit this material from being placed in the green container would potentially deter the development of innovative technologies to deal with this material.
4182	CRRRC South	<p>Section 18984.3. Amend Section 18984.3 Unsegregated Single-container Collection Services to read as follows:</p> <p>(a) A jurisdiction may comply with the requirements of this article by providing a single gray container to each generator that allows for intentional commingling of all collected wastes, including organic waste, provided that the contents of the gray container are transported to a high diversion organic waste processing facility.</p> <p>(b) If the facility that the container is transported to has an annual mixed waste organic content recovery rate that is lower than required in Section 18982(a)(33) of this chapter for two (2) consecutive quarterly reporting periods or three (3) quarterly reporting periods within three (3) years, the facility shall not qualify as a high diversion organic waste processing facility.</p> <p>(c) If the jurisdiction is in violation of this section due to a facility to which it sends organic waste being unable to meet the required annual average mixed waste organic recovery rate, the jurisdiction shall be subject to the enforcement process in Section 18996.2, which may include a corrective action plan as specified in that section allowing it time to meet the requirements of this article prior to the Department seeking administrative penalties.</p> <p>(d) Notwithstanding subdivision (a), the contents of containers may be initially transported to a consolidation site as defined in Section 17402 that complies with the requirements of Section 17409.5.10.</p>	CalRecycle declines the suggested language because it will not ensure that organic waste in gray containers will be recovered at a rate that will achieve the 2025 75% organic waste diversion target in statute.

Comment Number	Received From	Question/Comment	Response(s)
		<p>(e) A jurisdiction may allow organic waste specified for collection in the gray container to be placed in bags for collection.</p> <p><b>(f) Notwithstanding subdivision (a), the contents of containers utilized in unsegregated single-container collection services may be transported, until 2030, to an organics processing facility that does not qualify as a high diversion organic waste processing facility if all of the following conditions apply:</b></p> <p><b>a. The facility is fully permitted to handle and process mixed solid waste that includes organic material.</b></p> <p><b>b. The facility was specifically designed and constructed, and has been consistently operated, as a mixed waste processing facility for a period of at least 15 years immediately prior to January 1, 2016.</b></p> <p><b>c. The facility is permitted to receive and process no more than 1500 tons per day.</b></p> <p><b>d. The jurisdictions utilizing the facility have exclusively relied on the facility to process their mixed waste and organic material for at least 15 years.</b></p> <p><b>e. More than 80% of the material processed by the facility originates from a single jurisdiction, in which a significant portion of the population lives below the federal poverty line.</b></p> <p><b>f. The facility had undergone a comprehensive upgrade involving the expenditure of not less than \$10 million within the 3-year period immediately prior to January 1, 2016.</b></p> <p><b>g. Notwithstanding subdivision (a), the contents of containers utilized in unsegregated single-container collection services may be transported to an organics processing facility that does not qualify as a high diversion organic waste processing facility for good cause, as determined by the department in the exercise of its reasonable discretion.</b></p> <p>28. Comment: Subdivision (f) above is written to address the unique circumstance confronting a single facility operating in a rural area of the Mojave Desert. We have met with CalRecycle staff on this issue, and we explained that the owner spent north of \$10 million to upgrade it just prior to the adoption of SB 1383. It is the best case of which we are aware for providing a limited continuation or grandfather right to enable the owner to recover and amortize most of her considerable investment, particularly since the communities served generate very little in the way of green waste. We are not opposed to providing temporary relief in this form to other operations and, for that reason, we have included subdivision (g) for which we have not offered specific criteria.</p>	
4183	CRRRC South	<p>Section 18984.4. Recordkeeping Requirements for Compliance with Organic Collection Regulatory Text:</p> <p>(a)(3)(D) The geographical area the hauler(s) serves; <del>or the routes serviced, or a list of addresses served.</del></p> <p>29. Comment: The language breaches proprietary information in ( a ) ( 3 ) ( D ) by including a list of addresses served. The franchise agreements and contracts protect</p>	<p>The comment refers to recordkeeping requirements for jurisdictions to retain. This information is not required to be reported publicly. To the extent that documents required to be retained in a jurisdiction's Implementation Record contains truly proprietary or trade secret information, there are existing protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow public agencies to withhold such information from public disclosure. The proposed regulations provide for this.</p>

Comment Number	Received From	Question/Comment	Response(s)
		this propriety information which would allow competitors to access this information potentially causing economic hardship	
4184	CRRRC South	<p>Section 18984.5 (b) A jurisdiction shall conduct a route review for prohibited container contaminants on <b>statistically significant and randomly sampled selected</b> containers in a manner that results in all collection routes being reviewed <del>quarterly</del> <b>annually</b>.</p> <p>30. Comment:</p> <p>1) Fiscal impacts and practicality – The proposed language changes provided for route reviews is meant as a cost-effective approach yet achieving the objectives. We also recommend this just be limited to commercial routes. In Southern California jurisdictions, such as the size of Los Angeles County geographic area and the routes served, the financial burden would be breathtaking. CRRRC Southern District commissioned a Financial Analysis of SB 1383 Costs for Solid Waste Removal Service Providers utilizing a hypothetical city in Southern California. This was one of the costliest items identified and is fraught with potential inaccuracies, work slowdowns, and other legal and customer impacts. The draft regulations fail to adequately consider the practical, operational and financial effects arising from the dramatic loss of efficiency that will occur if our members are required to implement this section of the regulations with the frequency expressed in its current form.</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements. The regulations also allow annual.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4185	CRRRC South	<p>Section 18984.5 Random route reviews – While operations vary, the commercial organics in some areas consist of crews manually going into enclosures and behind restaurants to retrieve carts or bins for organics, virtually every cart or bin on the route. Are these random route reviews necessary under these circumstances? With some collection methods, this would be done every day – Could this be considered the Route Review?</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. However, nothing prohibits the jurisdiction from inspecting every container as is presented in the commenter's example. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring</p>

4190	CRRC South	<p>Section 18984.7.Regulatory Text:  (a) A jurisdiction shall provide collection containers to generators that comply with the container color requirements specified in this article.  (b) Notwithstanding subdivision (a), a jurisdiction is not required to replace functional containers that do not comply with the color requirements of this article prior to the end of the useful life of those containers, or prior to January 1, 2032, whichever comes first.</p>	<p>Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>33. Comment: We understand changing the cart colors after their useful life; however, the metal commercial dumpsters can sometimes last much longer than the plastic carts. Does there have to be a sunset on changing these metal dumpster colors? Respraying the dumpsters when they are in for repairs is reasonable. Removing language holding metal dumpsters to a schedule or year to be repainted is required to comply with appropriate air quality management district rules governing the coating of metal parts and products.</p>	<p>discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products. Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life.</p>
4191	CRRRC South	<p>Section 18984.7. Current container color would be costly to change. Changing lids only can also be very costly. In order to make the change feasible, existing cans, including lids, should be acceptable. Only future purchases should be required in the uniform color(s).</p>	<p>Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container.</p>
4192	CRRRC South	<p>Section 18984.7. What is the definition of container for this section? Does this include dumpsters, carts, roll-offs, debris bins, etc. Clarification is needed as there is not a specific definition of container in Article 1.</p>	<p>“Containers” is a common term used to describe bins, carts, dumpsters, carts, roll-offs, debris bins, etc., and related objects.</p>
4193	CRRRC South	<p>Section 18984.7. Clarification is needed throughout the regulations. In many cases, it is unclear if the regulation is intended to apply to both commercial and residential accounts. For example, do commercial bins have to change out lids? What about useful life and the timeline if they have to be changed out? Our own economic analysis reinforced our suspicion that this is one of the most expensive items in the regulations along with audit procedures.</p>	<p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters, and commercial and residential. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement. The regulations allow labels to be applied to existing bins or lids until the containers are replaced either at the end of their useful life or by 2036. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life or by 2036. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products. Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1,</p>

Comment Number	Received From	Question/Comment	Response(s)
			2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036.
4194	CRRC South	Section 18984.7. While the SRIA acknowledges costs, did it evaluate the impact of landfilling all of these carts/containers in a window of time? Did it evaluate the container manufacturing capacity of our suppliers and whether this might lead to a “windfall” and price gouging by such companies who know they have a captive large market in California in a certain time period?	Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container.
4195	CRRC South	Section 18984.7. These regulations seem silent on the “literature” review of local building codes and possible restrictions on design/color and other aesthetic requirements. This is particularly the case in resort communities and jurisdictions with unique climates that require special considerations.	State law would preempt local regulation under these circumstances. Article 11, Section 7 of the California Constitution provides that “a county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws.” To the extent that local ordinances conflict with state requirements, they would be preempted. See eg. City of Riverside v. Inland Empire Patients Health & Wellness Center, Inc. (2013) 156 Cal.Rptr.3d 409, 56 Cal.4th 729, 300 P.3d 494. Building codes and HOAs cannot be in conflict with local, state, or federal law. Stakeholders raised concerns raised that the regulations may be in conflict with local building codes and possible restrictions on design/color and other aesthetic requirements, for example in resort communities and jurisdictions with unique climates that require special considerations. However, if a HOA’s CC&Rs require use of a particular container color that is not in compliance with these requirements, then the CC&Rs would be in conflict with state law and any local ordinances adopted by jurisdictions pursuant to these regulations. The same would apply to a building code established by a jurisdiction.
4196	CRRC South	<p>Regulatory Text: Section 18984.8.</p> <p>(a) Commencing January 1, 2022, a jurisdiction shall place and maintain a label on each new container or lid provided to generators consistent with the applicable container collection requirements and limitations of this article specifying what materials are allowed to be placed in each container.</p> <p>(b) A jurisdiction may comply with this section by:</p> <p>(1) Placing labels on containers that include written or graphic materials that indicate which materials are accepted and which are prohibited in that container or;</p> <p>(2) Providing containers with imprinted text or graphics that indicate which materials are accepted and which are prohibited in that container.</p> <p>(c) A jurisdiction may comply with this section by using model labeling provided by the Department.</p> <p>34. Comment: There is a question about who must have labels/lid colors. Further, we need clarification on what size text and graphics is required for each type of container needing a label. There need to be more specifics on this. What type of containers need labels: dumpsters/carts/roll-offs/debris bins, etc.?</p> <p>We need clarification on whether the applicable container collection requirements and limitations on the labels are to be implemented for residential customers and not commercial customers. A list on the container does not seem effective, and it is not practical for a blue container with mixed recycling in it. This is not effective instruction for the diverse communities in California.</p>	<p>Jurisdictions must provide containers with appropriate colors and lids except for indoor containers for all organic waste generators, including dumpsters, carts, roll-offs, debris boxes, etc. The regulations provide a phased timeline and flexibility on what must be included on the label and do not prescribe the size of text and specific graphics. The requirements apply to residential and commercial containers.</p> <p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers’ useful life or by 2036.</p> <p>A jurisdiction’s designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters, carts, roll-offs, debris bins, etc. The regulations specify that all containers provided by</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>With respect to containers, including compactors, owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements.</p> <p>In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to meet that statute's signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>In regards to the lid comment, a change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p> <p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>In regards to the new technology, CalRecycle is unclear on how that will help educate the generators.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>The current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier. Statute allows a local jurisdiction to charge and collect fees to recover the local jurisdiction's costs incurred in complying with the regulations adopted pursuant to this section. Additionally, CalRecycle will provide model labels.</p>
4197	CRRRC South	<p>Section 18984.11. Waivers and Exemptions Granted by a Jurisdiction Regulatory Text:  (a)(2)(A) [Physical Space Waivers] A jurisdiction may waive some or all of the organic waste collection service requirements of this article if a commercial business or property owner provides documentation, or the jurisdiction has evidence from its staff, a hauler, licensed architect, engineer, or similarly qualified source demonstrating that its premises lack adequate space for separate organic waste containers.</p>	<p>The regulations allow the jurisdiction to address this situation in the physical space waivers.</p>

Comment Number	Received From	Question/Comment	Response(s)
		35. Comments: In multi-family dwellings, bins are put in sideways. Nothing else can fit in this space.	
4198	CRRRC South	<p>Section 18984.11. Regulatory Text:  (a)(2)(A) A jurisdiction may waive some or all of the organic waste collection service requirements of this article if a commercial business or property owner provides documentation, or the jurisdiction has evidence from its staff, a hauler, licensed architect, engineer, or similarly qualified source demonstrating that its premises lack adequate space for separate organic waste containers.</p> <p>36. Comments: Space waivers should be grandfathered in unless space is changed to accommodate new/more containers, then compliance should be executed.</p>	<p>According to jurisdictions with similar space constraints waivers, very few businesses can demonstrate the existences of space constraints that cannot be addressed. There are few instances where a business’s existing waste collection space could not accommodate an additional organic waste recycling container if the existing containers are downsized (e.g. two 90-gallon bins could be replaced with three 60-gallon bins and occupy the same space). This waiver intends to allow flexibility for businesses with legitimate and cost-prohibitive space constraints without compromising the state’s ability to achieve the organic waste reduction targets. Allowing existing business that do have the ability to implement organic waste collection be grandfathered into the space waiver would reduce the state’s ability to achieve the established organic waste diversion and greenhouse gas reduction targets.</p> <p>Also, there is no requirement to re-inspect on a particular frequency. If the space issue was resolved, then the waiver would be rescinded.</p>
4199	CRRRC South	<p>Section 18984.12.Regulatory Text:  (a) Low population waivers:  (1) An incorporated city or a special district that provides or arranges solid waste handling services may apply to the Department for a waiver for the jurisdiction and some or all its generators from some or all of the requirements of this article if the following apply.  (A) The jurisdiction disposed of less than 5,000 tons of solid waste in 2014 as reported in the Disposal Reporting System.  (B) The jurisdiction has a total population of less than 5,000 people.  (b) Waivers issued pursuant to subdivision (a) shall be good for a period of up to two five years and shall be subject to approval by the Department as follows:  (1) A jurisdiction shall submit a request for a waiver with the following information:  (A)The number of generators that will be included in the waiver.  (B) The requested length of the waiver.</p> <p>37. Comment: A special district that arranges or provides solid waste handling services must be added to this section to make it consistent with the definition of Jurisdiction. The waiver language in (b) needs to be changed to be good for a period of up to five years. This will allow flexibility at the discretion of the Department for low-income disadvantaged communities with unusual circumstances and will afford greater discretion for franchise contract implementation and renewal.</p>	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA’s definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a> ); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-document history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife’s black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383’s organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p> <p>Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
4200	CRRRC South	<p>Section 18984.12.Regulatory Text:  (c) Rural Exemptions:  (1)The Department shall grant an exemption from complying with the organic waste collection requirements specified in this article for Rural Jurisdictions that meet the definition of a “Rural Jurisdiction” in Section 42649.8 of the Public Resources Code, if the governing body of the jurisdiction adopts a resolution that includes a finding as to the purpose of and need for the exemption.  (2) An exemption implemented pursuant to this subdivision shall be valid until January 1, 2025, or until five years after the Department makes a determination pursuant to Section 42649.82 (a)(2)(D) that the statewide disposal of organic waste</p>	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers. CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square</p>

		<p>has not been reduced to 50 percent of the level of disposal during the 2014 calendar year, whichever is later.</p> <p><b>New (d) proposed language</b>  <b>Amend Section 18984.12 Waivers and Exemptions Granted by the Department to include new text as follows:</b>  <b>(d) Facility Financing or other Good Cause Exemption</b>  <b>(1) The Department shall grant an exemption from complying with the applicable organic waste collection requirements specified in this Article for jurisdictions and haulers that can demonstrate good cause for an exemption. As used herein, the term “good cause” specifically includes, but is not limited to, the circumstance wherein the hauler and the jurisdiction have cooperated in financing, and supporting through corresponding service rate adjustments, the development or improvement of a compost operation, an AD facility or a materials recovery facility that handles solid waste including organic materials, and contributes to the jurisdiction’s ability to meet its waste diversion obligations under the Integrated Waste Management Act.</b>  <b>(2) An exemption implemented pursuant to this subdivision shall be valid until the first to occur of (i) January 1, 2030, or (ii), in the case of an exemption granted as a result of a borrowing for the purpose of developing or improving a compost facility, AD facility, materials recovery facility, until the loan incurred to develop or improve the facility has been fully paid.</b></p> <p>38. Comment: Though not specifically addressed in the above language, we note that an exemption is also needed for jurisdictions in remote locations in the southern portion of the state’s desert areas that have minimal contributions to make in reducing methane and other GHG emissions. They don’t generate anywhere near the average amount of green or other organic material. Some of these areas are as remote as anywhere in the state, but they may not qualify for “rural” status because they lie within large counties that have high population communities located elsewhere in the county. Imperial, San Bernardino and Riverside Counties come immediately to mind. In keeping with the language of SB 1383 (Lara 2016), efforts to reduce emissions of short-lived climate pollutants should focus on areas of the state that are significantly affected by poor air quality.</p>	<p>mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA’s definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a> ); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. 			<p>of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383's organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p> <p>Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
4201	CRRRC South	<p>Section 18984.13. Emergency Circumstances  39. General Comment on Waivers: We have raised in prior communication that fecal matter can always be present in our containers, and having a less frequent collection waiver than required in §17331 of Title 14 of the California Code of Regulations could pose health and safety concerns and not be in compliance with other public health requirements.</p>	<p>Nothing in the regulations exempts jurisdictions from existing public health and safety requirements regarding the requirement to collect waste in a manner that does not create threats to public health and safety. The language regarding collection waivers specifies that the jurisdiction must demonstrate to the enforcement agency that a collection frequency waiver will not impact the receiving solid waste facilities ability to comply with solid waste facility permitting standards related to protecting public health and safety from the handling of solid waste. CalRecycle cannot verify that a green or gray container would not include putrescible waste, it is likely that at least one container, which ever contains food will be putrescible. Which is why approval for 14 day collection is subject to review by the EA.</p>
4202	CRRRC South	<p>Section 18985.2. Edible Food Recovery Education and Outreach  40. Comment: Same comment as presented in Comment 39 (CalRecycle Comment 4201). This should be an early adoption. Evaluation of the effectiveness of this effort should be done prior to other actions.</p>	<p>Comment noted. Commenter is expressing an opinion but not recommending specific language changes</p>
4203	CRRRC South	<p>Article 5. Generators of Organic Waste Section 18986.1. Non-Local Entities Requirements  41. Comment: Does this include schools?</p>	<p>Schools are included in the definition of local education agency.</p>
4204	CRRRC South	<p>Article 5. Generators of Organic Waste Section 18986.1. Non-Local Entities Requirements  Regulatory Text:  (c)(1)(A) [The following shall not be collected in the green container or blue container:] Textiles, carpets, plastic coated paper, and human or pet waste.  42. Comment: This language describing what cannot be included in the green or blue container is confusing when considered with other sections.</p>	<p>Thank you for the comment. CalRecycle amended the applicable sections for consistency.</p>
4205	CRRRC South	<p>Article 6. Biosolids Generated at a Publicly Owned Treatment Works (POTW)  Section 18987.2. Biosolids and Sewage Sludge Handling at a POTW  43. Comment: This section requires that biosolids be transported to composting or AD, unless the "biosolids are not suitable for additional processing or recovery." Biosolids can currently be disposed or used for beneficial reuse. We are not sure what "suitable for additional processing" means. In any case, we believe that the nondisposal option for landfilling or beneficial reuse of biosolids should be allowed, particularly during winter months when other recycling or land application options are limited.</p>	<p>CalRecycle deleted Section 18987.2 in response to comments.</p>

Comment Number	Received From	Question/Comment	Response(s)
		This section should be deleted or at least should define what “suitability” means and revised to reflect that “use for beneficial reuse” is not disposal.	
4206	CRRRC South	Article 7. Regulations of Haulers Section 18988.1. Jurisdiction Approval of Haulers and Self-Haulers 44. Comment: Clarifying language should be included to address CDFA quarantine.	Thank you for the comment. Language was added regarding quarantines and CDFA.
4207	CRRRC South	Section 18988.2. Organic Waste Hauler Requirements 45. Comment: Clarifying language should be included to address CDFA quarantine.	Thank you for the comment. Language was added regarding quarantines and CDFA.
4208	CRRRC South	Section 18988.2. Organic Waste Hauler Requirements Regulatory Text: (c)(2) [Notwithstanding (a), this section is not applicable to] A hauler that is <b>lawfully</b> transporting construction and demolition debris in compliance with Section 18989.1. 46. Comment: Add “lawfully” to clarify.	Thank you for the comment. The comment is in support of current language.
4209	CRRRC South	Section 18988.3. Self-haulers of Organic Waste 47. General Comment: CalRecycle in consultation with CDFA needs to provide clarifying language and instructions regarding CDFA quarantine areas and permissible transport and disposal.	Thank you for the comment. Language was added regarding quarantines and CDFA and permissible transport and disposal.
4210	CRRRC South	Section 18988.4. Recordkeeping Requirements for Compliance with Jurisdiction Hauler Program 48. General Comment: We agree with the concerns raised by others commenting on these regulations that this section should be eliminated for fear that it could make certain information available to one’s competitors that is now protected from disclosure.	The comment refers to recordkeeping requirements for jurisdictions to retain. This information is not required to be reported publicly. To the extent that documents required to be retained in a jurisdiction’s Implementation Record contains truly proprietary or trade secret information, there are existing protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow public agencies to withhold such information from public disclosure.
4211	CRRRC South	Article 8. Cal-Green Building Standards Section 18989.1. CalGreen Building Codes 49. Comment: This section needs to be updated to include the following supplement revision record for the State of California, including but not limited to: Building Standards Code (Cal. Code Regs., Title 24) was published July 1, 2016, with an effective date of January 1, 2017. Additionally, the intervening supplement was published January 1, 2017 with an effective date of July 1, 2018. 2016 Title 24, Part 11, California Green Building Standards Code. The supplement was issued by the California Building Standards Commission in order to provide new and/or replacement pages containing recently adopted provisions for California Code of Regulations, Title 24, Part 11, of the 2016 California Green Building Standards Code. It should be noted and included by reference that California Green Building Standards Code referenced California Code of Regulations, Title 23. Waters, Division 2. Department of Water Resources, Chapter 2.7. Model Water Efficient Landscape Ordinance with the following text: MODEL WATER EFFICIENT LANDSCAPE ORDINANCE (MWELO). [HCD] The California model ordinance (California Code of Regulations, Title 23,	CalRecycle amended the language to codify the most recently adopted versions of CalGreen and MWELO. The revision date of these requirements is included in the regulatory text, rather than incorporating the text by reference, this has the same regulatory effect. CalRecycle cannot adopt regulations that will “automatically” updated whenever a later standard of CalGreen or MWELO is adopted. If a more stringent standard is subsequently adopted (e.g. increasing the C&D diversion requirements) jurisdictions can and should comply with the new standard. Complying with a new more stringent standard would constitute compliance with the existing standard, however CalRecycle could only enforce the standard included in the regulation.

Comment Number	Received From	Question/Comment	Response(s)
		<p>Division 2, Chapter 2.7), regulating landscape design, installation and maintenance practices. Local agencies are required to adopt the updated MWELo or adopt a local ordinance at least as effective as the MWELo.</p> <p>These references are germane to the organics and recycling provision of the CalRecycle SB 1383 pending regulations.</p>	
4212	CRRc South	<p>Article 9. Locally Adopted Standards and Policies  Section 18990.1. Organic Waste Recovery Standards and Policies  50. Comment: This language needs additional flexibility built into it for changes in market conditions and technology advancements.</p>	<p>A change to the regulatory text is not necessary. This section will not conflict with market conditions. Potential market shifts will impact all facilities. This section is necessary because the statute is intended to increase organics recycling, not decrease organics recycling. This provision is simply designed to prohibit a jurisdiction from requiring a generator to send its material to a facility that will recycle less of it than one they are currently sending it to.</p>
4213	CRRc South	<p>General Comment on Article 12: The Short-Lived Climate Pollution Reduction Strategy notes that CalRecycle, as one of its work efforts, is to identify, develop and expand markets for the use of compost, mulch, and renewable fuels and energy. Pursuant to this charge CalRecycle, within the proposed SB 1383 regulatory language, is to focus on strengthening jurisdictions procurement requirements relative to use of recycled organic products. For the purposes of clarity, the term procurement is associated with compost products rather than organic waste products. The distinction being that compost as defined by the USCC is a manufactured product rather than an organic waste product.</p> <p>The USCC Official Definition is:  Compost is the product manufactured through the controlled aerobic, biological decomposition of biodegradable materials. The product has undergone mesophilic and thermophilic temperatures, which significantly reduces the viability of pathogens and weed seeds and stabilizes the carbon such that it is beneficial to plant growth.</p> <p>Given that compost is a beneficial product rather than a waste product, it now becomes commoditized biogenic products with marketable end uses to meet jurisdiction procurement requirements, thereby stimulating urban market demands. According to the SB 1383 Infrastructure and Market Analysis Draft Report (CalRecycle, March 2019), composters show a number of sub-products manufactured by them. Subproducts are those products made from the larger categories of compost, mulch, and landfill uses. Soil blends using compost leads the list with 56 percent of composters reporting this use, but composters also make topsoil (26 percent), mixes for erosion control (24 percent), and bagged products (20 percent). Only 6 percent of composters report producing engineered soil, showing perhaps the technical nature of that use. As a sub-product of mulch, composters make organic waste products such as: screened mulch (32 percent), pathogen reduced mulch and colored mulch (20 percent each), and mulch for direct land application (18 percent). As for landfill uses, ADC dominates at 28 percent, with erosion control a close second at 26 percent.</p> <p>Given this general comment, it is recommended that the language of Section 18993.1 be revised to reflect the language of the Short-Lived Climate Reduction</p>	<p>CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p>

		Strategy and the SB 1383 Infrastructure and Market Analysis Draft Report. Add and delete word changes have been made using strikeouts and underlines.	
4214	CRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target Regulatory Text:</p> <p>(a) Except as otherwise provided, commencing January 1, 2022, a jurisdiction shall annually procure a <del>quantity of recovered organic waste</del> compost products that meets or exceeds its current annual <del>recovered-disposed organic waste product procurement</del> <del>waste</del> targets as determined by this article.</p> <p>(b) Annually, the Department shall assign and provide notice of the annual <del>recovered organic waste</del> <b>compost</b> product procurement target for each jurisdiction, which shall be calculated by <del>multiplying the per capita procurement target by the jurisdiction population where:</del></p> <p><del>(1) Per capita procurement target = 0.07 tons of organic waste per California resident per year. an annual percentage incremental increase of compost product procurement based on 36 percent of the total disposed organic waste reported by a Jurisdiction's disposal report for the 2014 base year.</del></p> <p>52. Comment: The basis for the 36 percent is found in the SB 1383 Infrastructure and Market Analysis Draft Report under the heading "Materials Sold by Market Segment". It is noted that most composters report selling to both landscape and agricultural markets (78 percent and 76 percent respectively). Forty-eight percent of composters report selling into the nursery market; 36 percent into municipal projects; 20 percent to boiler fuel; 18 percent to landfills for ADC; and 16 percent to landfills for other beneficial use</p>	<p>CalRecycle disagrees with the narrow approach to procure only "compost products". CalRecycle's approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter's approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p> <p>CalRecycle also disagrees on the revision to base the procurement target on disposed organic waste. SB 1383 requires a dramatic reduction in organic waste disposal, which would result in an equivalent reduction in the procurement target which is inconsistent with the intent to build markets.</p> <p>CalRecycle disagrees with the proposed revision for the procurement target formula. The suggested language is unclear in meaning and justification.</p>
4215	CRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target Regulatory Text:</p> <p>(2) Jurisdiction <del>population equals the number of residents in a jurisdiction, using the most recent annual data reported by the California Department of Finance.</del> <b>annual percentage incremental increase of compost product procurement is based on the previous year's jurisdiction organic disposal report, incrementally increased over a five-year period from baseline procurement to reach 50 percent or a twelve percent increase in five years.</b></p>	<p>CalRecycle disagrees with the proposed revision for the procurement target formula. The suggested language is unclear in meaning and justification. If the intent of the comment is to require jurisdictions to procure 100% of their procurement target from compost, CalRecycle disagrees with this narrow approach. CalRecycle's approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter's approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p>
4216	CRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target Regulatory Text:</p> <p>(c) The Department shall provide notice to each jurisdiction of its annual <b>compost</b> <del>recovered organic waste product</del> procurement target by posting such information on the Department's website and providing written notice directly to the jurisdiction.</p> <p>(d) Beginning January 1, 2022 and every five years thereafter, the Department shall recalculate the annual <del>recovered organic waste</del> <b>compost</b> product procurement target for each jurisdiction according to the requirements of subdivision (b).</p>	<p>CalRecycle disagrees with the narrow approach to base the procurement target on compost only. CalRecycle's approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter's approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p>

Comment Number	Received From	Question/Comment	Response(s)
4217	CRRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target (e) A jurisdiction shall comply with subdivision (a) by one or both of the following:</p> <p>(1) Directly procuring <del>recovered organic waste</del> <b>compost</b> products.</p> <p>(2) Requiring, through a written contract, that a direct service provider to the jurisdiction procure recovered organic waste products and provide written documentation of such procurement to the jurisdiction.</p>	<p>CalRecycle disagrees with the narrow approach to base the procurement target on compost only. CalRecycle’s approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter’s approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p>
4218	CRRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target (f) For the purposes of this article, the recovered organic waste products that must be procured are:</p> <p>(1) Compost <b>products</b>.</p> <p>(2) Renewable transportation fuel, <b>mulch and through-put on anaerobic digestion operation as it turns into compost</b>.</p>	<p>CalRecycle disagrees with the narrow approach to base the procurement target on compost only. CalRecycle’s approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter’s approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p> <p>Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.</p> <p>Regarding “through-put on anaerobic digestion”, the language is vague and unclear. If the commenter is referring to digestate from anaerobic digestion that is then composted, the current draft regulatory text does consider compost an eligible recovered organic waste product as long as the final product meets the definition of compost, per Section 17896.2(a)(4), and is produced either at a compost operation or facility or large volume in-vessel digestion facility that composts on-site (refer to Section 18993.1(f)(1)(A) and (B). Biosolids and/or digestate that do not meet the compost definition will not count towards the procurement target.</p>
4219	CRRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target (g) The following conversion factors shall be used to convert tonnage in the annual <del>recovered organic waste product</del> <b>compost</b> procurement target for each jurisdiction to equivalent amounts of recovered organic waste products:</p> <p>(1) One ton of organic waste in a recovered organic waste product procurement target shall constitute:</p> <p>(A) 19 diesel gallon equivalents, or “DGE,” of renewable transportation fuel.</p> <p>(B) 0.58 tons of compost.</p>	<p>CalRecycle disagrees with the narrow approach to base the procurement target on compost only. CalRecycle’s approach recognizes the diverse number of jurisdictions across the state and allows flexibility for jurisdictions to use any combination of recovered organic waste products, rather a one-size-fits-all mandate. This approach is commensurate with the highly ambitious organic waste diversion targets mandated by SB 1383. The commenter’s approach would not be sufficient to create the necessary markets for recovered organic waste products for the more than 25 million tons that must be diverted by 2025.</p>
4220	CRRRC South	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target (h) If a jurisdiction’s annual recovered organic waste product procurement target exceeds the jurisdiction’s total procurement of <b>compost or</b> transportation fuel and renewable transportation fuel from the previous calendar year as determined by the conversion factors in subdivision (g), the jurisdiction is only required to procure recovered organic waste products described in (f) in an amount equal to its total purchase of transportation fuel and renewable transportation fuel from the previous year.</p>	<p>The referenced section has been revised to Section 18993.1(j). CalRecycle disagrees with the proposed revision to add compost in Section 18993.1(j) on the basis that equivalent products are not well defined and lack conversion factors. The intent of this section is to provide jurisdictions with a method to lower the procurement target to ensure that a jurisdiction does not procure more recovered organic waste products than it can use. Given the potential difficulty of determining conversion factors for comparable products to compost (e.g. liquid chemical fertilizers compared to solid compost), jurisdictions have the option to use their previous year’s procurement of gas, which have readily available organic waste conversion factors, to lower their procurement target. The focus on energy products is intended to simplify the process by which a jurisdiction can lower its procurement target. Although this mechanism relies only on fuel,</p>

Comment Number	Received From	Question/Comment	Response(s)
			electricity, and gas procurement, a jurisdiction can still choose to meet its lowered procurement target with any recovered organic waste products, including compost.
4221	CRRRC South	Section 18993.1. Recovered Organic Waste Product Procurement Target (i) A jurisdiction shall identify additional procurement opportunities within the jurisdictions' departments and divisions for expanding the use of <b>compost products, renewable transportation fuels or</b> recovered organic waste products.	Note the referenced section has been revised to 18993.1(k). CalRecycle disagrees with the proposed revisions as unnecessary because the products considered to be "recovered organic waste products" are already clarified in 18993.1(f), therefore the proposed edits would be redundant. After the rulemaking is finalized, CalRecycle will provide tools and support for jurisdictions in meeting Article 12 requirements.
4222	CRRRC South	53. Comment: Here are two ideas to develop on Article 12. Procurement of Recovered Organic Waste Products: 1. Perhaps the "procurement target" be developed based on a focus on Soil Organic Matter (SOM) content. Much science supports a healthy SOM of 5%, and the soils of California are notoriously below 1%. Those communities can "correct" their SOM content through use of these products.	The purpose for the procurement target methodology is to create a transparent method for local governments to create markets for products generated by organics recycling facilities that is proportional to the number of residents in a jurisdiction. California has over 400 diverse jurisdictions it is impractical, unnecessary, and it would be overly burdensome to account for each jurisdiction's soil organic matter content and to develop a procurement target and enforcement policy for each one. Furthermore, by only accounting for soil organic matter, the procurement target would eliminate options for jurisdictions to procure other recovered organic waste products, such as renewable gas for transportation. CalRecycle disagrees with a blanket requirement for all jurisdictions to use a certain amount of each type of material. For example, a jurisdiction may not have a use for compost. By requiring blanket usages for each product, jurisdictions may be forced into procuring products that may be incompatible with their local needs. The regulations as written allow jurisdictions the flexibility to procure products that fit their local needs.
4223	CRRRC South	Comment: Here are two ideas to develop on Article 12. 2. It is logical to include other products under the definition of ROWP, Chipped wood, bark, tree trimmings can be used as mulch and it does not have to be composted in order to be useful for weed abatement, water savings, and for protecting soil. Liquid organic fertilizers have been derived from these waste products and there is no provision for their purchase. If the regulations require Cities or jurisdictions to take back OM on a per capita basis, it would likely run into issues of stockpiling unwanted OM. A per capita is difficult or impossible to absorb. Agricultural soils are starving for the OM and therefore would be a better end-use for state generated and recycled OM whether it be in compost or liquid organic fertilizers, or mulches and topdressings.	Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards.  Regarding "stockpiling", CalRecycle recognizes that, in some extraordinary cases, the procurement target may exceed a jurisdiction's need for recovered organic waste products. Section 18993.1(j) provides jurisdictions with a method to lower the procurement target to ensure that a jurisdiction does not procure more recovered organic waste products than it can use. It can do this by showing that the amount of fuel, electricity, and gas for heating applications procured in the previous year is lower than the procurement target.
4224	CRRRC South	Section 18993.4. Record Keeping Requirements for Recycled Content Paper Procurement 54. General Comment (for end of Article 12, applying to the entire article): "Recycled" should be considered highest and best use.	Nothing in the draft regulations prevents printing and writing paper from achieving its "highest and best use" via recycling. The inclusion of printing and writing paper in the organic waste definition is due to the fundamental fact that paper is an organic material, made from fiber. Therefore, it is subject to the SB 1383 organic waste diversion requirements.
4225	CRRRC South	Article 13. Reporting Section 18994.1. Initial Jurisdiction Compliance Report 55. Comment: Our members desire to actively participate in the development of any draft or model ordinance as their input and unique perspective will be of value to the effort.	Comment noted. Comment is not recommending a change to the regulatory text.

Comment Number	Received From	Question/Comment	Response(s)
4226	CRRC South	Article 14. Enforcement Requirements 56. General Comment on Article 14: This article could prompt a lawsuit concerning data on emission increases.	Comment noted. Commenter is expressing an opinion regarding litigation risk but is not suggesting a particular language change.
4227	CRRC South	Article 14 Section 18995.1.57. Comment: Residential service should not be included in this section. Economic impact should be considered. When reviewing the SRIA document which we believe understates the impacts and overstates the benefits, we still note that the department indicates it will take over 60 new staff (approximately \$7.3 million annually) to implement this, and revenue appears to come from this regulation. Thus, we have obvious concerns for a “bounty hunter” approach to enforcement to become the culture. We also ask that the regulations include some form of reasonable or credible evidentiary standard that CalRecycle must follow before it can pursue enforcement efforts.	However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.
4228	CRRC South	Article 14 Section 18995.3. 58. Comment: Investigations must be made on first hand credible evidence to determine if there is a conscious attempt to circumvent compliance of the proposed regulations.	Comment noted. Comment is not recommending a change to the regulatory text.
4229	CRRC South	Article 14 Section 18995.4. Comment: We urge that a form of graduated enforcement be considered. We also renew our request for clarification on the “Corrective Action Plan” and when a jurisdiction is deemed to not be implementing all of the program. If a jurisdiction is not doing all that it must, then the jurisdiction’ ability to undertake enforcement against its hauler or others needs to be suspended or limited in some fashion. Otherwise, some may simply opt to force all implementation efforts down to others under their administrative or contractual control, rather than taking the steps requested of them.	A change to the regulatory text is not necessary. Section 18995.4(b) explains that if an entity is unable to comply due to circumstances outside of its control, such as the jurisdiction is on a Corrective Action Plan, than a jurisdiction may grant extensions to the entities compliance deadlines until the jurisdiction is in compliance, hence allowing the entity to also comply.
4230	CRRC South	Article 14 Section 18995.4. Concerns have also been expressed that 90 days does not provide adequate time to respond to ordinance program deficiencies.	CalRecycle has revised section 18996.1(e) in response to this comment. The change increases the relevant timeline to 180 days.
4231	CRRC South	Article 14 Section 18995.4. There should be some expression of “reasonable notice” for access to inspection, and clarification is needed on facility inspections that are authorized in this regulation: compost, MRF, hauler facilities?	Comment noted, a change to the regulatory text is not necessary. Section 18996.4 states that an authorized Department employee or agent may enter the premises of any entity subject to this chapter. Haulers, material recovery facilities, compost facilities and other solid waste facilities are regulated under other chapters of Title 14. Those provisions are not subject to this rulemaking process.
4232	CRRC South	Article 6.2 Section 17409.5.2 . Comment: Taking one cubic yard samples from each organic waste type separated after processing at the facility on that operating day is not workable. There are too many waste types defined under these proposed regulations. This activity would take up too much valuable working floor space in addition to disrupting business activity and creating an unsafe working condition for staff. Please keep in mind that anytime you place human beings alongside heavy equipment the probability of an accident, injury or death increases significantly. This would also be a very time consuming and costly endeavor each time the sampling would take place. Even	CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling.  The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite

Comment Number	Received From	Question/Comment	Response(s)
		<p>doing this activity based upon material type on a periodic basis would create a hardship for operators of these facilities. This process needs to be significantly scaled back or eliminated all together for safety and logistical reasons. This safety issue may also be in conflict or implicate CALOSHA regulations.</p>	<p>sample be a random and representative of a typical operating day for 10 consecutive days per reporting period. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
4233	CRRRC South	<p><b>A WORD ABOUT STATUTORY BACKGROUND AND SCOPE OF LAW</b></p> <p>As further detailed below, we have real concerns about the lack of a proper relationship between these regulations and the statute that gave rise to them. The final Short-Lived Climate Pollutant Reduction Strategy (SLCP Strategy) was developed pursuant to SB 605 and SB 1383 and lays out a range of options to accelerate SLCP emission reductions in California, including regulations, incentives and other market-supporting activities.</p> <p>For organic waste currently landfilled, the California Department of Resources Recycling and Recovery (CalRecycle) has consulted with the Air Resources Board (ARB) to develop regulations to reduce the level of the statewide disposal of organic waste by 50 percent of 2014 levels by 2020 and 75 percent of 2014 levels by 2025. These regulations will take effect on or after January 1, 2022. The CalRecycle regulations are reported to do the following: 1) allow jurisdictions that want to adopt early the ability to do so, thus contributing to the 2020 goal; and 2) provide clear direction to all jurisdictions, their service providers, and regulated businesses with state minimum standard so that they can plan and budget for the required program changes that will need to take effect in 2022.</p> <p>Key issues associated with increasing actual recycling capacity and diversion include quantifying the co-benefits and the GHG emission reduction benefits of applying compost, addressing the crossmedia regulatory tradeoffs between product use benefits relative to compost facility impacts, making beneficial use of compost end products or biomethane generated from anaerobic digestion projects, and overcoming difficult issues associated with siting, social acceptance, CEQA mitigation, and other issues related to new organics processing facilities. Under SB 1383, 20 percent of the edible food destined for the organic waste stream is to be recovered to feed people in need by 2025. CalRecycle has initiated new ways to foster food waste prevention and edible food recovery through state minimum standards.</p> <p>The State has already established its intent to phase out the disposal of organics from landfills. Existing law sets a goal to source reduce, recycle or compost solid waste and provides other measures and requirements to support diverting organics from landfills. California will build on that intent and progress, with regulated market and institutional support to reduce disposal of organics. Due to the multi-year timeframe required to breakdown landfilled organic material, emissions</p>	

Comment Number	Received From	Question/Comment	Response(s)
		<p>avoided by diverting organic material in one year are realized over several decades to come. These actions are estimated to reduce landfill emissions by 4 MMTCO<sub>2</sub>e in 2030; by estimating one year of waste diversion in 2030, it is expected to avoid 14 MMTCO<sub>2</sub>e of emissions over the lifetime of waste decomposition.</p> <p>Quantifying emissions from landfills is difficult due to their area-wide nature and several landfill-specific factors. In the GHG inventory and its climate programs, ARB assumes a methane capture efficiency of 75 percent at landfills. This conforms with common practice nationally. In its Landfill Regulation, ARB estimated that the landfill regulation may increase the collection efficiency at regulated landfills to 80-85 percent.</p> <p>The statute establishes a data baseline using the 2014 waste characterization study for organic waste disposal and requires the department and the board by July 1, 2020 to analyze progress by the waste sector, state and local government in achieving the goals and authorizes the department to include additional incentives and requirements. The statute also allows the department in consultation with stakeholders to make recommendations to the Legislature for revisions to the organic waste reduction goals.</p>	
4234	CRRRC South	<p>It should be noted that the final draft SB 1383 regulations do not comport to achieve the strategic thresholds of the SLCP Strategy, but simply is a means of setting state minimum standards to regulate physical contamination by establishing excessively punitive waste management standards and oversight that ignore the impacts on low-income, disadvantaged communities. As noted in SB 1383 (Lara, 2016): “To the extent possible, efforts to reduce emissions of short-lived climate pollutants should focus on areas of the state that are disproportionately affected by poor air quality.”</p>	<p>Comment noted. It is unclear what is the basis for the statement that the regulations do not demonstrate a nexus to public health, climate change, or emission reductions. The specific direction in statute is for CalRecycle to adopt regulations to reduce organic waste disposal to levels prescribed in statute. Designing regulations to achieve these targets will inevitably reduce emissions, reduce criteria pollutants, improve public health and reduce the impacts of climate change. The environmental and public health benefits are thoroughly documented in the Final EIR, as well as updated cost analysis in Appendix A of the ISOR. Regarding markets, procurement co-benefits the terms are vague and unclear. Finally, SB 1383 does not require this nexus. For the purpose and necessity of the regulatory provisions, please refer to the Final Statement of Reasons.</p>
4235	CRRRC South	<p>The proposed regulations do not demonstrate a <b>nexus</b> between the regulations, public health, climate change, technology advancement, markets and procurement co-benefits, and/or quantifiable emission reduction metrics for methane, criteria pollutants and other GHG gases.</p> <p>Additionally, a recent evaluation of the Cap and Trade program by the Legislative Analyst’s Office (LAO) reinforces the need for the nexus. Their report correctly observed that a lack of information about metrics and expected outcomes by agencies limits planning for programs, funding decisions, contributes to the lack of accountability of agencies overseeing the programs, and, of most importance in many cases, impacts the “goals” being obtained.</p>	<p>Comment noted. It is unclear what is the basis for the statement that the regulations do not demonstrate a nexus to public health, climate change, or emission reductions. The specific direction in statute is for CalRecycle to adopt regulations to reduce organic waste disposal to levels prescribed in statute. Designing regulations to achieve these targets will inevitably reduce emissions, reduce criteria pollutants, improve public health and reduce the impacts of climate change. The environmental and public health benefits are thoroughly documented in the Final EIR, as well as updated cost analysis in Appendix A of the ISOR. Regarding markets, procurement co-benefits the terms are vague and unclear. Finally, SB 1383 does not require this nexus. For the purpose and necessity of the regulatory provisions, please refer to the Final Statement of Reasons.</p>
4236	CRRRC South	<p>The statute’s baseline utilizing the 2014 Waste Characterization Study is problematic as it is known to be a flawed data set. With that in mind, it is troubling that a determination of a major regulatory package of this magnitude would utilize this data to implement enforcement actions and significant penalties. The release of the 2014 Waste Characterization Study was delayed due to gaps in data collection,</p>	<p>The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>especially in Southern California, as expressed by the department. When the study was released it was mentioned that it was finalized by averaging the 2008 characterization study with the 2014 waste characterization study. Clearly, this does not provide an appropriate baseline to establish accurate targets or trigger enforcement actions. The 2018 Waste Characterization Study should provide more appropriate criteria specific to SB 1383 for measurement and needs to be statutorily updated as part of the 2020 (PR Section 42653) analysis.</p>	<p>most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle's use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study. However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.</p>
4237	CRRRC South	<p>The statute is quite clear that jurisdictions may impose penalties and other regulatory mechanisms and does not require those to be implemented prior to program implementation. As a result of the flawed baseline and short timeline before a 2020 analysis or progress, it seems ill-timed to advance and codify any prescriptive enforcement regulations. Furthermore, with the permissive nature of statute, it does not seem that the state has the authority to require civil penalties on residential and commercial customers.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, "CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code." That section also provides that CalRecycle may "include different levels of requirements for local jurisdictions..."</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, "The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code." SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that "[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. '[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .'. The [administrative agency] is authorized to 'fill up the details' of the statutory scheme."</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance."</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p> <p>The enforcement provisions are included in the proposed regulations prior to the 2022 effective date in order to give jurisdictions advance notice as to regulatory requirements in order to craft local ordinances and for planning purposes. However, the commenter is correct that penalties will not be enforceable prior to the 2022 date reflected in SB 1383.</p> <p>Public Resources Code Section 42652.5(a)(1) states that the regulations may require local jurisdictions to impose requirements on generators, which include residential and commercial customers, and envisions penalties to enforce these requirements.</p>
4238	CRRC South	<p>Low Income/Disadvantaged Communities – Many of our members’ service areas are considered low income and disadvantaged communities under AB 1550, SB 535 and AB 617. The regulation does not take into account the circumstances of communities and others affected by environmental challenges. The regulations do NOT appear to reconcile and incorporate other statutes and regulations that intersect with the “real world” implementation of SB 1383</p>	<p>Comment noted. The regulations do include additional notification and outreach requirements in revised solid waste facility permitting language in the regulations.</p>
4239	CRRC South	<p>Methane Reduction – As written, AB 1383 is intended to reduce short-lived climate pollutants, such as methane. Even though methane contributes to only about 9% of the world’s Greenhouse Gasses (GHG), carbon dioxide emissions contribute to about 82%. While methane (as short-lived) can survive in the atmosphere for about 9 years, aggressive carbon dioxide will survive in the atmosphere for over 100 years. Are we sure that the answer is to put more trucks on the road to pick up three garbage cans as opposed to just one or two? We fear that some of the regulatory actions contemplated by these regulations have not been evaluated for their true environmental costs and could actually trigger increased greenhouse gases, criteria pollutants and air toxic emissions.</p>	<p>Comment noted. CalRecycle prepared an Environmental Impact Report to analyze potential environmental impacts.</p>
4240	CRRC South	<p>Working to Enhance Market Demand for Organic Materials A. Organic Procurement Goals – The California Environmental Protection Agency (CalEPA), the California</p>	<p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>Department of Resources Recycling and Recovery (CalRecycle), the California Air Resources Board (CARB), and the California Department of Food and Agriculture (CDFA) should consider working with other state offices to determine if opportunities exist to enhance state and local government procurement of compost and other value-added soil amendments, as well as biogas products for the transportation sector to help drive the market for such products. CalRecycle should consider including local government procurement requirements in its SB 1383 regulations as an additional incentive to help foster a more vibrant market for value-added organic materials products. CDFA’s Healthy Soils Initiative also holds great potential for supporting the increased application of compost on agricultural land. The state government entities listed above should work together to develop actions to provide additional incentives for the production and use of value-added organic materials products, such as compost.</p>	<p>procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding local government procurement requirements, the comment as written is ambiguous in its intent, as the current draft procurement requirements is already entirely based on local governments.</p> <p>CalRecycle participated in development and implementation of the Healthy Soils Initiative (HSI) and assisted the California Department of Food and Agriculture (CDFA) in developing reimbursable compost application rates, estimating nitrate loads following compost application, developing the HSI grant application, and including compost application as an eligible soil management practice. While CalRecycle appreciates the ability to provide input, the HSI is ultimately under the regulatory authority of CDFA, not CalRecycle.</p>
4241	CRRC South	<p>Researching Organic Materials and Energy Management Benefits – CalEPA, CDFA, CalRecycle, the State Water Resources Control Board (SWRCB), and CARB should conduct a literature review to identify existing high-quality information on economic, energy and other issues related to organic material management. The review could identify methods to quantify and monetize the benefits of using compost, mulch, digestate, and value-added soil amendment products. This could include research on using such products to enhance soil water retention, soil health, the relative levels of air pollutant emissions from producing different types of organic materials, stormwater controls, and job creation effects from creating infrastructure. As resources allow, the literature review should also identify knowledge gaps to provide direction on future research needs.</p> <p>This research could provide useful insights into how such benefits can be enhanced. It could also be used to develop plainspoken educational material describing the benefits to agricultural sectors, local governments and other entities from using organic materials.</p>	<p>Comment noted. The commenter is offering suggestions for actions outside the regulations or regulatory process.</p>
4242	CRRC South	<p>AB 939 took 15 years to implement a 50% threshold of “easier to recover materials,” whereas SB 1383 offers us a mere 9 years to implement a 75% target and a 20% edible food recovery goal. This approach “flips the entire current</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>infrastructure upside down”” with potentially major economic and systemic impacts and moves from a local approach to integrated waste management that has exhibited highly successful outcomes toward a state “command and control” system whose performance is unknown. Ironically, this comes at the very time when the market development component demands more local feedstock, local markets and local solutions.</p>	<p>provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4243	CRRC South	<p>The proposed regulation relies upon a new reporting requirement and enforcement mechanism in AB 901 (Gordon, Chapter 746, Statutes of 2015) which moves from a local reporting system to a state reporting obligation. It needs to be noted that this regulation is delayed in implementation, and comments on this regulation are due before the public knows the status of the AB 901 regulations pending at the Office of Administrative Law (OAL) awaiting a March 5, 2019 deadline. This is concerning since some of the components of AB 901 are embedded in this regulatory package, and we are responding “blindly” to this regulatory filing before the final rulemaking of AB 901 is known.</p>	<p>Comment noted. Commenter is offering an opinion on the timing of this rulemaking as related to another pending rulemaking (that was actually completed prior to the completion of the SB 1383 rulemaking).</p>
4244	CRRC South	<p>As has been expressed by CalRecycle, the success of the Short-Lived Climate Pollutants (SLCP) mandate set forth in SB 1383 will require engagement from the state, local jurisdictions, haulers, recyclers, businesses both large and small, consumers, residents, and impacted disadvantaged communities. To achieve this goal educational outreach is a critical cornerstone, and yet the regulation as designed does not sufficiently establish a “stairstep” approach to phase in this program’s many layers and evaluate progress prior to advancing the whole infrastructure. Since educational outreach is such a critical component of the success of this program, the regulation should start with this outreach and evaluate how that is progressing before phasing in other pieces of the regulation.</p>	<p>The regulations already require education; in addition, Article 14 regarding enforcement also includes provisions regarding failure to provide required education.</p>
4245	CRRC South	<p>We also note the challenge and confusion created by lumping haulers, local government and organics processors in one regulatory package.</p>	<p>Comment noted. The commenter is expressing an opinion regarding the scope of potentially regulated parties in the regulations. CalRecycle determined that the regulations needed to reach multiple regulated entities in order to achieve the goals in statute.</p>
4246	CRRC South	<p>Thus, we respectfully request that there be a more “measured” approach to this endeavor and a phase in of this regulation when the platform of infrastructure, market development and education is accomplished first.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. 4247	CRRRC South	We strongly recommend Cal Recycle convene a “stakeholder working group” with impacted parties, such as local government and our industry, to facilitate changes that can assist in achieving the metrics and goals required by the statute.	Comment noted. CalRecycle held a robust two year informal and one year formal public rulemaking process.
4248	CRRRC South	We respectfully request that CalRecycle authorize another 45 day comment period to allow the public adequate input.	Comment noted, CalRecycle held four public comment periods providing more than 100 days for public comment.
4249	CRRRC State (Lynch, K, CRRRC State)	First, we propose that programs utilizing a three-bin or two-bin system be permitted to add the volume of organic material diverted from their source separated organic container and recycling container to the overall recovery of the high diversion facility organic recovery tonnage. Many jurisdictions may use a source separated organic container to collect greenwaste, but find that food waste is better managed in the recycling or refuse container. For example, local composters may only be permitted to handle greenwaste and food waste might be better sent to an AD facility. This regulation, as currently drafted, does not allow for this crucial flexibility and discourages systems that may work better for local infrastructure.	A change to the regulatory text is not necessary. Section 17409.5.6 requires that source-separated and mixed organic waste be stored and processed separately. However, the recovered organic waste from both waste streams can be combined once sampling/measurements have taken place. The source separated organic waste is kept separate from the mixed waste stream to ensure that the maximum amount of organic waste is kept clean by reducing cross contamination so it can be recovered and not disposed. This is necessary to ensure that the organic waste recovery target established in statute can be met. In addition, combining the source separated organic waste with the mixed organic waste stream prior to sampling would skew the results to determine the facility’s efficiency to recovery organic waste from the mixed organic waste stream for recycling. Furthermore, it also provides consumers the confidence that material they consciously separated for recovery is actually recovered.
4250	CRRRC State (Lynch, K, CRRRC State)	We also recommend CalRecycle consider a secondary processing phase to meet the respective 50% and 75% recovery efficiency targets. In other words, a high diversion organic waste processing facility could meet the targets by sending their material to a secondary processor, such as a compost facility. This possibility was discussed at a stakeholder meeting with CalRecycle staff last year. At that time, staff expressed support for this concept, which would allow for the same amount of material to be diverted overall, as well as ensure that huge community investments in processing infrastructure are not left stranded.	CalRecycle staff has noted the comment. Secondary facilities (Compost/In-vessel digestion) are a part of meeting the recovery efficiency. Material processed at a transfer/processing facility must meet the incompatible material limits before it is sent to a compost or in vessel digestion facility in order for the material to be counted as recovered for the purposes of measure recovery efficiency. Compost/in-vessel digestion facilities are not required to meet a recovery rate, but instead, have a limitation on how much organic waste can be disposed. Alternatively a transfer/processor sending material to a compost/ In-vessel digestion facility that demonstrates less than 20 percent of organic waste in material it sends to disposal on and after 2022 and 10 percent on and after 2024 does not need to meet the incompatible materials limit.

Comment Number	Received From	Question/Comment	Response(s)
4251	CRRRC State (Lynch, K, CRRRC State)	<p>Finally, we think it is important to highlight the fact that international markets create unique challenges for the paper fraction of organic waste recovery. While greenwaste and food waste are managed domestically, we rely heavily on international export markets to purchase and further manage our recyclable paper. This is highly evident with the recent impact of National Sword and China's restrictions on the import of recyclable material. Given the lack of domestic markets to manage paper material, we recommend CalRecycle give special consideration to this material stream, especially if a high diversion organic waste processing facility is unable to move this material due to international market conditions. It does not assist our overall goals to shutter facilities that may not be able to move paper when all facilities are experiencing the same market conditions. Instead, we must focus on developing domestic markets for this material.</p>	<p>Comment noted. Commenter is expressing an opinion and perspective on international markets for paper and requesting CalRecycle consider those. The comment is not suggesting particular regulatory language.</p>
4252	CRRRC State (Lynch, K, CRRRC State)	<p>Sections 17409.5.2-.8 sampling  Requiring daily sampling of all organic waste types and the residual stream will be time consuming, labor intensive and could create space challenges. This will also require all operators to purchase new scales specifically for this purpose, as a the scale house is not suitable for such small weight amounts.  We support periodic sampling that will reduce overall costs and alleviate safety concerns, while providing more representative contamination data. CRRRC members are convening a working group to discuss this issue and provide a periodic sampling methodology that will provide the data you seek, while lessening the excessive burden of the proposed methodology, as currently drafted. It is critical that the methodology be operationally workable, cost-effective and protect the health and safety of our workers. We will also address what materials should count as contaminants and organics for this section.</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. This is needed to determine the efficiency of the facility in order to make required determinations in Article 3.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
4253	CRRRC State (Lynch, K, CRRRC State)	<p>Loadchecking Contamination Language  Since contamination reporting and record keeping will be required on the back end, we question why this section is necessary. Operators may choose to check incoming loads in a process that works for their operation, including informing the hauler or jurisdiction of received loads with visible contamination.</p>	<p>A change to the regulatory text is not necessary. The purpose of the gray container waste evaluations is to determine how much organic waste is present in the gray container collection stream. This is necessary to determine how effective organic waste is being recovered and use the results to gauge the accuracy of the jurisdictions container contamination minimization results that send their waste to that specific facility. The result from the above measurements independently will help provide an overview of how the jurisdictions and facilities are doing and allow to cross-check the measurements, even though it is not per jurisdiction. In addition to providing information on the type and quantities of organic waste not being recovered for possible future regulations in order to help recover those materials.</p>

Comment Number	Received From	Question/Comment	Response(s)
4254	CRRRC State (Lynch, K, CRRRC State)	Loadchecking Contamination Language While changing the record keeping from 10% contamination to visible contamination was helpful, the language still reads that operators “shall perform loadchecking to measure the amount by volume of contamination” in loads received. Not only does the volume measurement not align with the weight measurement of the sampling methodology, operators are no longer assessing the percent of contamination in incoming loads, only whether or not there is visible contamination. If this methodology remains, it should only be for whether or not there is visible contamination in a particular loadcheck. Any language referring to measuring the amount by volume should be stricken from the regulations.	CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
4255	CRRRC State (Lynch, K, CRRRC State)	Loadchecking Contamination Language Furthermore, operators that receive less than 500 tons a day should only be required to do one load check per day. Each source sector check should also be done on a monthly, not daily basis, as the previous draft language read.	CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
4256	CRRRC State (Lynch, K, CRRRC State)	Waste Collection Service Container Requirements As several stakeholders pointed out during their oral testimony during the May workshops, requiring specific colors for collection bins will be costly, as will labelling any existing containers by 2025. At a minimum, we recommend that the containers used for collection of waste, not source-separated organics or recyclables, be a color distinct from the source separated organics and recycling containers. This means a refuse container could be brown, gray, black, etc., and will slightly reduce the cost burden of replacing all containers. Staff may also consider whether simply changing the lid color would be appropriate, so perfectly viable container bodies are not discarded, adding to California’s overall waste stream. It was also noted by several CRRRC members that yellow containers will quickly become discolored and unattractive if used for the collection of food waste. Yellow also does not hold up as well in UV conditions. A yellow lid might be a good compromise.	CalRecycle revised the requirements in response to stakeholder comments, including allowing labeling only on new containers, allowing containers to phased out at the end of their useful life or by Jan. 1, 2036, the lid or the body can be the required color, and the color of the containers collection of waste is gray or black. The changes were made to be the less costly and burdensome. Based on stakeholder comments yellow is not a required container color. CalRecycle responded to stakeholders who initial had issues with the container color being yellow because yellow containers will quickly become discolored and unattractive if used for the collection of food waste; and yellow coloration does not hold up well in UV conditions. Therefore, brown was chosen because brown coloration shows dirt less; and cart manufacturers can use higher percentages of recycled plastic to make brown versus yellow containers and lids, leading to more market demand for recycled plastic.
4257	CRRRC State (Lynch, K, CRRRC State)	Waste Collection Service Container Requirements As for commercial containers, many companies use different colors so they can distinguish their containers from other providers during collection. These are also very expensive metal bins and not easily replaced. Their lifespan is also considerably longer than plastic totes. At a minimum, the container color for refuse should not be mandated. Staff should also consider whether different colored lids would be appropriate, in lieu of replacing body colors. Standardized labelling of existing commercial containers may be a	Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits

Comment Number	Received From	Question/Comment	Response(s)
		possible middle ground for consideration. Carts could be standardized as a first phase, but a commercial container program should be held over for phase 2 implementation with labelling.	in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products. Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life.
4258	CRRRC State (Lynch, K, CRRRC State)	Waste Collection Service Container Requirements While we have not done an official cost estimate analysis, some members roughly estimate that replacing California's waste collection containers would cost around \$625M.	The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement. The regulations allow labels to be applied to existing bins or lids until the containers are replaced either at the end of their useful life or by 2036. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life or by 2036. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products. Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036.
4259	CRRRC State (Lynch, K, CRRRC State)	Waste Collection Service Container Requirements Furthermore, generators should not be obligated to use the same color scheme in their business establishment if proper labelling is used. Interior design is important to business owners and requiring them to provide colored bins will likely discourage participation.	With respect to containers owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements. In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to

Comment Number	Received From	Question/Comment	Response(s)
4260	CRRRC State (Lynch, K, CRRRC State)	<p>Procurement Limitations As several stakeholders have already shared, we recommend additional procurement opportunities for renewable gas. While we strongly support the inclusion of biogas for transportation fuel, we recognize that there are other opportunities that may be more cost-effective in a particular region or location. Furthermore, the Short-Lived Climate Pollutant Reduction Strategy and the Integrated Energy Policy Report both support biogas production for a variety of end uses. We recommend CalRecycle use the same terminology for “renewable gas, including biogas and biomethane” as referenced in SB 1383. CalRecycle staff should work with CARB to identify an appropriate conversion factor for the various end uses of renewable gas.</p>	<p>meet that statute’s signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>
4261	CRRRC State (Lynch, K, CRRRC State)	<p>Procurement Limitations Additionally, we believe it is critical that the state play a role in procurement and be required to purchase the same products as jurisdictions. If CalRecycle may not have complete authority to oversee state procurement, they need to work with DGS to ensure that acquisition of this material is prioritized. Jurisdictional procurement alone will not create the markets we need to utilize material created from organics management.</p>	<p>Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor’s office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p>
4262	CRRRC State (Lynch, K, CRRRC State)	<p>Procurement Limitations Ultimately, it is the agricultural and generator sector that has the greatest purchasing power in creating and sustaining markets. While CalRecycle may not have complete authority over these sectors, they need to work closely with CDFA to help incentivize and encourage more development of organic product markets. As the utilities in California have a renewable energy procurement obligation, we need to work toward a renewable soil amendment obligation and invest heavily in supporting viable markets. Additionally, we believe the regulations need to specifically defer to CDFA and USDA for appropriate quality standards for quarantine guidance pursuant to Section 30.1 or 30.2 B. We would note that a county agricultural commissioner may not have a contract or other authority to oversee a quarantine or movement of feedstocks of organic wastes in or out of a quarantine area.</p>	<p>CalRecycle cannot impose procurement mandates on other sectors without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding working with the California Department of Food and Agriculture (CDFA), CalRecycle participated in development and implementation of the Healthy Soils Initiative (HSI) and assisted the CDFA in developing reimbursable compost application rates, estimating nitrate loads following compost application, developing the HSI grant application, and including compost application as an eligible soil management practice. While CalRecycle appreciates the ability to provide input, the HSI is ultimately under the regulatory authority of CDFA, not CalRecycle.</p> <p>Regarding quarantine guidance, Section 18983.1(b)(6)(A) refers to the land application of green waste or green material that shall have been processed at a solid waste facility as defined by Section 40194 of the Public Resources Code, if it is to count as a reduction in landfill disposal. It is the responsibility of the solid waste facility to legally comply with the movement of materials as it relates to quarantine zones. Article 3 also allows jurisdictions to dispose of quarantine material if CDFA and the agricultural commissioner requires it. The SB 1383 regulations are specifically intended to address the state’s goals for reducing organic waste disposal and the reduction of short-lived climate pollutants. While those goals may overlap with the purview of sister agencies, it is not the intent of these regulations to address every aspect of organics management throughout the state. As noted above, CalRecycle regularly works with CDFA as well as other sister agencies to ensure coordination with existing regulations and statute.</p>
4263	CRRRC State (Lynch, K, CRRRC State)	<p>Procurement Limitations CalRecycle must take markets seriously. To that end, we recommend that SB 1383 include a market development advisory body comprised of industry, commodity and other stakeholders with technical expertise to communicate with the public and policymakers on the status of markets.</p>	<p>CalRecycle generally supports open communication between all stakeholders involved, and the feedback gained through the informal and formal workshops of SB 1383 regulatory development has been instrumental in guiding the procurement requirements. Once the regulations are finalized, CalRecycle plans to develop tools and guidance for jurisdictions and other stakeholders. CalRecycle disagrees with revising the regulatory language to include a “market development advisory body” as it is unclear what distinct purpose this would serve that is not already being addressed through the rulemaking process.</p>
4264	CRRRC State (Lynch, K, CRRRC State)	<p>Procurement Limitations We also recommend in the definition and procurement section that the definition of “comparable virgin products” needs revision.</p>	<p>The term “comparable virgin products” is not found in the current version of the draft regulations. The term was introduced in previous draft language but has since been removed. Please refer to section 18993.1(j) for updated language.</p>

Comment Number	Received From	Question/Comment	Response(s)
		Watershed protection and restoration using compost is critical to further clarify this definition.	
4265	CRRRC State (Lynch, K, CRRRC State)	<p>Confidential, Proprietary or Trade Secret Data</p> <p>We are concerned that the level of information required to be provided by waste haulers and other entities may include confidential, proprietary or trade secret data that needs protection. At the outset of this regulatory process, stakeholders were given assurance that information reported to CalRecycle under the SB 1383 regulations would be managed under substantially the same process that the AB 901 regulations follow. However, while those regulations specifically state that a reporting entity is not required to designate as “protectable” certain highly sensitive information for it to remain confidential (and not subject to public disclosure) when provided to or shared by CalRecycle, these (SB 1383) regulations do not contain the same language. Protecting such information is just as vital in the context of the SB 1383 process as it was in the AB 901 regulations. We therefore urge that the draft regulations be modified accordingly. Note also that the protection must extend to information supplied to CalRecycle, or shared any other governmental agency, including local jurisdictions.</p>	<p>CalRecycle changed the requirement for a “written report” to a “written record” in 18995.1(c) to make clear that information gathered during inspections such as route reviews and compliance reviews is not required to be disclosed in a public report. These are written records that are to be maintained in the files of the local jurisdiction. To the extent that such information is valid confidential, proprietary, or trade secret information, there are protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow the appropriate withholding of such information from public disclosure by the jurisdiction.</p>
4266	CRRRC State (Lynch, K, CRRRC State)	<p>Complaints of Alleged Violations by Jurisdictions and Entities</p> <p>To avoid erroneous complaints by industry competitors and citizens, this section should include the requirement that accusations or any violation be based on “credible evidence”. This aligns with 40 CFR referenced by enforcement actions taken by USEPA and state and local enforcement actions regulating greenhouse gas and other air quality pollutants.</p>	<p>A change to the regulatory text is not necessary. Section 18995.3, Jurisdiction Investigation of Complaints of Alleged Violations, requires a jurisdiction to provide a procedure for the receipt and investigation of written complaints of alleged violations. This procedure shall require the complainant, if not submitted anonymously, to include pertinent information such as relevant facts, photos and witnesses. The jurisdiction shall use this information to determine the credibility of the evidence and if an investigation is warranted. This process is based on a long-standing model (originally implemented in 1977) for Local Enforcement Agencies responses to solid waste facility complaints. This long-standing model does not include the requirements that accusation or any violation be based on “credible evidence”. However, this section was amended during the rulemaking process to add procedural safeguards to avoid forcing jurisdictions to investigate complaints where allegations are contrary to facts known to the jurisdiction and/or the complainant fails to meet other requirements meant to ensure that a jurisdiction has a base level of information to work with.</p>
4267	CRRRC State (Lynch, K, CRRRC State)	<p>Bi-Weekly Collection, Organics Definition and Waivers Refuse containers will always contain some manner of putrescible waste, especially human and pet fecal matter. Bi-weekly collection of refuse containers could put human health and safety at risk in these circumstances and should be considered.</p>	<p>Nothing in the regulations exempts jurisdictions from existing public health and safety requirements regarding the requirement to collect waste in a manner that does not create threats to public health and safety. The language regarding collection waivers specifies that the jurisdiction must demonstrate to the enforcement agency that a collection frequency waiver will not impact the receiving solid waste facilities ability to comply with solid waste facility permitting standards related to protecting public health and safety from the handling of solid waste. CalRecycle cannot verify that a green or gray container would not include putrescible waste, it is likely that at least one container, which ever contains food will be putrescible. Which is why approval for 14 day collection is subject to review by the EA.</p>
4268	CRRRC State (Lynch, K, CRRRC State)	<p>Bi-Weekly Collection, Organics Definition and Waivers As it pertains to the definition of organics, we remain concerned that the definition is inconsistent with other statutory definitions. It also includes materials that often cannot be accepted in our</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>collection streams, such as “organic carpet and textiles”. It is not currently feasibly for a generator, curbside collector or processor to distinguish between organic and non-organic textiles and carpets without testing. This material is also potentially a physical contaminant in our organic feedstocks for composting and anaerobic digestion, threatening our ability to meet physical contamination standards. Furthermore, many technologies that manage greenwaste and food waste cannot readily accept paper waste. In other words, this definition does not readily translate to technology needs and could be confusing to the public, potentially sending the wrong signal for highest and best use for this stream. Consistency and simplicity in terminology is important as the outreach and educational component is developed with the public and other stakeholders.</p>	<p>means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Comment noted. The regulations are structured to specify material that cannot be collected in certain containers, e.g. glass cannot be collected in green containers with organic waste. Further, the regulations define organic waste however they do not specifically require organic specific materials to be collected together, e.g. the regulations do not require food and textiles to be collected together. The regulations allow jurisdictions to source separate materials that are recoverable when mixed together.</p> <p>The definition of organic waste itself does not govern how specific types of materials are handled. The definition identifies which materials are organic waste. The active text of the regulation, not the definition, controls how material is handled. Nothing in the regulatory text requires textiles or dead animals to be placed in the green container.</p> <p>Textiles and carpets are not normally accepted by organic waste recycling facilities such as composting or in-vessel facility that takes materials in green containers. However, CalRecycle included this provision allowing textiles in green containers because stakeholders during the informal rulemaking workshops requested such flexibility. CalRecycle is not aware of any compelling reason to prohibit textiles from being placed in green containers.</p> <p>While carpets and textiles may be handled in a different manner, some jurisdictions may allow them to be placed in the gray container. Carpets and textiles are allowed in the gray container regardless of where the contents of the container are subsequently managed i.e. if these are the only organic wastes allowed in the gray container the container does not have to be transported to a high diversion organic waste processing facility.</p>
4269	CRRRC State (Lynch, K, CRRRC State)	<p>Bi-Weekly Collection, Organics Definition and Waivers Finally, we note the discussion and definitions framed for waivers and exemptions but believe more clarity is needed. For example, consistency with existing definitions of disadvantaged communities will need to be considered. There are also many variables in communities that do not lend themselves to a simple population threshold. For example, we question how certain communities that have state facilities, like prisons, hospitals, or resort communities with a transient and seasonal population might be considered under the waivers and exemptions granted by the department. More clarification is needed as population numbers are calculated.</p>	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA's definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a>); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-documented history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife's black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383's organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p> <p>Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
4270	CRRC State (Lynch, K, CRRC State)	<p><b>Administrative Civil Penalties</b>  While we support enforcement provisions for SB 1383, to ensure that jurisdictions, operators, and generators comply with the intent of the law, we believe that the penalty table is premature at this juncture, without any knowledge of how the regulatory provisions will play out in the real world. We recommend that CalRecycle defer regulations on penalties, until we have viable programs in place, markets developed and a better sense of where the program successes and barriers are. At that time, the agency will have a clearer understanding of appropriate penalty levels for various infractions. This will also allow stakeholders more time to share what levels they feel are appropriate for their generators and communities.</p>	<p>A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations "may include penalties to be imposed by the Department." This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.</p>
4271	CRRC State (Lynch, K, CRRC State)	<p>First, we believe the regulations as currently drafted are overly prescriptive and potentially detrimental to current and future programs and infrastructure development. The "regulatory approach" identified assumes that a one-size-fits-all scenario will achieve the organic recycling goals outlined in SB 1383. We challenge that assumption and encourage CalRecycle staff to consider a regulatory framework with measurable performance targets based on actual capacity and available markets within given jurisdictions and communities.</p>	<p>Comment noted, CalRecycle amended the draft regulatory text to include a performance-based source separated organic waste collection service provision.</p>
4272	CRRC State (Lynch, K, CRRC State)	<p>This will require a comprehensive 2018 Waste Characterization Study, to provide an accurate baseline upon which jurisdictions can project future targets, as well as a more refined mapping tool from CalRecycle moving forward. This framework concept would allow jurisdictions, as done through AB 939, to develop their own program for organics collection and processing that is designed for their regional needs and variances.</p>	<p>Comment noted, CalRecycle performed a waste characterization study in 2018.</p>
4273	CRRC State (Lynch, K, CRRC State)	<p>Second, we understand that contamination is a significant hurdle in properly managing organics collection. How a jurisdiction and collection program manage this issue should be flexible and adjustable based on local needs. We believe a robust education and outreach program, supported by CalRecycle, is the best means of achieving reduced contamination in our programs. As mentioned in a previous letter, education should occur long before the customer is placing their organics in the appropriate container.</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization</p>
4274	CRRRC State (Lynch, K, CRRRC State)	<p>The inflexible proposed regulatory language regarding how a hauler should inspect and report contamination at the curb is problematic and puts the hauler in the position of policing customers. Jurisdictions may choose to employ comparable methods in their own agreements, but this should not be mandated at the State level. Flexibility in program design will be key to meeting the goals of SB 1383. Educational outreach should commence well before the formal implementation occurs, and we would encourage the state to reconcile the various implementation challenges and dates that might be inconsistent with the timelines anticipated in SB 1383.</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4275	CRRRC State (Lynch, K, CRRRC State)	<p>Additionally, the proposed language regarding labelling requirements is short-sighted and potentially disruptive to current and future programs. The proposed requirements do not consider different container types, sizes or even new technologies (such as barcodes for scanning). Furthermore, labelling in such a manner would cost approximately \$2 more per container, which is considerable cost for program compliance. What if images need to be altered due to market shifts or programmatic changes? The prescriptive nature of the proposed language does not guarantee that we will meet programmatic goals. Jurisdictions need the flexibility to adjust their programs based on actual capacity, infrastructure, collection methods, processing methods, and market conditions.</p>	<p>Thank you for the comment regarding the additional time, great cost savings, and easier compliance with the container color and label requirements. That comment is in support of current language.</p> <p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers' useful life or by 2036.</p> <p>A jurisdiction's designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>With respect to compactors owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements.</p> <p>In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to meet that statute's signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>In regards to the lid comment, a change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>In regards to the new technology, CalRecycle is unclear on how that will help educate the generators.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>The current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier time.</p>
4276	CRRRC State (Lynch, K, CRRRC State)	<p>Third, funding and incentives are crucial to building successful organics management programs at the local level, especially considering the education and oversight necessary to engage with regulated entities and the general infrastructure needed. Given the scarcity of facilities available to manage our organic waste stream, we will not be able to meet our 2020 diversion goal. For that reason, we must design a regulatory scheme that is supportive and supplements current infrastructure, not a punitive system that constrains the industry from achieving more. More financial support from the State is necessary.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4277	CRRRC State (Lynch, K, CRRRC State)	<p>Finally, it is essential that these regulations serve to strengthen and empower collection programs if we are to achieve our ambitious diversion targets. There is no assurance that the prescriptive language proposed will get us to our goals. The language is short-sighted and fails to capture future innovations in processing technology. In fact, some facilities currently managing organics do not fall under the identified approved facility list. Essentially, as written, these regulations would cause some facilities to no longer be a viable management option, further harming the little infrastructure currently available.</p>	<p>Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.</p>

Comment Number	Received From	Question/Comment	Response(s)
4278	CRRRC State (Lynch, K, CRRRC State)	We urge CalRecycle to initiate this program with a “good faith effort” approach to foster participation and outreach and build on a familiar and successful framework.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
4279	CRRRC State (Lynch, K, CRRRC State)	We remain concerned that the definition of Organic Waste is too broad and that not all organic feedstocks are created equal and have varying management techniques. Textiles, for example, cannot be readily accepted and processed at compost facilities. We also question the inclusion of fiber and request a more detailed definition of fiber. Does this include soiled-paper? How does fiber differentiate from traditional paper recyclables? What about the inclusion of manure and biosolids, two material types that have traditionally been managed by land application? This definition fails to capture the real-life management differences required for these varying materials. Feedstocks also have varying methane generating potential. Overall, we are concerned that the Organic Waste definition is confusing to the public who will believe their collection system should accept all these materials in one bin. Infrastructure managing certain material feedstocks, such as food scraps, requires more stringent regulatory obligations and should be incorporated into capacity planning for local jurisdictions.	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Comment noted. The regulations are structured to specify material that cannot be collected in certain containers, e.g. glass cannot be collected in green containers with organic waste. Further, the regulations define organic waste however they do not specifically require organic specific materials to be collected together, e.g. the regulations do not require food and textiles to be collected together. The regulations allow jurisdictions to source separate materials that are recoverable when mixed together.</p> <p>The definition of organic waste itself does not govern how specific types of materials are handled. The definition identifies which materials are organic waste. The active text of the regulation, not the definition, controls how material is handled. Nothing in the regulatory text requires textiles or dead animals to be placed in the green container.</p> <p>Textiles and carpets are not normally accepted by organic waste recycling facilities such as composting or in-vessel facility that takes materials in green containers. However, CalRecycle included this provision allowing textiles in green containers because stakeholders during the informal rulemaking workshops requested such flexibility. CalRecycle is not aware of any compelling reason to prohibit textiles from being placed in green containers.</p> <p>While carpets and textiles may be handled in a different manner, some jurisdictions may allow them to be placed in the gray container. Carpets and textiles are allowed in the gray container regardless of where the contents of the container are subsequently managed i.e. if these are the</p>

Comment Number	Received From	Question/Comment	Response(s)
			only organic wastes allowed in the gray container the container does not have to be transported to a high diversion organic waste processing facility.
4280	CRRRC State (Lynch, K, CRRRC State)	There is no definition for “high diversion mixed waste processing facility”. This facility needs to be defined.	<p>A change to the regulatory text is not necessary. “The term” high diversion mixed waste processing facility” is not used in the proposed regulations. The term “high diversion organic waste processing facility,” which is used is defined in Section 18982.</p> <p>A change to the regulatory text is not necessary. The term “High Diversion Organic Waste Processing Facility” refers to transfer/processing facilities that meet the 50% by 2022 or 75% by 2025 organic waste recovery efficiency standard for a mixed waste organic (MO) collection stream. The 50/75% refers to recovery of organic waste after processing of material from the MO collection stream.</p>
4281	CRRRC State (Lynch, K, CRRRC State)	What do you mean by, “has been processed by landfill disposal” as part of the definition for “residual organic waste”? How would residual material containing organics from other facilities be defined?	<p>The comment is not relevant for the following reason: The commenter has incorrectly quoted the definition for “Residual organic waste”. Below is the actual definition from the proposed regulation text. In this regard, the second question in the comment is irrelevant.</p> <p>(63) “Residual organic waste” means waste that remains after organic waste has been processed which is then sent to landfill disposal.</p>
4282	CRRRC State (Lynch, K, CRRRC State)	Commencing January 1, 2020, the use of green material as alternative daily cover does not constitute diversion through recycling per AB 1594. We note that the regulation language expands on this law and proposes that any organic waste used as ADC, AIC, or beneficial reuse will no longer count toward diversion. We question whether these regulations should be used to redefine the definition of disposal. We believe that organic waste used for beneficial reuse at the landfill, such as slope stabilization or revegetation, is a viable diversion strategy. In fact, beneficial reuse in this fashion is akin to Caltrans using this material for a similar purpose.	<p>SLCP proposed regulations is not expanding on AB 1594 or redefining the definition of disposal for purposes of that law.</p> <p>The proposed regulations allow for organic waste used at a landfill as a soil amendment for erosion control, revegetation, slope stabilization, or landscaping if the material is used in a manner that complies with Section 18983.1(b)(5).</p>
4283	CRRRC State (Lynch, K, CRRRC State)	It is important to note that land application is not defined as a “reduction of landfill disposal,” despite it being a primary management technique for biosolids, manure and compostable materials. Nor is land application defined as “landfill disposal” in the section above. This issue must be resolved moving forward. Furthermore, the facilities listed do not capture all the methods used today in managing organics. In fact, operations that qualify as “recycling centers rarely, if at all, manage organic material. Most of these facilities are buyback centers managing BCRP containers. This language is restrictive and does not consider present and future facilities process material for animal feed, as one example. End of the day, these regulations should encourage more development, not shutter facilities currently diverting and managing organics.	<p>CalRecycle concurs that maintaining flexibility for other recovery processes, not specifically identified in section 18983.1(b), which may constitute a reduction of disposal of organic waste and can achieve equivalent greenhouse house gas reduction that meets or exceeds the baseline of 0.30 MTCO<sub>2e</sub> per short ton, the proposed regulations include Section 18983.2 which provides this pathway.</p> <p>In response to stakeholder comments, Section 18983.1(b)(6) was added to clarify when the land application of organic materials counts as a reduction in landfill disposal. More specifically, section 18983.1(b)(6)(A) address the requirements for green waste applied to land, Section 18983.1(b)(6)(B) addresses biosolids applied to land, and Section 18983.1(b)(6)(C) addresses digestate applied to land.</p> <p>Section 18983.1 (b)(1) – (b)(7) clarifies what type of various activities and technologies count as a reduction in landfill disposal. Subdivision (b)(7) specifies that the lawful use of organic waste as animal feed constitutes a reduction in landfill disposal since it directly supports the state’s effort to keep organic waste out of landfills and reduce greenhouse gas emissions, and is therefore considered a recovery activity for the purposes of this regulation. Additionally, Section 18983.2 provides a pathway for determining if a technologies not specifically listed within these regulations can be deemed to constitute a reduction in landfill disposal of organic wastes to ensure flexibility and to not restrict any viable options.</p>

Comment Number	Received From	Question/Comment	Response(s)
4284	CRRRC State (Lynch, K, CRRRC State)	<p>Page 6-7, Source-separated Organic Waste Collection Service</p> <p>We take issue with this entire section in its prescriptive and restrictive nature. How a jurisdictional program collects material and labels collection containers should be determined at the local level. Some communities, for example, have already invested in split-carts to collect organic waste. This is not a one-size fits all scenario. This section alone could incur significant costs and negatively impact collection programs already in place. We suggest CalRecycle offer recommended guidelines to jurisdictions that can be used to inform program development.</p>	<p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement. The regulations allow labels to be applied to existing bins or lids until the containers are replaced either at the end of their useful life or by 2036. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life or by 2036. The regulations allow for split carts. CalRecycle understands that metal containers are likely to last longer than plastic ones. However, metal containers can be and are repainted occasionally. Repainting large, roll-off metal bins would need to comply with the VOC emission limits of the particular air district where the painting is done. VOC emissions limits in a particular air district depend on several factors, including but not limited to the size (and material) of the container, the type(s) of coating used, and the type of drying process. Based on discussions with the South Coast Air Quality Management District, which has one of the more stringent air quality standards for VOC emissions, there are appropriate paints that could be used to paint roll-offs and metal containers that would adhere to local VOC limits such as SCAQMD Rule 1125 for smaller metal containers and Rule 1107 for metal parts and products.</p> <p>Hauling industry representatives recommend a 10-year period because that is the industry standard that is built into their contracts. Regarding lids on metal containers, the regulations allow a lid to be replaced either at the end of its useful life or by 2036, which provides a less burdensome option than replacing the entire metal container. Nothing prohibits a jurisdiction from painting metal containers and lids at an earlier time. In addition, the regulations already allow containers including their lids to be replaced at the end of their useful life. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036.</p>
4285	CRRRC State (Lynch, K, CRRRC State)	<p>Page 7-8, Contamination of Source-Separated Organic Waste</p> <p>We believe jurisdictions should have flexibility in program design to address contamination management and enforcement. A command and control regulatory approach is misguided, especially given the subjective nature of the proposed language. Last year a Seattle judge ruled a new ordinance that allowed garbage collectors to look through customers' bins, to make sure food scraps were not going into the garbage, as "unconstitutional and void." The judge wrote in her decision that "the city could not explain how inspectors can compute the 10 percent limit without searching through a resident's garbage bags." We understand proposed regulatory language is for the organics bin, not garbage, but the language forces haulers to share personal customer information to jurisdictions if contaminated waste is found, which includes residential information. We are concerned about privacy violations and the State forcing haulers to police customers. Also, this methodology is also not statistically valid and will not necessarily lead to reduced contamination. This could also pose a health and safety risk to drivers if they are</p>	<p>Comment noted. CalRecycle will be conducting a statewide education campaign. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>expected to touch waste material. To address contamination issues, CalRecycle should be supporting a comprehensive statewide education and outreach plan to apprise the public of this important change in law.</p>	<p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in 31 Section 18982 (a)(65) which allows the use of cameras to determine container contamination. In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization</p>
4286	CRRRC State (Lynch, K, CRRRC State)	<p>Page 8, Mixed Waste Organic Collection Services CRRRC members across the State already engaged in organics collection employ several processing methods, including mixed-waste processing. In some cases, both source-separated materials and mixed-waste materials are managed in the same facility, supporting even higher diversion percentages than if source-separated material alone was managed. We are very concerned about the language that prohibits mixed-waste processing infrastructure to be built post 2020 with no proper analysis or explanation. This regulatory package should not be a vehicle for the CalRecycle to pick winner and loser technologies, especially when the future of these technologies is unknown. We support programs built on clear diversion targets for jurisdictions based on their feedstocks, processing capacity, and market access.</p>	<p>Comment noted. The commenter argues that the regulations must be structured in a way that protects the existing investments of their members. Specifically, the commenter is referring to collection services and material recovery facilities that were established to process mixed waste. CalRecycle has sought to address this concern in a manner that is also in compliance with the statutory targets and requirements. As noted in the Initial Statement of Reasons, which was released for public review in January of 2019: "The draft regulations originally prohibited jurisdictions from implementing new mixed waste processing systems after 2022, and required all new services to implement source-separated curbside collection as a means of ensuring that collected organic waste would be clean and recoverable. In response to stakeholder feedback, CalRecycle eliminated the prohibition on new mixed waste processing systems provided that the receiving facilities demonstrate they are capable of recovering 75 percent of the organic content received from the mixed waste stream on an annual basis."</p>
4287	CRRRC State (Lynch, K, CRRRC State)	<p>Page 8, Waivers We would like to see self-executing language whereby if a jurisdiction finds that any type of organic waste cannot feasibly be recycled, it may temporarily go to the landfill. This is important for health and safety reasons as the organic waste must go to the landfill if it has no other safe and viable alternative. Also, there is no information regarding the timeline or process for such a waiver, nor why a waiver may be disapproved by CalRecycle.</p>	<p>The regulations allow for a Corrective Action Plan (CAP) that provides additional time under specified conditions regarding delays in securing organics recycling capacity. Additionally, jurisdictions are not required to separate and recover organic waste removed from homeless encampments. While waste removed from homeless encampments or illegal disposal sites does still count as statewide disposal, the jurisdiction is allowed to dispose of the material and is not subject to enforcement for disposing of the material.</p> <p>As stated in the statement of purpose and necessity for the regulations, specifically Article 3, this regulation does not subject jurisdictions to diversion targets. This regulation cannot alter what activities count as disposal under AB 939. Comment noted. Jurisdictions are not required to</p>

Comment Number	Received From	Question/Comment	Response(s)
			pursue compliance with the collection requirements through Article 17 if the jurisdiction is not able to ensure that 90 percent of generators have service. A jurisdiction may comply through providing a collection service that complies with the requirements of Article 3 which allows jurisdictions to provide waivers, including waivers for space constraints or de-minimis material on a case-by-case basis. Regarding quarantined materials, provisions were added to state that this material is not required to be measured as organic waste if it is collected in the disposal container, or if it is disposed at a compost operation or facility.
4288	CRRRC State (Lynch, K, CRRRC State)	Page 9, Organic Waste Recycling and Education Outreach Education and outreach is a critical component to meeting our statewide diversion goals. We support education and outreach and conveying a statewide message about the law and why we are working to divert more organics from CA landfills. While we support the environmental benefits associated with this effort, siting and permitting of compost facilities has significant challenges in terms of air emissions, especially for those located in Federal nonattainment air districts. Relating the public health, safety and environmental impacts associated with the disposal of organic waste fails to address comparable issues we face in building organics management infrastructure. A Statewide public education and outreach initiative could help foster support for these facilities.	CalRecycle is providing educational materials to local jurisdictions and conducting a statewide educational campaign.
4289	CRRRC State (Lynch, K, CRRRC State)	Page 10-11, State Entities and State Facilities We are pleased to see language including State entities and facilities in these regulations. Walking the walk will be crucial in promoting statewide acceptance of organics diversion.	Comment noted. The commenter is acknowledging support.
4290	CRRRC State (Lynch, K, CRRRC State)	Page 12, Organic Waste Recycling Standards and Policies There are circumstances where a facility may no longer be able to accept organic material, therefore forcing a generator to take their material to another facility. The lower recovery rate language is confusing and does not account for extenuating circumstances where a facility may be unable to accept organic waste. This might inadvertently send more organic matter to the landfill if a facility is considered to have a lower recovery rate than the unavailable facility. We recommend this language be removed.	A change to the regulatory text is not necessary. The language referenced was included in a previous version of the regulatory text and has since been revised.
4291	CRRRC State (Lynch, K, CRRRC State)	Page 14, Planning by Cities and Counties We feel strongly that without accurate baseline information, city and counties will have a difficult time planning for organics development. We believe planning should be based off the 2018 Waste Characterization Study as the 2014 study was flawed and does not provide enough feedstock detail for jurisdictions. We also encourage CalRecycle to consider that many local government staff have never sited or permitted a solid waste facility in their lifetime. Support and guidance from the State is critical in getting the additional 200 facilities needed in place by 2025.	It is necessary to use 2014 data because the statutory diversion targets are based on a 2014 baseline.
4292	CRRRC State (Lynch, K, CRRRC State)	Page 16-17, Jurisdiction Inspection and Enforcement Requirements We note that regulated entities include all organic waste generators and that this section proposes a list of all regulated entities. Per the definition, this would include	A change to the regulatory text is not necessary. Section 18995.1 states the jurisdiction shall generate a record for compliance reviews conducted that includes a list of accounts reviewed. A compliance review shall be conducted for all solid waste collection accounts for commercial

Comment Number	Received From	Question/Comment	Response(s)
		the residential sector. Is that your intent? Also, what resources will jurisdictions get to enforce and inspect thousands of businesses? This will be a continual and substantial cost for communities moving forward.	businesses that are subject to its authority and generate two cubic yards or more per week of solid waste, including organic waste. If a jurisdiction is conducting compliance review on its residential generators to comply with organic waste generator requirements set forth in Section 18984.9(a), this record would include residential generators.
4293	CRRRC State (Lynch, K, CRRRC State)	Page 19-22, Enforcement and Penalties There is general confusion around CalRecycle’s role in enforcement for the purposes of this regulation. According to the proposed language, the Department can notice all “regulated entities” and possibly administer penalties for noncompliance. As previously indicated, the proposed regulations include subjective contamination tracking with no statistical reliability. We challenge the assumption that this methodology is sound and enforceable. We also question why enforcement at the local level is being diluted by State oversight. It was our understanding that CalRecycle would have enforcement authority over jurisdictions, and that jurisdictions would have enforcement over regulated entities in their programs.	A change to regulatory text is not necessary. The California legislature has recognized the need for the Department to have oversight and enforcement authority over jurisdictions who have a role in carrying out organic recycling requirements to meet the states mandates. This approach mirrors CalRecycle's delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Also, it is necessary that all entities that are regulated under this Chapter comply with the minimum standards to meet the state mandates. If a jurisdiction is not fulfilling its obligation to enforce the requirements, the Department may intervene and take enforcement action.
4294	CRRRC State (Lynch, K, CRRRC State)	We believe that contamination should be dealt with at the local level through their own processing agreements.	CalRecycle determined that it is necessary for statewide consistency to include provisions in the regulations to limit container contamination in order to maximize diversion on the front end.
4295	CRRRC State (Lynch, K, CRRRC State)	First and foremost, as we move forward with these regulations and consider how to achieve our ambitious goals, we must align local, regional and state objectives and obligations. Without this collaboration, we will continue to be plagued with siting and permitting issues and a lack of sustainable markets for organics diversion in certain regions. Recently SCAQMD staff, for example, urged for organic waste diversion to be used to create biofuels or zero or near-zero emission energy production such as fuel cells, rather than composting. This is because of federal nonattainment air quality concerns in the South Coast that make siting composting facilities even more difficult than in other air quality districts. To that end, the AB 1045 process needs to be expanded and should reconvene prior to the formal rulemaking of SB 1383. This is an opportunity to discuss air emissions and contamination on a regional level, from a local air district and water district perspective. Without a collaborative approach, we will have regional gaps in organics management that will prevent us from meeting our diversion goals across the State.	Comment noted. The commenter is expressing an opinion and perspective on local, regional and state collaboration as the AB 1045 process. The comment does not address particular regulatory language changes or pertain to particular regulatory procedures. .
4296	CRRRC State (Lynch, K, CRRRC State)	Additionally, as we have discussed with CalRecycle staff working on AB 901, many of the potential reporting data points are not practicable. For one, reporting tons by origin and source sector/generator type is time-consuming, labor intensive and would produce inaccurate data. We ask that CalRecycle be clear on why they are requesting certain data points. For most facilities, this would be an additional reporting burden that may not translate to increased diversion.	The purpose of the revisions to the reporting requirements for haulers is to ensure facilities are able to manage compliance with the regulatory requirements. The change requires haulers to identify, at the time of delivery to the receiving facility, the type of collection stream delivered. The purpose of the revisions to the reporting requirements for transfer/processors is to ensure each jurisdiction providing a service that combines organic waste with non-organic waste is meeting the requirements of Section 18984.1(c), 18984.2, or 18984.3 of Article 3, and transporting to a high diversion facility is meeting the 50 percent and 75 percent organic content recovery rates defined in Article 6.2 Section 17409.5.1. The purpose of the changes to the reporting requirements for composting facilities and operations is to crosscheck the percentage of organic waste in residuals. The change requires each recycling or composting facility or operation to report the monthly percentage of organic waste contained in residuals. The data required in is

Comment Number	Received From	Question/Comment	Response(s)
			<p>necessary to verify whether the facility is sending more than 20 percent on and after 2022 and 10 percent on and after 2024 of organics waste to disposal, as calculated pursuant to 17869(e)(5) or 17896.45 (a)(1)(E). For inbound organic material, the adopted AB 901 regulations already track potential beneficial reuse green material by jurisdiction of origin. Outside of the requirements that have already been adopted in the AB 901 regulations, source sector/origin data is not part of the proposed SB 1383 amendments to the AB 901 regulations.</p>
4297	CRRRC State (Lynch, K, CRRRC State)	<p>17409.5.7 loadchecking In the same vein, reporting on contamination of loads received is unworkable for many facilities. Facilities and programs may choose to do their own internal reporting on contamination, but this should not be a required reporting point. If made mandatory this would increase facility labor costs, create time constraints, and possibly endanger employees. Who pays for this additional checking and reporting, and who authorizes this activity? How will franchise agreements be affected by this effort? How will seasonal variants in contamination or regional differences be accounted for? If such a requirement is anticipated, funding will be critical to compensate for the additional time and labor to perform tracking and reporting at this level.</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
4298	CRRRC State (Lynch, K, CRRRC State)	<p>It should be noted; our facilities must manage and process material in a timely manner to meet permit requirements and agreements. Facilities should be given the flexibility to meet the goals of SB 1383 as is appropriate to their operations, facility limitations, labor concerns, finances, and business agreements. Local jurisdictions and their haulers/processors should be given the flexibility to determine how to incentivize good behavior or discourage poor behavior as it pertains to contamination by residents or commercial businesses.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4299	CRRRC State (Lynch, K, CRRRC State)	<p>Ultimately, we feel strongly that the best way to encourage contamination reduction is through education and outreach. Recycling organics will be become the new normal for California residents, and a comprehensive education and outreach program – supported by the State – will be critical. This should be a priority approach as we move forward. To that end, we recommend CalRecycle explore additional opportunities for education and outreach long before the customers place their waste items in the appropriate container. Consumer education could</p>	<p>CalRecycle is providing educational materials to local jurisdictions and conducting a statewide educational campaign.</p>

Comment Number	Received From	Question/Comment	Response(s)
		occur at retail, farmer's markets, grocery stores, schools, etc. In addition to proper organics recycling, consumers could learn how to better store their food to reduce spoilage. In this manner, CalRecycle can support upstream shifts in consumer behavior to reduce food waste and reduce overall GHG emissions.	
4300	CRRRC State (Lynch, K, CRRRC State)	We also recommend CalRecycle explore different terminology as it pertains to organics recycling. In transitioning to mandatory recycling of organics, we will need to educate all demographics, ages, cultures, etc., on how to properly manage their organic waste stream. Communities are currently grappling with what language to use, such as food scraps, organics, biodegradables, green waste, etc. This includes multi-lingual messaging. A stakeholder discussion around organics recycling terminology could help support local programs and provide continuity in messaging to support more rapid compliance and understanding across the State.	Comment noted. CalRecycle held a robust two year informal and one year formal public rulemaking process. CalRecycle will also conduct a statewide education campaign.
4301	CRRRC State (Lynch, K, CRRRC State)	Additionally, we caution CalRecycle to allow for an appropriate transition into this effort. If facilities are expected to turn loads away due to contamination, we could inadvertently encourage illegal dumping of this putrescible material. Ultimately, CRRRC members work in materials management and this material must be handled and processed properly to avoid health and safety issues. If the material is not landfilled, it must be processed elsewhere, in an appropriate manner that protects the environment and people. This regulation should serve to encourage and guard these facilities and foster consumer compliance, not hinder their capacity to manage material and encourage illegal dumping.	<p>CalRecycle staff has noted the comment. It is not the intent of these regulations to cause a transfer processing facility or operation to reject any load of waste sent to the facility. It would ultimately be up to the operator to decide what to accept or not accept.</p> <p>The requirement is if the waste is a mixed waste organic collection stream, then it must meet the recovery efficiency rate for organic waste, and the organic waste sent to a secondary facility (compost/ In-vessel digestion) for recovery needs to be less than 20 percent of incompatible material on and after 2022 and 10% on and after 2024, otherwise, there is limitations on where to send the material. Material with more than the acceptable limit of incompatible material must be sent to a Transfer/processing facility that can meet 17409.5.8 or a compost/ In-vessel digestion facility that disposes of no more than acceptable level of organic material in their residual waste stream.</p>
4302	CRRRC State (Lynch, K, CRRRC State)	<p>Strong markets would go a long way in supporting State goals for organics diversion. These markets should be developed regionally to procure material produced locally and reduce transportation costs and vehicle miles traveled. We must look at all regional costs, economic and environmental, that could affect these markets long-term.</p> <p>We strongly support State procurement of organics recycling outputs, such as mulch and compost. It is critical for the State to participate as a leading partner in the process. We can improve our examination and encouragement of this process. For example, a more-detailed analysis of Caltrans purchases broken down by category could be extremely useful to better understand current procurement practices. Same for all State agencies. We all have a crucial role to play in achieving the goals of SB 1383, and the State should serve as an example to all.</p>	<p>CalRecycle agrees. The intent of the procurement requirement is to develop regional markets for recovered organic waste products.</p> <p>Regarding mulch, CalRecycle has revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. This is an example of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p>
4303	CRRRC State (Lynch, K, CRRRC State)	<p>Data Baseline</p> <p>We remain deeply concerned about the baseline organics disposal of 5 million tons annually, as presented by CalRecycle, especially as this number does not account for biosolids, greenwaste ADC or AIC, and digestate landfilled in 2014. The 2014 Waste Characterization study was also flawed, with data skewed in Southern California.</p>	The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the

Comment Number	Received From	Question/Comment	Response(s)
		The baseline should be adjusted to include all organic material as defined by the regulations so that we can begin with an accurate and credible reference point.	most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle's use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study. However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.
4304	CRRRC State (Lynch, K, CRRRC State)	The definition of organics is a critical issue as it impacts a multitude of regulatory issues, including reporting for AB 901 and whether we are meeting the goals of AB 1826. It is imperative that this definition be aligned with these efforts, as well as work for the local jurisdictions expected to meet regulatory obligations. A consistent definition is essential to reducing confusion and supporting participation. As CRRRC staff addressed in the June 21st workshop, biosolids, sludges and digestate have not previously been defined as MSW organic waste and were not captured in the 2014 Waste Characterization study. We also question how material that has already gone through a digestive process, such as anaerobic digestion, differ or not from material that has not gone through a methane extracting process. CRRRC members have also expressed concern with the inclusion of carpet in the organics definition given that most modern carpet is synthetic in nature and already has its own Extended Producer Responsibility model for tracking and reducing this material going into the landfill. Also, most facilities are unable to accept carpet in the green bin and this creates unnecessary confusion around how the material should be managed. Textiles pose a similar issue in terms of contamination in our organic waste management streams. We encourage CalRecycle to reconsider how the aforementioned material types fit into the organics definition given the overarching goals of SB 1383 and additional regulatory obligations.	Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.
4305	CRRRC State (Lynch, K, CRRRC State)	Coupled with the organics definition, this is a critical issue that must be resolved before SB 1383 regulations are finalized. As CRRRC staff have publicly addressed, the baseline number extracted from the 2014 Waste Characterization study does not capture new material types like biosolids, sludges, and digestate that may be considered part of the organics definition. Nor did the 2014 study capture greenwaste ADC tonnages. Clearly, if we are to meet our regulatory obligations, the baseline allowable tonnage should capture the whole of organics as defined through these regulations. To that end, we recommend CalRecycle use the 2018 Waste Characterization Study (which is being re-focused to address the goals of SB 1383) to readjust the baseline tonnage for accuracy and to define an achievable goal. This adjustment would need to capture any reductions in organics to the landfill from	A change to the regulatory text is not necessary. A text change is not necessary for the following reason: As the 2018 Waste Characterization Study is still pending completion, that data is not available for consideration. However, once the data does become available, CalRecycle will use the data to help fine-tune potential goals. For the purposes of these regulations, the biosolids data were gathered from US EPA and the California Associate of Sanitation Agencies. For 2014, the reported number was 173,000 dry metric tons (ADC 113,000 and landfilled 60,000).

Comment Number	Received From	Question/Comment	Response(s)
		<p>2014 to 2018. This may require legislative, regulatory or administrative adjustments, but is imperative if we are to meet our regulatory and statutory obligations. Additionally, we encourage CalRecycle to utilize the 2018 Waste Characterization Study as an opportunity to better break down what organic material types continue to be landfilled. The 2014 Waste Characterization identifies an “other” category of 19% organic material that needs to be identified for the purposes of these regulations.</p>	
4306	CRRRC State (Lynch, K, CRRRC State)	<p>This issue will be addressed in the August 16th workshop, but at this time we recommend that any SB 1383 reporting be aligned with AB 901 reporting or otherwise. We advise against any duplicative reporting or accounting as this is costly, time-consuming and burdensome to the industry. This reporting should be streamlined and consistent with any other reporting obligations. We also need credible data to inform future policy objectives and accurately measure progress toward state environmental goals.</p>	<p>Reporting for haulers and solid waste facilities is currently aligned with the adopted AB 901 regulations. The proposed reporting requirements do not ask for data that is already reported through the AB 901 reporting requirements.</p>
4307	CRRRC State (Lynch, K, CRRRC State)	<p>17409.5.7 loadchecking While we recognize contamination is a critical issue, this should be managed at the local level as each process, collection method and jurisdiction is different. To that end, front-load checking and recordkeeping is not feasible for a variety of reasons, including cost, time limitations and safety concerns. We recommend, and will work with CalRecycle staff, to speak directly to operators of material recovery facilities to better understand how to tackle this difficult issue at the local level. Furthermore, incentives could further this effort in that reducing contamination will naturally require more processing, time and investment to reach these goals.</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p> <p>The purpose of this section is to determine how effective organic waste is being recovered and use the results to gauge the accuracy of the jurisdictions container contamination minimization results that send their waste to that specific facility. The result from the above measurements independently will help provide an overview of how the jurisdictions and facilities are doing and allow to cross-check the measurements, even though it is not per jurisdiction. In addition to providing information on the type and quantities of organic waste not being recovered for possible future regulations in order to help recover those materials.</p>
4308	CRRRC State (Lynch, K, CRRRC State)	<p>CRRRC staff have publicly addressed the concern that SB 1383 regulations, if too prescriptive, will actually do more harm than good when it comes to established infrastructure and investments. What the industry requires are more incentives, not punishment, as it pertains to better recovery rates and the reduction of contamination. This is especially important for mixed-waste processing facilities built with the intention of capturing more material to divert greater tonnages in particular jurisdictions.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This authority includes creation of rules designed to implement these statewide mandates and ensure that the statewide organic requirements are met. CalRecycle has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>The Legislature set very ambitious organic waste diversion targets in SB 1383 to be achieved on a very short timeline. As such, the provisions of the proposed regulations, while prescriptive, are designed to achieve these targets in a timely manner consistent with the statutory mandate. It is unclear how the example of diversion credit would achieve this.</p> <p>The provisions of Section 40004 are general legislative findings and declarations applying to the AB 341 (2011) mandatory commercial recycling program and not specific, affirmative legal requirements CalRecycle is required to adhere to in the proposed regulations. SB 1383 contains specific mandates on organic waste diversion that CalRecycle is required to observe in this rulemaking. The findings and declarations in Section 40004 recognize that adequate processing and composting capacity are essential for diversion and disposal reduction.</p> <p>CalRecycle does not dispute this necessity. But CalRecycle is also more specifically subject to the findings and declarations in SB 1383 (2016, PRC Section 42652) that state that the disposal reduction targets in SB 1383 are essential to achieving the statewide recycling goal of 75% in PRC Section 41780.01 and that significant investment is required to meet these goals and that state and local funding mechanisms are needed to support this expansion. The Legislature acknowledges in this section that infrastructure investment and capacity is a central issue to the success of SB 1383. Since the specific controls the general and the more recent statute controls under common rules of statutory construction, CalRecycle does not find a conflict with Section 40004.</p>
4309	CRRRC State (Lynch, K, CRRRC State)	<p>SB 1383 regulations need to account for regional differences as we move forward with diverting organics from CA landfills. Each jurisdiction has its own unique markets, infrastructure capacity, processing ability, transportation costs, and distinct generators. With the Electronic Annual Report (EAR) capturing AB 876 requirements this year, CalRecycle should perform a comprehensive analysis of current organics management capacity around the state and incorporate the realities of that infrastructure into the regulatory process for SB 1383. This may mean extended lead time, and incentive opportunities, for those communities that lack the capacity to manage organics effectively. The expression “cart before the horse” is appropriate here, should communities be enforced to collect organics long before they have the appropriate outlets to manage this material. While we commend the laudable goals of SB 1383, the reality is that landfills were built to protect human and environmental health and safety and without proper facilities to manage the material we risk disrupting this important effort.</p>	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA’s definitions (see</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p><a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a> ); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-document history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife’s black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383’s organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p> <p>Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
4310	CRRRC State (Lynch, K, CRRRC State)	Furthermore, efforts like the AB 1045 process, intended to encourage siting and permitting of facilities, has stalled with little to no efforts made. Collaborating with local air and water districts, as well as CARB and the SWRCB, is imperative if we to make tangible gains in infrastructure development. January 1, 2022 is an incredibly	Comment noted. The commenter is expressing an opinion regarding the implementation timeline for the regulations. The January 1, 2022 date is specifically reflected in statute.

Comment Number	Received From	Question/Comment	Response(s)
		short timeline given the realities of siting and permitting barriers for many communities.	
4311	CRRRC State (Lynch, K, CRRRC State)	Local control, enforcement and management of organics must be retained. This includes relationships with LEAs, local government, and public or private haulers and processors. While some stakeholders have suggested that CalRecycle directly enforce, for example, cross-jurisdictional generators, we disagree. This will only create confusion and the sharing of misinformation as we move forward with these regulations. As mentioned before, each jurisdiction has its own unique issues that need to be addressed at a local level in order to create the appropriate outreach and program development.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.
4312	CRRRC State (Lynch, K, CRRRC State)	We encourage CalRecycle to focus on the end-goal of SB 1383 with positive efforts to improve end-use markets and general market development. This is an incredible opportunity to identify challenges and opportunities to build infrastructure and manage the millions of tons of organics that would otherwise go to the landfill. This enormous task will require true collaboration across the regulatory agencies, not limited to CARB, SWRCB and CDFA. We also recommend CalRecycle stay engaged with the dairy digester research and development as that moves forward with CDFA. Ultimately, we are all working toward the goal of methane reduction and these efforts should be better synchronized as we move forward. We urge CalRecycle to avail themselves of the AB 1045 process to better collaborate with additional agencies to achieve success in diverting organics from the landfill.	Comment noted. The commenter is expressing an opinion regarding the need for end-use markets, infrastructure and collaboration but is not suggesting particular regulatory changes or commenting on the regulatory process used.
4313	CRRRC State (Lynch, K, CRRRC State)	Finally, work with disadvantaged communities and their concerns as it pertains to overall waste management must coexist with the efforts of SB 1383. CalRecycle support for education and outreach, as well as siting and permitting, will be crucial moving forward.	A change to the regulatory text is not necessary. The regulations already include provisions related to disadvantaged community engagement.
4314	CRRRC State (Lynch, K, CRRRC State)	Challenges - Regulating three sectors under one regulatory package, local government, haulers and organics processing facilities	Comment noted. Commenter is expressing an opinion regarding the sectors that are subject to the regulations
4315	CRRRC State (Lynch, K, CRRRC State)	Challenges -AB 901 reporting combined with SB 1383 reporting	Comment noted. Comment is not commenting on the regulatory language
4316	CRRRC State (Lynch, K, CRRRC State)	Challenges - Increased rate costs and impact on franchise agreements. Need assurance of rate relief.	Comment noted. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
4317	CRRRC State (Lynch, K, CRRRC State)	Challenges- Concern whether we are focusing on the correct feedstocks, when certain feedstocks produce more methane than others.	Comment noted. The regulatory text is specifically designed to prioritize or deprioritize certain types of organic waste for specific requirements. For example, organic textiles and carpet, are not subject to the same collection requirements as other types of organic waste. The prioritization reflects the portion of organic waste these materials constitute, which is small, and therefore their total methane generation potential is smaller.

Comment Number	Received From	Question/Comment	Response(s)
4318	CRRRC State (Lynch, K, CRRRC State)	Challenges - Pet waste frequently ends up in green waste containers and continues to be a challenge for the industry	If the Local Enforcement Agency determines that a material type cannot be safely recycled, then a jurisdiction would be allowed to list that material as not acceptable. Additionally, during the informal workshops many other stakeholders stated that they have programs for these material types. Further human and pet waste are not required to be measured as organic waste for the purpose of measuring contamination in 18984.5.
4319	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - Need clarification that C&D operations are excluded from these regulations	Section 18988.1 clarifies that a hauler is not subject to this section if the hauler is lawfully transporting construction and demolition debris in compliance with Section 18989.1. The regulations do require that C&D operations recycle the organic waste material that is in the C&D.
4320	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - ADC model should follow AB 1594. MRF fines, processed C&D waste materials and materials left over from the composting process (e.g. compost overs) should not could as disposal for the purposes of SB 1383.	Comment noted. The use of organic waste as alternative daily cover constitutes landfill disposal of organic waste. Language was added to clarify that use of non-organic materials does not constitute landfill disposal of organic waste. Facilities are not required to remove organic material from MRF fines. Facilities are required to sample material they send to disposal to determine the portion of organic waste they are sending to disposal. Pursuant to the sampling requirements in the regulations a representative sample of material sent to disposal must be sampled to determine the level of organic waste disposed. This includes sampling of material sent to for use as alternative daily cover. Only the organic fraction of the material sent to disposal is measured as disposal of organic waste. Language was added to clarify that disposal of non-organic materials does not constitute landfill disposal of organic waste.
4321	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - May need to add appendix with additional definitions, especially in terms of procurement material. Examples include: green infrastructure, low impact development, natural capital, ecosystem services, sustainable management practices (SMP'S), engineered soils, soil carbon storage, carbon sequestration, resilient infrastructure, and living infrastructure.	The proposed definitions are unnecessary since these terms do not appear in any meaningful way in the regulatory language
4322	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - Any complaints in terms of enforcement action need to be based on "credible evidence".	A change to the regulatory text is not necessary. Section 18995.3, Jurisdiction Investigation of Complaints of Alleged Violations, requires a jurisdiction to provide a procedure for the receipt and investigation of written complaints of alleged violations. This procedure shall require the complainant, if not submitted anonymously, to include pertinent information such as relevant facts, photos and witnesses. The jurisdiction shall use this information to determine the credibility of the evidence and if an investigation is warranted. This process is based on a long-standing model (originally implemented in 1977) for Local Enforcement Agencies responses to solid waste facility complaints. This long-standing model does not include the requirements that accusation or any violation be based on "credible evidence". However, this section was amended during the rulemaking process to add procedural safeguards to avoid forcing jurisdictions to investigate complaints where allegations are contrary to facts known to the jurisdiction and/or the complainant fails to meet other requirements meant to ensure that a jurisdiction has a base level of information to work with.
4323	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - In some cases, a three-container/four-container organic waste collection service will increase truck traffic and may be directly in conflict with state energy and emission reduction goals.	Comment noted. With respect to comments on environmental impacts these comments should be made during the appropriate comment periods associated with the Environmental Impact Report process under CEQA. The potential for any impacts on the overall GHG reductions resulting from any increase in VMT are thoroughly discussed in the Final Environmental Impact Report for this project

Comment Number	Received From	Question/Comment	Response(s)
			<p>The SRIA and the Appendix to the ISOR note that a specific increase or decrease in Vehicle Miles Traveled (VMT) could not be projected. This assessment remains true today, as noted in the Final Program Environmental Impact Report for SB 1383 Regulations—Short-Lived Climate Pollutants: Organic Waste Methane Emission Reduction:</p> <p>“Decisions by project proponents regarding the choice of compliance options and the precise location of new or modified facilities related to implementation of the proposed regulation cannot be known at this time. Furthermore, due to local planning, political (i.e., the willingness of jurisdictions to address local opposition to the siting of new or expanded facilities), and economic influences, attempting to predict project approvals about the specific location and design of facilities and operations undertaken in response to the proposed regulation would be speculative and infeasible at this stage...”</p> <p>The commenter assumes that absent an explicit calculation of VMTs, CalRecycle has failed to account for potential fuel costs associated with hauling organic material. This assumption is inaccurate. CalRecycle notes that the projected collection costs disclosed in Table 3 of the SRIA, and in Tables 7 and 8 of Appendix to the ISOR, include increased fuel costs associated with recycling.</p> <p>While this is not a direction calculation of VMT this cost does account for the costs associated with increased fuel purchases associated with increased hauling. Additionally, CalRecycle provided a cost sensitivity analysis in the Appendix to the ISOR which estimates a range of transportation costs (including fuel costs). A sensitivity analysis is provided as specific estimates of VMT would be speculative. In the Appendix to the ISOR CalRecycle notes:</p> <p>The collection costs calculated in the original SRIA, and shown in the following Collection and Processing of Organic Waste section, relied upon values derived from Cost Study on Commercial Recycling prepared by HF&amp;H Consulting and Cascadia Consulting Group for CalRecycle. The values in the cost study included fuel costs associated with collecting organic waste as a part of the total cost of collection. In this analysis, CalRecycle has additionally included data available from the cost study to project a range of potential costs associated with transporting finished products (e.g. compost, recycled paper, etc.) to market.</p> <p>While fuel costs were included in the original SRIA, this analysis shows a range of additional potential cost scenarios.</p> <p>The Cost Study on Commercial Recycling provides a statewide weighted average cost per ton for transporting a range of recovered commodities to market. The transportation costs represent the cost of delivering finished product to market. (As noted above, the fuel and transportation costs associated with collection are a part of the collection line-item shown in Collection and Processing of Organic Waste). For each material category, the per ton transportation costs include 1) base costs, 2) fuel costs, and 3) hauling costs.</p> <p>Base costs are defined as the minimum charge for picking up the materials from the processing facility. This represents the cost of loading, unloading, queuing, and a minimum travel distance of 10 miles. The fuel and hauling cost components represent the additional cost per ton per mile beyond the minimum charge. The calculator includes per ton costs for various material categories (e.g. compostables, glass, wood waste, etc.). The transportation costs were applied to the</p>

Comment Number	Received From	Question/Comment	Response(s)
			projected tons that would be recovered in each category. The Cost Study on Commercial Recycling, and the O&M costs for compost and AD derived from the SLCP economic assessment, include several similar or duplicative costs associated with collecting material from a facility. This was controlled for in the following low and medium transportation costs summaries. For each sensitivity analysis for transportation costs, slight variations were made to the calculator.” (emphasis added).
4324	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - Unclear who is expected to monitor business and property owners to ensure that are arranging for collection services and providing annual information to their “employees, contractors, tenants, and customers about organic waste recovery requirements” and “proper sorting of organic waste.”	Comment noted. In section 18995.1, jurisdictions are required to complete a compliance review of all garbage accounts for commercial business that generate two cubic yards or more per week of solid waste and produce organic waste to verify they are subscribing to service and educate organic waste generators as prescribed in Article 4.
4325	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - How is the reporting by self-haulers enforced?	Reporting for self-haulers were taken out of the regulations.
4326	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - Education and outreach efforts are a crucial component to the success of SB 1383. Especially for procurement and market development, the agency needs to coordinate with CDFA’s healthy soils program. We also need engagement with entities like the UC land-grant college statewide Cooperative Extension Program at the state and local level.	A change to the regulatory text is not necessary. A text change is not necessary for the following reason. CalRecycle generally agrees that education and outreach are crucial. Regarding coordination with other agencies, CalRecycle participates in the development and implementation of the Healthy Soils Initiative (HSI) and assists the California Department of Food and Agriculture (CDFA) in the following areas: developing reimbursable compost application rates, estimating nitrate loads following compost application, developing the HSI grant application, and including compost application as an eligible soil management practice. Regarding engaging the “UC land-grant college statewide cooperative extension program”, justifications are unclear for this recommendation since the procurement requirements are on jurisdictions, not state agencies or the University of California.
4327	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - How will edible food recovery efforts impact current or future franchise agreements? How will franchise fees be impacted?	CalRecycle cannot make a definitive statement on this because if and how franchise agreements would be impacted could vary significantly from jurisdiction to jurisdiction. Some stakeholders mentioned that some franchise haulers believe edible food is within the scope of their exclusive franchises. In the regulations the definition of edible food specifies that edible food is not solid waste if it is recovered and not discarded. CalRecycle would also like to note that SB 1383 provides a broad grant of authority to jurisdictions to “collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations...” The types of fees a jurisdiction may impose are not limited to tip fees or franchise fees. That said, some jurisdictions in California are already successfully using such fees to fund food recovery operations and activities.
4328	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - CalGreen Building Code is not updated to reflect the procurement and market aspects of SB 1383. Would be beneficial to update the Code in concert with SB 1383 regulations.	CalRecycle will provide input to the Department of General Services (DGS) on any aspects of the CalGreen Building Code requiring update as related to the SB 1383 regulations.
4329	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues- There are serious funding concerns and it appears the only established revenue stream is through enforcement, which could lead to a bounty approach between the department and local jurisdiction or other reporting entities. This is exacerbated by the lack of a “good faith effort” component to the regulations.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383

Comment Number	Received From	Question/Comment	Response(s)
			<p>furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
4330	CRRRC State (Lynch, K, CRRRC State)	Outstanding Issues - Need clarification on whether SSO can be processed with other solid waste streams (Section 17409.56)	<p>A change to the regulatory text is not necessary. Source separated organics can be processed with other solid waste streams after sampling has occurred for each waste streams. Until then, waste streams must be processed and kept separate. Otherwise, it would be hard to accurately determine the percentage of actual organic content recovered from each waste stream in order to determine if a facility is meeting the efficiency recovery requirement.</p>
4331	CRRRC State (Lynch, K, CRRRC State)	Page 87, line 3: 10 percent should be replaced with “visible contamination”	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
4332	CRRRC State (Lynch, K, CRRRC State)	Definitions - Replace recoverable with edible food as plate waste is technically edible.	<p>In an early draft of the proposed regulations edible food was defined as:  “Edible food” means unsold or unserved food that is fit for human consumption, even though the food may not be readily marketable due to appearance, age, freshness, grade, size, surplus, or other conditions. For the purposes of these regulations, “edible food” is not solid waste if it is recovered and not discarded.”</p> <p>Several commenters made the argument that this definition was too restrictive, because it described “recoverable food” not “edible food.” Commenters also raised concerns that keeping this definition would make the edible food baseline much smaller than it would be with a broader definition, and would potentially discourage donations of foods that were still safe for human consumption. To address commenters’ concerns about the definition of “edible food” being too restrictive, CalRecycle revised the definition. In the final regulations, edible food is defined as the following:  “Edible food” means food intended for human consumption.  (A) For the purposes of this chapter, “edible food” is not solid waste if it is recovered and not discarded.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>(B) Nothing in this chapter requires or authorizes the recovery of edible food that does not meet the food safety requirements of the California Retail Food Code.</p> <p>Although the final definition of “edible food” is broader than the previous draft definitions, the final definition includes language to clarify that all edible food that is recovered under SB 1383 must still meet the food safety requirements of the California Retail Food Code. This provision provides an objective standard familiar to regulated entities and eliminated the need to provide a separate definition for "recoverable food."</p>
4333	CRRRC State (Lynch, K, CRRRC State)	Definitions - Add definition of “incompatible material” (as described on page 63) to definition section	A change to the regulatory text is not necessary. The term "incompatible material" is only used in 14 CCR Chapters 3, 3.1, and 3.2 (solid waste facility and operations). This definition is applicable to activities that falls within these Chapters.
4334	CRRRC State (Lynch, K, CRRRC State)	Definitions - Definition of “non-local entity” includes “special districts,” which are considered local entities	<p>Thank you for the comment. CalRecycle revised the definition of ‘jurisdiction’ in Section 18982(a)(36) because the original term “handling” as used in the definition is overly broad. This change is necessary to provide clarity. In response to this comment, CalRecycle defined a “special district” as having the same meaning as Section 41821.2 of the Public Resources Code.</p> <p>Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a “special district that provides solid waste collection services” is a jurisdiction.</p> <p>Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction’s regulations related to solid waste. The definition of “non-local entity,” lists special districts as an example of a type of entity that could be a “non-local entity” but it does not definitively state that all special districts are non-local entities. Any special district that is a “jurisdiction” and also a “non-local entity” generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3.</p>
4335	CRRRC State (Lynch, K, CRRRC State)	Definitions - Definition of “organic waste” includes textiles and carpets, which are not required for collection programs. We need a programmatic definition of what is expected to be collected and processed, separate from the overall definition of what organic waste is methane producing.	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p> <p>Comment noted. The regulations are structured to specify material that cannot be collected in certain containers, e.g. glass cannot be collected in green containers with organic waste. Further, the regulations define organic waste however they do not specifically require organic specific materials to be collected together, e.g. the regulations do not require food and textiles to be</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>collected together. The regulations allow jurisdictions to source separate materials that are recoverable when mixed together.</p> <p>The definition of organic waste itself does not govern how specific types of materials are handled. The definition identifies which materials are organic waste. The active text of the regulation, not the definition, controls how material is handled. Nothing in the regulatory text requires textiles or dead animals to be placed in the green container.</p> <p>Textiles and carpets are not normally accepted by organic waste recycling facilities such as composting or in-vessel facility that takes materials in green containers. However, CalRecycle included this provision allowing textiles in green containers because stakeholders during the informal rulemaking workshops requested such flexibility. CalRecycle is not aware of any compelling reason to prohibit textiles from being placed in green containers.</p> <p>While carpets and textiles may be handled in a different manner, some jurisdictions may allow them to be placed in the gray container. Carpets and textiles are allowed in the gray container regardless of where the contents of the container are subsequently managed i.e. if these are the only organic wastes allowed in the gray container the container does not have to be transported to a high diversion organic waste processing facility.</p>
4336	CRRRC State (Lynch, K, CRRRC State)	Definitions - Definition of "paper products" is included as a subcomponent of "organic waste" definition and makes it appear that these products, e.g. building insulation, should be part of the recoverable organic stream in terms of collection. There needs to be a clear definition for programmatic collection items vs. procurement related items. Moreover, food soiled paper is included as part of the "organic waste" definition for AB 1826. Where do these materials fall under SB 1383?	CalRecycle recognizes that some products made from organic waste (i.e. paper products) are collected and processed differently in California. That is why the procurement requirements are separated into two components: 1) Section 18993.1 Recovered Organic Waste Products, and 2) Section 18993.3 Recycled Content Paper Procurement Requirements. CalRecycle recognizes that recovered paper flows differently from a typical food/green waste collection and processing stream, and therefore has required different elements for the procurement of end products from each stream. For example, recycled content paper is not subject to the in-state diversion requirement that organic waste is, due to the limited in-state infrastructure available for paper processing and the difficulty of verifying the paper was made from in-state recycled paper.
4337	CRRRC State (Lynch, K, CRRRC State)	Definitions - For AD operations different feedstocks are needed	Comment noted. This is not within the scope of the rulemaking.
4338	CRRRC State (Lynch, K, CRRRC State)	Paper should be in the recycling bin not organics	The regulations allow each jurisdiction to decide which recycling container to place paper in. This provision was included in response to previous comments from jurisdictions about the need for such flexibility.
4339	CRRRC State (Lynch, K, CRRRC State)	Definitions - Wood needs further delineation such as untreated wood	<p>The regulations already allow organic waste, which can include non-hazardous wood and dry lumber, to be included in the green container. The regulations also already allow for non-hazardous wood and dry lumber to be included in the blue container.</p> <p>Regarding treated hazardous wood waste, CalRecycle revised Section 18984.1 to add a new subsection indicating that this material should not be allowed in the blue container.</p>
4340	CRRRC State (Lynch, K, CRRRC State)	Definitions - Definition of "prohibited container contaminants" appears to prohibit plastic bags when some collection methods utilize bags to separate green waste from food waste, as an example. Prohibited contaminants will likely be programmatic specific by collection program and require more flexibility.	Comment noted. Many facilities find use of plastic bags in a green container collection streams to be a viable and cost-effective method for recovery organic waste. The regulations specify that the receiving facility must certify that it can process and remove the bags, if the jurisdiction allows bagged collection. Bags are allowed in the three or two container systems as long as the facility can process and remove the bags.

Comment Number	Received From	Question/Comment	Response(s)
		o This section also requires additional language that is consistent with USDA and CDFA quarantine standards.	CalRecycle acknowledges that non-compostable plastic bags can cause problems if not properly managed. The regulations as written allow non-compostable bags to be used as long as the receiving facility can recover the material or similar to other plastic bags the material can be removed as a contaminant from the recovery process. Nothing precludes the jurisdiction from prohibiting non-compostable plastic bags, requiring clear bags, requiring compostable plastic to meet third party requirements, or requiring compostable plastic bags to meet requirements beyond those in Sections 18984.1(a)(1)(A) and 18984.2(a)(1)(C). A facility will not be 'punished' if it chooses to not accept bags, and that plastic bags will not be considered organic waste themselves. The language requires jurisdictions to receive positive notification from the facility indicated that it will accept plastic bags.
4341	CRRC State (Lynch, K, CRRC State)	Definitions - Add definition of "reuse" and "remanufacturing"	Comment does not specifically identify where additionally clarity is needed for textiles and carpets. "Incompatible materials" is defined in Section 17402, "reuse" is an existing regulatory term, it is not added or used in these regulations, the term "remanufacturing" is not used in the regulation.
4342	CRRC State (Lynch, K, CRRC State)	Definitions - Definition of "renewable natural gas" should be consistent with PUC definition and policy goals	The definition of "renewable gas" in the proposed regulatory text is intentionally limited to the provisions of these regulations and the purpose of SB 1383 statute. This definition does not prevent other agencies from defining "renewable natural gas" or "renewable gas" for a different purpose.
4343	CRRC State (Lynch, K, CRRC State)	Definitions - Add definition of "Organic Waste Hauler"	CalRecycle revised the title of Section 18988.2 in response to this comment even though the regulations already have a sufficient definition of 'hauler.' However, Section 18988.2 had the title of 'Organic Waste Hauler Requirements,' even though the term 'organic waste hauler' is not used anywhere else; there is no need for a definition entitled 'organic waste hauler.'
4345	CRRC State (Lynch, K, CRRC State)	Definitions - Need to cross reference the PRC # S40171 to include the definition of pollution	CalRecycle has noted the comment. This is not within the scope of this rulemaking.
4346	CRRC State (Lynch, K, CRRC State)	Landfill Disposal - Watershed protection and stormwater protection that have water related benefits should be added as an activity that constitutes a reduction of landfill disposal	The application of organic waste products is allowed per Section 18983.1(b)(6) as long as it complies with minimum standards of 14 CCR Section 17852(a)(24.5) to ensure the material is used in a manner that is protective of public health and the environment, supports the state's effort to keep organic waste out of landfills and reduces greenhouse gas emissions. In addition, Section 18983.1(b)(5) addresses allowing organic waste products to be used as a soil amendment for erosion control, revegetation, slope stabilization, or landscaping at a landfill.
4347	CRRC State (Lynch, K, CRRC State)	Landfill Disposal - Emergency use, such as post-fire application of compostable material, should be added as an activity that constitutes a reduction of landfill disposal	A change to the regulatory text is not necessary. A text change is not necessary for the following reasons: In the Initial Statement of Reasons, Section 18983.1 Landfill Disposal and Recovery, it is clearly outlined that organic waste that used in land application, regardless if it is fire-related or not, is counted as landfill reduction. Section 18983.1 Landfill Disposal and Recovery, Subdivision (b)(5)(A)-(D) outlines land application, which would include "Emergency use, such as post-fire application..." of organic waste even though not explicitly stated. Subdivision (b)(5) states that: "...this section is to specify that organic waste used as a soil amendment for erosion control, revegetation, slope stabilization or landscaping is considered a recovery activity for the purpose of this regulation, provided that certain conditions mitigating greenhouse gas emissions relative to the material's final deposition are met. This section also outlines specific conditions for these

Comment Number	Received From	Question/Comment	Response(s)
			<p>applications. Since these activities, under the circumstances prescribed in this section, can reduce in greenhouse gas emissions, this supports the state’s efforts to keep organic waste out of landfills and reduce greenhouse gas emissions, and is therefore considered a recovery activity for the purposes of this regulation.”</p>
4348	CRRRC State (Lynch, K, CRRRC State)	<p>Landfill Disposal - ADC that counts as disposal should follow AB 1594. “Green material” has the same meaning as “processed green material.” The term does not include materials left over from the composting process, materials left over after the material recovery process (commonly referred to as “fines”), or processed construction and demolition waste materials.</p>	<p>A change to the regulatory text is not necessary. The comment is not relevant for the following reason(s): As stated in the Initial Statement of Reasons, Section 18983.1 Landfill Disposal and Recovery, Subdivision (a)(2)...“The purpose of this section is to specify that organic waste used as alternative daily cover (ADC) or alternative intermediate cover (AIC) at a landfill will be considered a landfill disposal activity for the purposes of this regulation.”</p> <p>Regarding the commenters note on “Green Material”. For the purposes of ADC in these regulations, “green material” is defined in Section 20690 of Title 27 of the California Code of Regulations.</p>
4349	CRRRC State (Lynch, K, CRRRC State)	<p>Carts/Containers - Gray containers/carts should be allowed as a color option with a definition</p>	<p>The definition of gray container in Section 18982(28) already specifies either gray or black. The term “black container” is not used in the regulation.</p>
4350	CRRRC State (Lynch, K, CRRRC State)	<p>Carts/Containers - How will split carts/containers distinguish paper fraction if both lids are to be blue?</p>	<p>CalRecycle revised Section 18984.7(a) in response to this comment to clarify that jurisdictions have to provide containers for the collection service that the jurisdiction implements for organic waste generators, not the indoor bins of businesses. Sections 18984.1(a)(6)(B) and (C) and 18984.2(d)(1) do not require that only light and dark blue be used for a split container; they allow any color not already designated for other materials specified in this section to be used for the split container. Additionally, if the color is an issue in this circumstance, the business can use labels instead. CalRecycle will clarify in the FSOR that Section 18984.9(b), which allows a commercial business to provide containers that comply with either the color or the labeling requirements, applies to Section 18986.1 and Section 18986.2.</p>
4351	CRRRC State (Lynch, K, CRRRC State)	<p>Carts/Containers - Commercial containers should be distinguished from residential carts in regulation language. May require different labelling and coloring requirements (e.g. do commercial containers require colored lids when the majority are currently black?) and regulatory timelines.</p>	<p>The regulations apply to both residential and commercial containers. CalRecycle has provided flexibility regarding containers regardless of commercial or residential. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement. The regulations allow labels to be applied to existing bins or lids until the containers are replaced either at the end of their useful life or by 2036. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life or by 2036.</p>

Comment Number	Received From	Question/Comment	Response(s)
4352	CRRC State (Lynch, K, CRRC State)	Carts/Containers - Industry believes yellow carts stain easily and have less UV protection and may be a poor option for food waste collection.	CalRecycle responded to stakeholders who initial had issues with the container color being yellow because yellow containers will quickly become discolored and unattractive if used for the collection of food waste; and yellow coloration does not hold up well in UV conditions. Therefore, brown was chosen because brown coloration shows dirt less; and cart manufacturers can use higher percentages of recycled plastic to make brown versus yellow containers and lids, leading to more market demand for recycled plastic. The jurisdiction would be able to continue to use the brown containers for manure until they reach the end of their useful life or until 2036, whichever comes first.
4353	CRRC State (Lynch, K, CRRC State)	Carts/Containers - Concern that there is not enough cart manufacturing supply to meet the demand of these regulations as currently drafted.	The comment is speculative, however CalRecycle extended the container color compliance date out until 2036 in response to this and other comments. Further a jurisdiction could be place on a corrective action plan if extenuating circumstances exist.
4354	CRRC State (Lynch, K, CRRC State)	Carts/Containers - Unused carts will need to be landfilled and create a large waste stream	Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container.
4355	CRRC State (Lynch, K, CRRC State)	Carts/Containers - There exist building code restrictions on design/color that may make color requirements difficult to implement at the commercial level	State law would preempt local regulation under these circumstances. Article 11, Section 7 of the California Constitution provides that “a county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws.” To the extent that local ordinances conflict with state requirements, they would be preempted. See eg. City of Riverside v. Inland Empire Patients Health & Wellness Center, Inc. (2013) 156 Cal.Rptr.3d 409, 56 Cal.4th 729, 300 P.3d 494. Building codes and HOAs cannot be in conflict with local, state, or federal law. Stakeholders raised concerns raised that the regulations may be in conflict with local building codes and possible restrictions on design/color and other aesthetic requirements, for example in resort communities and jurisdictions with unique climates that require special considerations. However, if a HOA’s CC&Rs require use of a particular container color that is not in compliance with these requirements, then the CC&Rs would be in conflict with state law and any local ordinances adopted by jurisdictions pursuant to these regulations. The same would apply to a building code established by a jurisdiction.
4356	CRRC State (Lynch, K, CRRC State)	Carts/Containers - May consider biodegradable bags or separate plastic bags for collection of organics at the commercial level that is not collected in a cart or container.	if the commenter is suggesting that bags be used for food waste without being placed in a cart, the regulations do not provide that as an option. Greenwaste may be uncontainerized. The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility’s normal operating procedures. CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.

Comment Number	Received From	Question/Comment	Response(s)
			<p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.</p>
4357	CRRRC State (Lynch, K, CRRRC State)	Carts/Containers - Providing containers for collection of organic waste and recyclables in all areas where disposal containers are provided for customers is not feasible in all spaces, such as restrooms.	Section 18984.9(b)(1) requires placement of containers in all areas except restrooms but does not prohibit a jurisdiction from also placing in containers in restrooms. Section 18990.1(a) already indicates that a jurisdiction can implement more stringent requirements. Therefore, if a jurisdiction's programs support composting certain types of materials discarded in restrooms, the jurisdiction is free to add these to its program.
4358	CRRRC State (Lynch, K, CRRRC State)	Labelling - Labelling date requirements differ from color requirements. Some recommend replacing labels on existing carts/containers by January 1, 2032 or whenever the container is replaced by a new container.	Comment noted. A Specific requirement is not necessary, nothing in the regulations prevents this from being done.
4359	CRRRC State (Lynch, K, CRRRC State)	Labeling - Regulations are unclear whether labels are intended to show all accepted/prohibited materials vs. primary accepted/prohibited materials. Showing all is impossible in written or graphic form. Alternate languages could be provided to consumers in print or online form.	For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.
4360	CRRRC State (Lynch, K, CRRRC State)	Procurement - Add stormwater treatment and watershed improvement as option for procurement regarding compostable material (e.g. compost filter socks, compost blankets, etc.)	CalRecycle disagrees with this proposed revision because nothing in the draft regulatory text prohibits the use of the compost products listed in the comment (compost filter socks, compost blankets) as long as the compost in those products meets the definition of compost, per Section 17896.2(a)(4), and is produced either at a compost operation or facility or large volume in-vessel digestion facility that composts on-site (refer to Section 18993.1(f)(1)(A) and (B). Biosolids and/or digestate that do not meet the compost definition will not count towards the procurement target.
4361	CRRRC State (Lynch, K, CRRRC State)	Procurement - Need to build out a definition of compost uses and compost and product uses for procurement and incorporate throughout the regulations with the definition of pollution in Articles 2, 8, 9, 12 and 13	CalRecycle disagrees with this proposed revision because the draft procurement requirements are not intended to mandate compost end uses. A jurisdiction has the flexibility to use compost for its local needs, which could be as varied as erosion control, school and community gardens, or a compost giveaway. It is overly burdensome and not feasible to list all the possible compost uses in the regulations. However, CalRecycle does plan to provide tools and resources for jurisdictions once the regulations are finalized, which could include examples of compost use. Regarding the "definition of pollution" and reference to other articles, the comment's intent is unclear, however

Comment Number	Received From	Question/Comment	Response(s)
			the procurement requirements are designed to complement the requirements in other sections of the draft regulation.
4362	CRRRC State (Lynch, K, CRRRC State)	Procurement - Should include language around "fair market value" on an annual basis	CalRecycle declines to include language pertaining to "fair market value" because there is no justification provided in the comment, or otherwise, for doing so.
4363	CRRRC State (Lynch, K, CRRRC State)	Procurement - Eliminate complicated tracking and formulas	Quantifiable and measurable methods to verify procurement of recovered organic waste product and recycled content paper procurement are necessary to ensure that CalRecycle can verify compliance with the minimum requirements of SB 1383. Compliance with SB 1383 is necessary to achieve the ambitious organic waste diversion goals required by SB 1383. Given that no alternatives for quantifying the procurement requirements are provided in the comment, CalRecycle declines to revise the regulatory language in response.
4364	CRRRC State (Lynch, K, CRRRC State)	Procurement - Need to determine an equitable procurement target for all jurisdictions. Current formula is not equitable.	The intent of the procurement requirements is to provide a fair and transparent method to quantify and measure procurement of recovered organic waste products. For example, the procurement target is based on publicly available population data provided by the Department of Finance (DOF) and the amount of statewide organics diversion necessary to meet the 2025 target. Given that no alternatives are provided in the comment, CalRecycle declines to revise the regulatory language in response.
4365	CRRRC State (Lynch, K, CRRRC State)	Procurement - Should include all uses of RNG, including electricity production	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends</p>

Comment Number	Received From	Question/Comment	Response(s)
			electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.
4366	CRRRC State (Lynch, K, CRRRC State)	Procurement - State agencies should also be required to procure!	<p>Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor’s office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p>
4367	CRRRC State (Lynch, K, CRRRC State)	High Diversion Organic Waste Processing Facility - Should be able to combine the diversion tonnages of their SSO and recyclables to achieve the desired recovery rates, in a three-container or two-container collection system.	A change to the regulatory text is not necessary. The source separated organic waste is kept separate from the mixed waste stream to ensure that the maximum amount of organic waste is kept clean by reducing cross contamination so it can be recovered and not disposed. This is necessary to ensure that the organic waste recovery target established in statute can be met. In addition, combining the source separated organic waste with the mixed organic waste stream prior to sampling would skew the results to determine the facility’s efficiency to recovery organic waste from the mixed organic waste stream for recycling. Furthermore, it also provides consumers the confidence that material they consciously separated for recovery is actually recovered.
4368	CRRRC State (Lynch, K, CRRRC State)	High Diversion Organic Waste Processing Facility - Consider a secondary processing phase (e.g. compost) to meet the desired recovery rates	CalRecycle staff has noted the comment. Secondary facilities (Compost/In-vessel digestion) are a part of meeting the recovery efficiency. Material processed at a transfer/processing facility must meet the incompatible material limits before it is sent to a compost or in vessel digestion facility in order for the material to be counted as recovered for the purposes of measure recovery efficiency. Compost/in-vessel digestion facilities are not required to meet a recovery rate, but instead, have a limitation on how much organic waste can be disposed. Alternatively a transfer/processor sending material to a compost/ In-vessel digestion facility that demonstrates

Comment Number	Received From	Question/Comment	Response(s)
			less than 20 percent of organic waste in material it sends to disposal on and after 2022 and 10 percent on and after 2024 does not need to meet the incompatible materials limit.
4369	CRRRC State (Lynch, K, CRRRC State)	High Diversion Organic Waste Processing Facility - More clarity is needed on what material is considered a mixed waste organic collection stream. For example, debris boxes and self-hauled public contractor material should not fall under this category. Many jurisdictions have 3-cart system but may have separate line to manage debris boxes and material brought from self-haulers (like public contractors) and will pull out organics from this stream. This material should not be considered mixed waste organic collection stream.	CalRecycle staff has noted the comment. To clarify, construction and demolition debris that is separated at the point of generation, kept separate, and sent to permitted construction and demolition debris transfer/processing facility or operation that meets the California Green Building Code would not be required to meet the recovery rate of 50 percent by 2020 and 75% by 2025. However, construction and demolition debris that is comingled with other waste streams would be handled as a mixed waste organic collection stream.
4370	CRRRC State (Lynch, K, CRRRC State)	Reporting/Recordkeeping -Organic waste that is used as animal feed should be reporting under SB 1383	Comment noted. CalRecycle has determined that use as animal feed counts as a reduction in landfill disposal but finds that reporting for use as animal feed is unnecessary.
4371	CRRRC State (Lynch, K, CRRRC State)	Reporting/Recordkeeping - Will the recordkeeping requirement by container contamination minimization be summarized in the jurisdictions annual report (Article 3 Section 30.6)?	A change to the regulatory text is not necessary. Please see Section 18994.2(c).
4372	CRRRC State (Lynch, K, CRRRC State)	Waivers - Physical space waivers o Where the customer may only have space for two carts, which container is placed (organic or recyclable)? The regulations don't currently address this issue. o Concern expressed that this may be an easy way for generators who should have a collection program to get out their requirements	Discretion is left to the jurisdiction as to whether to waive some or all of the organic waste collection requirements under a physical space waiver.
4373	CRRRC State (Lynch, K, CRRRC State)	Waivers - Concern expressed that the de minimus waivers could impact route efficiency and collection opportunities.	Comment noted. The comment is not suggesting a particular language change or commenting on the rulemaking procedure used.
4374	CRRRC State (Lynch, K, CRRRC State)	Waivers - As expressed in a previous CRRRC letter, there will always be potential fecal matter in the refuse bin and therefore a less frequent collection waiver than required by Section 17331 of Title 14 of the California Code of Regulations could pose serious health and safety risks.	Nothing in the regulations exempts jurisdictions from existing public health and safety requirements regarding the requirement to collect waste in a manner that does not create threats to public health and safety. The language regarding collection waivers specifies that the jurisdiction must demonstrate to the enforcement agency that a collection frequency waiver will not impact the receiving solid waste facilities ability to comply with solid waste facility permitting standards related to protecting public health and safety from the handling of solid waste. CalRecycle cannot verify that a green or gray container would not include putrescible waste, it is likely that at least one container, which ever contains food will be putrescible. Which is why approval for 14 day collection is subject to review by the EA.
4375	CRRRC State (Lynch, K, CRRRC State)	Waivers - How are low income communities factored into waivers or exemptions granted by the department?	CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers. CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount

Comment Number	Received From	Question/Comment	Response(s)
			<p>of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state.</p> <p>Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations &gt; 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA's definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a>); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.</p> <p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-document history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife's black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>achieving SB 1383's organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p> <p>Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.</p>
4376	CRRRC State (Lynch, K, CRRRC State)	Waivers - How are resort communities or those areas with varied seasonal populations factored into waivers or exemptions granted by the department?	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers.</p> <p>CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. 4377	CRRRC State (Lynch, K, CRRRC State)	Waivers - Population criteria may not be helpful in some cases such as small communities that house a state facility, such as a prison, that are technically exempted from collection programs.	<p>CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection.</p>

Comment Number	Received From	Question/Comment	Response(s)
			Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals.
4378	CRRRC State (Lynch, K, CRRRC State)	Waivers - Need an option to renew an “emergency processing facility temporary equipment or operational failure waiver”.	<p>CalRecycle does not concur with changing the language to ‘shall’ as there may be instances where a jurisdiction wants the material to be taken to another facility for recycling rather than disposing of the material. It is unclear why CalRecycle would require the disposal of organic waste. If a processing issue extends beyond 90-days a jurisdiction could seek additional time under a corrective action plan for extenuating circumstances.</p> <p>CalRecycle does not concur with the addition of a new waiver because planned and routine maintenance should already be accounted for and the material should not be disposed.</p>
4379	CRRRC State (Lynch, K, CRRRC State)	Collection - Need to have the option to use plastic bags for separating materials within organic or recyclable bin. One example is food waste separated from greenwaste, or textiles separated from recyclables.	<p>Bags may be used in the green container under certain circumstances. Bags may be used in the blue or gray container without any additional requirements unlike for the green container. The facility would notify the jurisdiction that it no longer accepts compostable plastics. A facility accepting these materials would typically notify the jurisdiction as part of the facility’s normal operating procedures.</p> <p>CalRecycle already revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>The regulatory language already allows plastic bags to be removed. For any plastic bags, including compostable plastic bags, a facility receiving such material will have to notify the appropriate jurisdiction that compostable plastics will not be recovered at the facility.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.</p>
4380	CRRRC State (Lynch, K, CRRRC State)	Route Review (Container Minimization) - Collection programs should have the flexibility to design their route reviews according to their individual programmatic needs	Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a

Comment Number	Received From	Question/Comment	Response(s)
			<p>volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4381	CRRRC State (Lynch, K, CRRRC State)	Route Review (Container Minimization) - As currently drafted, this section is not practicable and economically unfeasible, especially in terms of enforcement expectations.	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. 			<p>what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
4382	CRRRC State (Lynch, K, CRRRC State)	Route Review (Container Minimization) - Feel strongly that this section should be made more flexible overall and that jurisdictions can submit a route review plan as part of their program planning. No need for this prescriptive approach!	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p>

Comment Number	Received From	Question/Comment	Response(s)
			In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.
4383	CRRRC State (Lynch, K, CRRRC State)	Route Review (Container Minimization) - If no flexibility language is added, language should read "significant prohibited contamination" in lieu of "prohibited container contaminants".	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. 4384	CRRRC State (Lynch, K, CRRRC State)	Enforcement - General concerns that this is the only way the department appears to receive revenue for program implementation.	Comment noted. This comment is not recommending a change to the regulatory text.
4385	CRRRC State (Lynch, K, CRRRC State)	Enforcement - Need clarification that if a jurisdiction is under a "Corrective Action Plan" they may not be implementing all the required programs and therefore would not need to enforce on other reporting entities or generators.	A change to the regulatory text is not necessary. Section 18995.4 (b)(2) allows for an extension if an entity's compliance is not possible due to limitations in infrastructure and the jurisdiction is on a Corrective Action Plan.
4386	CRRRC State (Lynch, K, CRRRC State)	Enforcement - Concern that 90 days is insufficient for a jurisdiction to correct ordinance program deficiencies	CalRecycle has revised section 18996.1(e) in response to this comment. The change increases the relevant timeline to 180 days.
4387	CRRRC State (Lynch, K, CRRRC State)	Enforcement - Does department access for inspection include haulers, MRFs, compost facilities, etc.? May need a reasonable notice component, like 72 hours.	A change to the regulatory text is not necessary. Section 18996.4 states that an authorized Department employee or agent may enter the premises of any entity subject to this chapter. Haulers, material recovery facilities, compost facilities and other solid waste facilities are regulated under other chapters of Title 14. Those provisions are not subject to this rulemaking process.
4388	CRRRC State (Lynch, K, CRRRC State)	Enforcement - Department enforcement action for state agencies and local education agencies is insufficient as the only outcome is being listed on the Organic Waste Recovery Noncompliance Inventory.	A change to the regulatory text is not necessary. Under 1383, state agencies are treated as generators rather than implementation authorities and SB 1383 did not authorize the Department to issue penalties to state agencies. The Department will not be adding enforcement

Comment Number	Received From	Question/Comment	Response(s)
			requirements on state agencies. Section 18996.6 states that the Department will oversee the compliance of state agencies in respect to SB 1383. Currently, state agencies are required to meet waste diversion goals like those required for cities, counties and regional agencies under AB75. State agencies and large state facilities must adopt integrated waste management plans, implement programs to reduce waste disposal and they have their waste diversion performance annually reviewed by the Department.
4389	CRRRC State (Lynch, K, CRRRC State)	Organic Waste Recovery Efficiency - A source separated paper collection program should NOT be required to do contamination testing. If required, this should only be greenwaste/foodwaste, etc.	Comment noted. A receiving facility (organic waste recovery activity) are not required to meet a recovery rate, but instead, have a limitation on how much organic waste can be disposed. A compost/ In-vessel digestion facility should have no more than 20 percent of organic waste sent to disposal on and after 2022 and 20 percent on and after 2024. A paper recycling center (organic recycling centers) are required to meet the requirements of a recycling center as set forth in Section 17402.5 (d).
4390	CRRRC State (Lynch, K, CRRRC State)	Organic Waste Recovery Efficiency - A daily testing of contamination is overly burdensome and will be a huge cost to operating entities, as well as time consuming, a space constraint issue and potentially dangerous for operations. At a maximum a facility could test for one week during the quarter to determine the average quarterly sum of outgoing organic waste sent for disposal and the residuals left over in the various organic waste types. Periodic sampling, not daily sampling, is necessary.	CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative. The measurement protocol is necessary to determine the level of efficiency of a facility to separate organic material for recycling. The operator will now be taking composite samples for 10 consecutive days per reporting period. Using 10 consecutive days instead of daily will help minimize concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data. Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.
4391	CRRRC State (Lynch, K, CRRRC State)	Organic Waste Recovery Efficiency - It is particularly confusing and unclear how a composting facility will be expected to test a sample from each organic waste type. There is no explanation of what constitutes end-use, further recovery or further processing. In addition to the need for periodic testing, composting and AD facilities should have a process specific sampling methodology that works for their operations. This is assuming that MRFs, compost facilities and AD facilities all process organics similarly, which is simply not the case.	A change to the regulatory text is not necessary. An activity that further processes recovered organic waste pursuant to Section 18983.1 (b) would constitute an end-user processor (composting/in-vessel digestion, or recycling center are some examples). A composting facility only needs to sample the residual waste, not each organic waste type, to determine the amount of organic waste sent for disposal. Section 17867(a)(16) requires operators to take a sample that is representative of a typical operating day, and a random, composite sample taken from various times during the operating day or locations within the pile after processing. Composting facilities are not required to meet a recovery rate, but instead, have a limitation on how much organic waste can be disposed. In addition, operators can propose an alternative sampling protocol with approval by the EA and concurrence from CalRecycle.
4392	CRRRC State (Lynch, K, CRRRC State)	Organic Waste Recovery Efficiency - Clarification is needed for preprocessing of organic material prior to going to AD. Again language is very unclear where in the process contamination will be checked. Need to separate out MRF from compost to AD facility expectations.	A change to the regulatory text is not necessary. An activity that further processes recovered organic waste pursuant to Section 18983.1 (b) would constitute an end-user processor (composting/in-vessel digestion, or recycling center are some examples). A composting facility only needs to sample the residual waste, not each organic waste type, to determine the amount of organic waste sent to disposal. Section 17867(a)(16) requires operators to take a sample that is representative of a typical operating day, and a random, composite sample taken from various

Comment Number	Received From	Question/Comment	Response(s)
			times during the operating day or locations within the pile after processing. Composting facilities are not required to meet a recovery rate, but instead, have a limitation on how much organic waste can be disposed. In addition, operators can propose an alternative sampling protocol with approval by the EA and concurrence from CalRecycle.
4393	CRRRC State (Lynch, K, CRRRC State)	Organic Waste Recovery Efficiency - Also, very unclear how operators are expected to remove organics that are stuck to plastics or how to manage wet vs. dry processes. Wet processes will obviously weigh more and therefore have different outcomes in terms of "contamination" that is determined by weight.	CalRecycle staff has noted the comment. The purpose of this regulation is not to describe the means and methods for which to effectively remove all contamination in a source-separated or mixed waste collection system, but to measure how efficient the facility is at recovering organic waste from these waste streams. The measurement protocol requires operators to take a sample representative of a typical operating day, and a random, composite sample taken from various times during the operating day or locations within the pile after processing. This protocol will be leveling the daily variations and provide a more representative weight.
4394	CRRRC State (Lynch, K, CRRRC State)	Loadchecking Contamination - No need to include this section as part of the regulatory package as already part of Title 14 loadchecking program protocol. • Facilities are already doing their part to meet Title 14 and 27 requirements and no need for prescriptive approach in the regulations.	CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations under Section 17409.5.7 in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
2022	Cummings, Dan; Sevana BioEnergy	Sevana Bioenergy is a developer of Anaerobic Digestion (AD) facilities that produce Renewable Natural Gas. We applaud the State's work in this area. In the general comment section of today's public hearing on regulations for SB 1383, we would encourage CalRecycle to ensure that the new regulations are technology neutral to ensure that new technologies that are coming in the future are encouraged and not blocked from qualified sources of methane reduction.	CalRecycle agrees that determinations of new technologies and processes should be technology neutral but clarifies that they cannot be greenhouse gas emissions reduction neutral. The purpose of section 18983.2 is to allow for new organic waste reduction technologies and processes that reduce greenhouse gases at least as much as composting to be approved for use in meeting regulatory requirements. 2 Gravuer, Kelly, July 22, 2016 University of California, Davis, <a href="https://www.cdfa.ca.gov/oefi/healthysoils/docs/CompostApplicationRate_WhitePaper.pdf">https://www.cdfa.ca.gov/oefi/healthysoils/docs/CompostApplicationRate_WhitePaper.pdf</a> . 3 CalRecycle, 2010, Third Assessment of California's Compost- and Mulch-Producing Infrastructure--Management Practices and Market Conditions, <a href="https://www2.calrecycle.ca.gov/Publications/Details/1358">https://www2.calrecycle.ca.gov/Publications/Details/1358</a> . 4 California Air Resources Board, May 2019, <a href="https://www.arb.ca.gov/cc/waste/cerffinal.pdf">https://www.arb.ca.gov/cc/waste/cerffinal.pdf</a> .
2023	Cummings, Dan; Sevana BioEnergy	Next, we are utilizing new AD technologies which produce RNG. The residual digestate has very little, if any, methane left over after full processing. Thus, the revised compost emission reduction factors in the proposed regulations do not match the new technologies being introduced. We would encourage CalRecycle to revisit this issue and have compost emission reduction factor on a scale that encourages technologies that have greater methane reduction.	The commenter asserts that a higher emissions reductions requirement than 0.30 MTCO2e/short ton organic waste be used to determine what technologies and processes are allowed to be deemed as reducing organic waste disposal in landfills. CalRecycle does not agree that a higher number should be used because this requirement and others will ensure that landfill disposal of organics is reduced and, assuming the State meets its overall diversion targets, allows the State to meet the 4 MMTCO2e reduction in greenhouse gas emissions outlined in the State's Short-Lived

Comment Number	Received From	Question/Comment	Response(s)
			Climate Pollutant Reduction Strategy. Setting the emissions reductions requirement higher would limit technologies with no reasonable justification.
2024	Cummings, Dan; Sevana BioEnergy	Further, we echo the other comments that paper not be included in the organic waste stream.	Comment noted. The statute requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.
2025	Cummings, Dan; Sevana BioEnergy	Finally, in Article 12/Procurement, we would echo other comments that the procurement standards be broad enough to encourage RNG for vehicles, buildings, CHP, electricity, and even for hydrogen that could be utilized in refineries to produce lower carbon fuels. A broad use of the RNG from these regulations will encourage greater participation and create a more robust forward-looking market.	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>
3008	Curtis, M., Concerned Parent	I just want to make sure that schools are equipped with the knowledge and connections to divert their waste. I am a parent who has been working on this at my daughter's school for over 3 years and have noticed many obstacles.	A change to the regulatory text was not necessary because food service providers are already included in the regulations as tier one commercial edible food generators. Beginning January 1, 2022, food service providers will be required to comply with the commercial edible food

Comment Number	Received From	Question/Comment	Response(s)
		<p>As you are aware, too much food is wasted at schools and this is because of so many reasons, many of which provide no accountability. The FSP is trying to make money and therefore, are not concerned with what is eaten, only what is ordered. Especially for schools that have low income, and thus provide free meals, the kids just take the food and throw it away, perhaps eating one item, and oien no items are even consumed.</p> <p>Our FSP is Revolution Foods (although all FSPs are a business, therefore profit is their goal). Revolution Foods tells the schools not to donate as it illegal, but it is not: SB577 and the Good Samaritan Act! They tell the schools not to save foods for the next meals also, but to throw it away and reorder. Our lunch lady wants to save the food and offer options, but is too scared of losing her job to follow her instincts. Revolution Foods sends foods that the students do not like in too much packaging. For example, the students never eat the baby carrots, yet they tell them to throw them away and just order new ones, individually wrapped in plastic, the next day so they can profit, despite the date on the packages being about 2 weeks until expiration. They also send 3 pieces of celery in a plastic container, wrapped in plastic film. They do not allow the mixing of fruits so kids can choose, despite having a different fruit option for breakfast and lunch. They must just serve each one at the meal, when providing an option would lead to more pleasing options for the students. If students could choose, they are more likely to consume it: more nutrition and less waste. They are instructed to serve just one option and throw the rest away. There is a disconnect that needs to be filled. The FSP needs accountability in this!</p> <p>My daughter has friends who have told me their school and aier-school program tells them to take the food and just throw it away so they can get their "numbers" for reimbursement. This needs to be illegal. In addition, telling kids to lie and throw away food is wrong on so many levels. School staff and parents need to be trained how to recycle, compost, donate, share, etc, as well.</p> <p>It will be difficult, but not impossible. The haulers provide initial education, as per their contract. They need to establish a contact person who is passionate about the environment, student health, or just keeping compliant with the law at every school site. The school needs to either have campus aides and/or a green student group be in charge. They can also have the students each perform a number of hours (15-20 hours each should fill the time slots, depending win the school size) of "community service" to help at the station in order to graduate to the next grade.</p> <p>The city may need a task force to check on the schools to make sure they are set up and doing correct item placement in the bins, donating correctly, paperwork in order, and any other help they mati need to transition to the new way. I recommend focusing first on schools that provide free meals to the students because parents don't even check the menu and kids just take it to see what is it and throw it away. When parents are paying, they check the menu and send lunch if they don't like the choice for that day.</p>	<p>generator requirements of SB 1383. In addition, the regulations require jurisdictions to provide commercial edible food generators (including food service providers and local education agencies) with education to assist them with SB 1383 compliance. The exact edible food recovery education and outreach requirements can be found in Section 18985.2 of the proposed regulations. CalRecycle would also like to clarify that a local education agency (which includes K-12 schools) with an on-site food facility is a tier two commercial edible food generator. As a tier two commercial edible food generator local education agencies will responsible for compliance with the commercial edible food generator requirements beginning January 1, 2024.</p> <p>To clarify, if a food service provider operates at a local education agency, then beginning January 1, 2022 the food service provider is responsible for compliance. The local education agency is not responsible for compliance until January 1, 2024.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>Once established, food rescue will become second nature to the students and staff, our goal! It should feel "wrong" to waste food aier practicing, as opposed to being instructed to do so as it stands now!</p> <p>Schools need lots of info about how they can indeed donate, and doing so will reduce their hauling fees as less is sent to the dump or compost.</p> <p>They all need to have child friendly posters and literature explaining what can go in each bin and how clean it needs to be and what can be saved, in relevance to school food and the containers they come in.</p> <p>With a lot of training and prac*ce, when they perfect it, their hauling bills should not increase if they share, donate, transfer food from programs, and recycle. The haulers need to inform them of this and get them to eliminate at least one of their big trash containers from their site and bill. The compost bin should replace a trash bin and recycling takes care of the rest of the bulk (done correctly, of course).</p> <p>Please reach out to me as an extremely involved parent who has years of experience gemng a school that servers free lunch from throwing everything in the trash to almost compliant with the new regulations.</p>	
1002	Curtis, Micki	<p>I hope there will be a task force to train the schools a few times and follow up.</p> <p>I hope they inform schools about the new regs as they still believe food can't be donated, shared, transferred from one meal to the next, etc. They are so scared of liabilities that no longer exist.</p> <p>I hope they help fill out all necessary paperwork to get them on track and make sure there is a contact point at the school who is responsible.</p> <p>I hope they train not only the students, but the staff and parents as well.</p>	<p>Local jurisdictions should still provide education to non-local entities and local education agencies within their geographic boundaries, as they already are doing under AB 1826 and AB 341. It is Important for these entities to know what collection options are available locally. CalRecycle will also provide assistance to local education agencies in implementing programs. The regulations already provide that compliance with this provision by these entities would be enforced by CalRecycle. CalRecycle will be providing guidance and training to regulated entities including schools.</p>
1003	Curtis, Micki	<p>I hope there are videos, fliers, games, on line resources, etc. in both English and Spanish and more languages too. I hope these are all consistent with he city because as of now, they are not.</p>	<p>Once the regulations are adopted, CalRecycle will create other educational samples resources.</p>
1004	Curtis, Micki	<p>Our hauler says they are not set up for composting yet. I thought under the franchise, they were supposed to be already.</p>	<p>Comment noted. The comment is not directed at the regulatory text.</p>
1005	Curtis, Micki	<p>I have seen a lot about grocery stores, but little info on schools regarding this issue. There needs to be more press to gear them up as it takes time to with mentalities. Schools are also important to target as the kids are our future and we are currently training them to waste by forcing them to take the food and the components so the schools can get their "numbers" for reimbursement and the FSP, their money.</p>	<p>CalRecycle will be providing guidance and training to regulated entities including schools.</p>
1174	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	<p>Section 18083(c) - How is the term "oversee" defined?</p>	<p>CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.</p>

Comment Number	Received From	Question/Comment	Response(s)
1175	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Section 18083(c) - What standardized method of measurement is expected of the LEA to oversee?	CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.
1176	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Section 18083(c) - What training will CalRecycle provide to the LEA to ensure method of measurement meets the State's expectation?	CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.
1177	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Section 18083(c) - Does reviewing of measurement reports during the inspection meet the "oversee" definition?	CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.
1178	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Section 18083(c) - Will the LEA receive an unfavorable evaluation from CalRecycle as a result of the solid waste operator's failure to meet the mentioned 14 CCR Sections regarding to measurements? How will the LEA's performance standard be impacted?	CalRecycle has deleted Section 18083(c) in response to comments. The subdivision was removed, and the requirements were included as part of the transfer/processing EA verification requirements under Section 17409.5.12. The change will be aligned with the current standards the EA are already required as part of the EA Roles and Responsibilities. The EA will evaluate the operating standard as described in the operation document. The change was necessary for statewide consistency and ensures the measurements prescribed in the regulations are performed properly.
1179	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Current transfer/processing facility in San Francisco accepts source separated organic waste collection stream "green bin" and does not process the organic waste on site. The organic waste is hauled to another facility for further separation and processing. Would this transfer/processing facility need to comply with Section 17409.5.4(a)-(d)?	Comment noted. If the facility meets the definition of a consolidation site then it would not be subject to requirements of Sections 17409.5.1 through 17409.5.8, otherwise the facility would be required to comply with the measurement protocols for source separated organic waste handling.
1180	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	If the above mentioned site is required to comply with Section 17408.5.4(a)-(d), the transfer/processing facility in this case would have to implement a brand new operation of sorting and separating the different types of organic waste. Would this requirement at minimum, result in a RFI amendment to the TPR to reflect new operation?	Comment noted. Depending on the type of operational change and the type of tiered permit, a specific permit action might be warranted (RFI Amendment, Permit Revision, etc.). If the permit allows for this type of activity, an RFI Amendment may only be required. If the permit prohibits this type of activity, then some type of permit action may be required. Operators should consult with the Local Enforcement Agency and Department's Permitting and Assistance Branch's Point of Contact to determine what type of permit action is required for this of change.

1181	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Section 17867(a)(16)- If a chipping and grinding operation is generating minimal residual and using the curb side waste collection stream (gray container) as a method to remove the residual, does this site have to comply with Section 17867(a)(16) to determine the monthly percentage of organics waste contained in residual removed after processing?	A change to the regulatory text is not necessary. A chipping and grinding operation is only allowed to accept green material. Therefore, these operations are prohibited from receiving waste from gray containers.
1182	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Does the chipping and grinding operation described in the above case scenario have to meet Section 17869(e)(6) Daily Outgoing Weights of Residual Sent to Disposal requirement?	A change to the regulatory text is not necessary. A chipping and grinding operation is only allowed to accept green material. Therefore, these operations are prohibited from receiving waste from gray containers.
1183	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	If so, what documentation would satisfy this requirement?	A change to the regulatory text is not necessary. A chipping and grinding operation is only allowed to accept green material. Therefore, these operations are prohibited from receiving waste from gray containers.
1184	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	Article 15. Enforcement Oversight by the Department - Question: In San Francisco, multiple departments within the City and County may share the responsibility of enforcing different sections of the proposed regulation. Who at the jurisdiction will the Department notify to address jurisdiction compliance?	CalRecycle has revised section 18981.2 in response to this comment. The change allows for the jurisdiction to include the point of contact for the designee.
1185	Cushing, Stephanie, San Francisco Department of Public Health, Environmental Health	General Question on Funding -Question - Will there be funding available from CalRecycle for program implementation that is currently unfunded or can the regulation add a language to provide a mechanism for the local jurisdictions to recover costs for implementing the new regulation?	Refer to Public Resources Code Section 42652.5(b) which states that a local jurisdiction may charge and collect fees to recover the costs associated with complying with these regulations Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not

Comment Number	Received From	Question/Comment	Response(s)
			provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
14	Darling, G, Darling H2O Consulting	As a previous General Manager of a wastewater treatment plant in Contra Costa County (Delta Diablo), I strongly urge CalRecycle not to limit eligible diversion technologies to compost and anaerobic digestion, which excludes the majority of the organic landfill waste stream and misses the opportunity to produce renewable energy and take many high energy wastewater treatment plants “off the grid” and reduce volumes by 90% resulting in far fewer trucks on the road and significantly lower GHG footprints.	CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO2e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383. However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste. Please refer to Section 18983.2 for more information.
15	Darling, G, Darling H2O Consulting	In several places, the proposed regulations limit eligible conversion technologies to compost and anaerobic digestion, which excludes the conversion of wood and other cellulosic waste that comprises the majority of the organic waste going to landfills. There is no legal or scientific justification for this, and very good policy reasons to broaden the definitions of eligible conversion technologies.	CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO2e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383. However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste. Please refer to Section 18983.2 for more information.
16	Darling, G, Darling H2O Consulting	A. Article 1 – Definitions (62) “Renewable transportation fuel” means fuel derived from renewable gas from organic waste that has been diverted from a landfill and processed at <b>either (a)</b> an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste, <b>or (b) converted pursuant to Public Resources Code section 40106.</b>	Note that “renewable transportation fuel” has been revised to “renewable gas” in the draft regulatory text. Regarding expanding “renewable gas” to include gas from biomass conversion, CalRecycle has revised the text to allow electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. However, for thermal and noncombustion thermal conversion technology, CalRecycle disagrees with this approach. These technologies are not yet in practice on a commercial scale in California and lack the necessary conversion factors to include in Article 12. For the current regulatory proposal, CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products using publicly available pathways and conversion factors.
17	Darling, G, Darling H2O Consulting	B. Article 2 – Section 18983.1	CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion

Comment Number	Received From	Question/Comment	Response(s)
		<p>(6) Land application, as defined in Section 17852(a)(24.5) of this division subject to the following conditions: (A) Green waste or green material shall meet the definition of Section 17852(a)(21) and shall have been processed at a solid waste facility, as defined by Section 40194 of the Public Resources Code.</p> <p>(B) Biosolids shall:</p> <ol style="list-style-type: none"> <li>1. Have undergone anaerobic digestion or composting, as defined in Part 503, Title 40 of the Code of Federal Regulations, Appendix B, <b>or biomass conversion pursuant to Public Resources Code section 40106</b>, and,</li> <li>2. Meet the requirements in Section 17852(a)(24.5)(B)(6) of this division for beneficial reuse of biosolids.</li> </ol> <p>(C) Digestate shall:</p> <ol style="list-style-type: none"> <li>1. Have been anaerobically digested at an in-vessel digestion operation or facility, as described in Sections 17896.8 through 17896.13, <b>or converted to biochar through an eligible conversion process pursuant to Public Resources Code section 40106</b>; and,</li> <li>2. Meet the land application requirements described in Section 17852(a)(24.5)(A).</li> <li>3. Have obtained applicable approvals from the State and/or Regional Water Quality Control Board requirements.</li> </ol>	<p>or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO<sub>2</sub>e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383.</p> <p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste.</p> <p>Please refer to Section 18983.2 for more information.</p>
18	Darling, G, Darling H2O Consulting	I urge CalRecycle, therefore, to encourage projects that produce both energy and compost as they will provide far greater SLCP reductions than compost alone. The science is clear that converting diverted organic waste to bioenergy and compost provides the greatest greenhouse gas reductions of any end use.	CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO <sub>2</sub> e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383. <p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste.</p> <p>Please refer to Section 18983.2 for more information.</p>
19	Darling, G, Darling H2O Consulting	While each project will differ, in most cases, CalRecycle should encourage projects that produce bioenergy and then compost the remainder in the form of biochar, in order to maximize SLCP reductions from diverted organic waste, which is the best way to meet the requirements of Health and Safety Code section 39730.6.	Comment noted. The commenter is providing an opinion about inclusion of biochar to maximize methane reduction. CalRecycle's regulations are designed for diversion of organic waste from landfills as opposed to quantifiable methane reduction. The regulations include procurement requirements that encourage production of renewable gas from organic waste.
20	Darling, G, Darling H2O Consulting	I support the comments of other parties that recommend the proposed regulations be broadened to include state procurement and other procurement in addition to local governments. This will help to achieve the requirements of SB 1383 in the most expeditious and cost-effective manner.	Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor's office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot

Comment Number	Received From	Question/Comment	Response(s)
			<p>supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.</p>
3179	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	The Task Force recognizes the significant responsibility CalRecycle has under State law to achieve the Statewide 75 percent “recycling” goal by 2020, reduce organic waste disposal by 75 percent by 2025, support the Air Resources Board in reducing climate pollutants, and the limited time granted by the State Legislature to achieve these goals. However, while the Task Force strongly supports efforts to reduce climate pollutants, the Task Force is very concerned about the approach that CalRecycle has selected, which places a tremendous burden and responsibility on counties and cities (more than any other stakeholder group, including, but not limited to, state agencies, public and private colleges and universities, school districts, local education agencies and non-local entities as defined in Article 1, Section 18982 (a) (40) and (42), respectively, etc.), while relying on extremely prescriptive requirements, excessive “bean counting” and reporting, and requiring counties and cities to impose steep penalties on residents and businesses. State law, Section 40001(a) of the Public Resources Code (PRC), declares that “the responsibility for solid waste management is a shared responsibility between the	Comment noted. Commenter is expressing an opinion on the overall regulatory model that CalRecycle is using as well as potential difficulties in assessing fees to offset regulatory costs. CalRecycle acknowledges that compliance with the regulations may pose challenges for local jurisdictions due to the ambitious organic waste diversion mandates set by the Legislature on a very short timeline. CalRecycle has determined that this regulatory model is necessary to achieve those mandates.

Comment Number	Received From	Question/Comment	Response(s)
		<p>state and local governments (emphasis added).” Furthermore, SB 1383 recognizes the shared responsibility “the waste sector, state government, and local governments” have in achieving the organic waste reduction goals for 2020 and 2025, and thus requires CalRecycle to analyze the progress made by the three sectors, in that order, including “commitment of state funding”, in achieving the said goals {PRC Section 42653. (a)} (emphasis added). However, under the proposed regulations, the responsibility weighs much more heavily on counties and cities, including programmatic and penalty requirements, than on state agencies, school districts, and special districts, local education agencies, and non-local entities (as an example, see provisions of Articles 14 and 15 of the proposed regulations). For example, SB 1383 notes that the California Constitution requires the state to “reimburse local agencies and school districts for certain costs mandated by the state (see SB 1383, preamble). SB 1383, Section 7 further states that “No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act...” While both local agencies and school districts may have authority to levy service charges, fees, or assessments, the proposed regulations disproportionately place the responsibility on counties and cities, even though they may encounter as much difficulty in raising charges, fees, or assessments as school districts. State agencies similarly are held to a much lower standard than counties and cities, while not being subject to a measurable penalty. Therefore, the Task Force strongly recommends the proposed regulations be revised to provide for a more equitable distribution of the responsibility for achieving the disposal reduction goals among all sectors, including industry, state government, school districts, public and private colleges and universities, and other non-local entities and local education agencies, etc.</p>	
3180	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>The proposed regulations impose requirements on counties and cities that exceed the authority granted to CalRecycle by State law or are contrary to it.</p> <p>a. SB 1383 does not provide CalRecycle with the authority to require local jurisdictions to impose civil (monetary) penalties on residential or commercial organic waste generators for non-compliance.</p> <p>The proposed regulations (Article 16, Section 18997.1) require jurisdictions to “adopt ordinance(s) or enforceable mechanisms to impose penalties that are equivalent or stricter than those amounts in Section 18997.2...” (emphasis added). In addition, Section 18997.2. Penalty Amounts, requires: “(a) A jurisdiction shall impose penalties that are equivalent or stricter than those amounts in Table 1 of this section and shall be calculated by determining the type of violations that have occurred, the number of violations that have occurred, and the corresponding penalty level in subsection (b).” (emphasis added).</p> <p>While SB 1383 grants CalRecycle the authority to “require local jurisdictions to impose requirements on generators or other relevant entities within their</p>	<p>Regarding Public Resources Code Section 40059, there are two phrases that must be taken into account in its application to SB 1383.</p> <p>First, Public Resources Code Section 40059 applies to aspects of solid waste handling “which are of local concern.” The organic waste diversion mandates in SB 1383 are of statewide application and statewide concern. As described in other responses to comments, CalRecycle was granted broad statutory authority by the Legislature to create rules designed to implement these statewide mandates and ensure the statutory organic waste diversion requirements are met. To the extent there are provisions in the rulemaking that touch on aspects of local solid waste handling, these are regarding matters of statewide concern that have been determined by CalRecycle to be necessary to achieve the goals of SB 1383.</p> <p>Second, Public Resources Code Section 40059 contains the introductory phrase, “Notwithstanding any other provision of law, each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern...” This phrase contemplates that other laws exist that may affect local solid waste handling and that the mere existence of those laws does not automatically preempt local governments from regulating the</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>jurisdiction,” this authority does not extend to the imposition of penalties (emphasis added). SB 1383 only provides that CalRecycle “may authorize local jurisdictions to impose penalties on generators for noncompliance” {see Section 42652.5. (a)(1) of the Public Resources Code (PRC)} (emphasis added).</p> <p>In requiring counties and cities to impose steep civil penalties (\$500 per day per violation) on residents and businesses for non-compliance with each requirement of the regulations, CalRecycle would exceed its authority under the law. Such authority is vested on local governmental agencies by PRC Section 40059, which states that, “each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern, including, but not limited to, frequency of collection, means of collection and transportation, level of services, charges and fees, and nature, location, and extent of providing solid waste handling services.” (emphasis added).</p> <p>Therefore, the Task Force strongly recommends the proposed regulations be revised to delete any and all provisions that require counties and cities to impose civil (monetary) penalties on their residents or businesses. The language may be revised pursuant to PRC Section 42652.5 (a)(1) to authorize counties and cities to do so, as they deem appropriate (emphasis added).</p>	<p>enumerated subject areas. It was designed to make clear that the state was not preempting the entire field of solid waste handling and that local jurisdictions were still allowed to regulate in certain areas.</p> <p>As such, Public Resources Code 40059 is not a limitation on CalRecycle from regulating aspects of solid waste handling to the extent they are of statewide concern.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to ‘fill up the details’ of the statutory scheme.”</p> <p>Administrative Civil Penalty tables, including “Base Table 6,” were deleted from the proposed regulations</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second,</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
3181	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>b. SB 1383 does not preclude CalRecycle from considering county or city "good faith efforts" to comply with the regulations.</p> <p>CalRecycle's Statutory Background and Primary Regulatory Policies document states, in part, that "Legislative guidance directs CalRecycle not to...utilize the "Good Faith Effort" compliance model specified in PRC Section 41825." This is inaccurate and contrary to the language of SB 1383. Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider "good faith effort" in determining a jurisdiction's progress in complying with the law. It states that CalRecycle "shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825..." (emphasis added).</p> <p>Since PRC Section 41825 establishes the process to determine whether a jurisdiction has made a "good faith effort" to comply with the law, it is clear that CalRecycle is required to consider "good faith effort" in making its determination of a jurisdiction's progress. Therefore, the proposed regulations need to be revised to provide for this provision.</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>
3182	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>As proposed, the definition of "organic" is extremely broad and basically includes plastics. The inclusion of plastic does not fit into the concept of organic collection and processing. This definition should be narrowed to prevent confusion, be consistent with state law, and should not include textiles, carpets, fiber, biosolids, digestate, or sludges. Textiles, carpets, and any other new materials should not be considered "organic" material unless their greenhouse gas (GHG) potential is analyzed. See the "Specific Comments" section of this letter, Article 1, Section 18982 (a) (46), for further comments and recommendations.</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>
3183	DeChellis. P., City of La Canada Flintridge -- refers	<p>The proposed regulations require local governments to purchase recovered/recycled organic waste products targets set by CalRecycle. While we cannot see any statutory procurement requirement within the provisions of SB</p>	<p>SB 1383 contains a broad grant of regulatory authority to place requirements on jurisdictions designed to achieve the organic waste diversion goals in the statute. CalRecycle has determined the procurement requirements are necessary to achieve those goals by ensuring end uses for</p>

Comment Number	Received From	Question/Comment	Response(s)
	to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	1383, the implementation of these requirements will result in substantial additional costs to local governments over and above the costs jurisdictions already anticipate to incur for complying with the extensive programmatic requirements of the proposed regulations. Therefore, the Task Force respectfully request that CalRecycle instead work to develop markets for recovered/recycled organic waste products. Further, the additional costs that will result from complying with the proposed regulations' procurement requirements represent an unfunded state mandate under California Constitution, Article XIII B, Section 6 (a) since the proposed regulations would impose a new program on local governments and neither the draft regulations nor the Initial Statement of Reasons identifies a state funding source. CalRecycle should not rely on the fee authority granted to local governments in SB 1383. Any fee that a city, a county or city and county attempts to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, sec. 1(e) (Prop. 26) as it would not meet any of the exceptions identified in that section. Further, even if a fee were to survive scrutiny under Proposition 26, it is questionable whether a jurisdiction would not have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII D, sec. 6 (Proposition 218). This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929). For these additional reasons, the Task Force requests that the proposed procurement requirements be addressed in a separate regulatory proceeding.	processed organic waste. Moreover, CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate. First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)). Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe "any fees" that may in the future be imposed by the numerous local jurisdictions in California as "likely" to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383. According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate. Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.
3184	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	The Task Force strongly believes that jurisdictions and regulated agencies would like to see the proposed regulations to be less prescriptive, more flexible, and less punitive, as well as to include reasonable timeframes for compliance. At the same time CalRecycle should focus state efforts on market development, technical support, including efforts to investigate emerging technologies leading to the development of new facilities and products, and funding for infrastructure.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.

	Integrated Waste Management Task Force comments		
3185	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>“Special Districts” should be defined in the regulations. Furthermore, the regulations should clarify whether special districts are considered “jurisdictions” or “non-local entities,” since “special districts” are included in both definitions.</p>	<p>In response to this comment, CalRecycle defined a “special district” as having the same meaning as Section 41821.2 of the Public Resources Code. Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a “special district that provides solid waste collection services” is a jurisdiction. Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction’s regulations related to solid waste. The definition of “non- local entity,” lists special districts as an example of a type of entity that could be a “non- local entity” but it does not definitively state that all special districts are non-local entities. Any special district that is a “jurisdiction” and also a “non-local entity” generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3.</p>
3186	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>The proposed definition of "Food recovery organization" as written includes temporary food facilities, as defined under Section 113842 of the Health and Safety Code. According to the Health and Safety Code (H&amp;SC): Nonprofit charitable temporary food facilities" means either one of the following:</p> <p>(a) A temporary food facility, as defined in Section 113930 of the H&amp;SC, that is conducted by a nonprofit charitable organization, as defined in Section 113841 of the H&amp;SC.</p> <p>(b) An established club or organization of students that operates under the authorization of a school or other educational facility.</p> <p>Should these clubs and organization be included, local jurisdictions would have to:</p> <p>1) Annually identify all clubs or organizations at schools and other educational facilities (which are considered non-local entities) operating within the jurisdiction and maintain these school clubs and organizations on the jurisdiction’s website and outreach materials as potential temporary food facilities for use by commercial edible food generators - pursuant with Section 18985.2 of the proposed regulations.</p> <p>2) Assess the edible food recovery of school clubs and organizations which are involved in food recovery activities - pursuant to Section 18991.2(a)(2) of the proposed regulations.</p> <p>The Task Force recommends that nonprofit charitable temporary food facilities be excluded from the requirements listed under Section 18985.2(a)(1) and Section 18991.2(a)(2) of the proposed regulations, as they do not contribute greatly to existing food recovery capacity, and it would be an undue burden to both jurisdictions and student organizations to have to comply with these regulations.</p> <p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p>	<p>Removing “nonprofit charitable temporary food facilities” from the definition of “food recovery organization” was not necessary because these entities are a type of food recovery organization that should be recognized and also can help California achieve its 20% edible food recovery goal. However, CalRecycle recognizes that that assessing edible food recovery capacity at nonprofit charitable temporary food facilities could be onerous given that these entities include clubs or organizations of students that operate under the authorization of a school or other educational facility. To address this concern, CalRecycle revised section 18992.2. (a)(2) so that jurisdictions will not be required to assess capacity at nonprofit charitable temporary food facilities located within the county and jurisdictions within the county. This revision was necessary to help jurisdictions comply with the edible food recovery capacity planning requirements specified in Section 18992.2.</p> <p>Regarding the comment pertaining to Section 18985.2. Edible Food Recovery Education and Outreach (a)(1). The commenter has misinterpreted the requirement to develop a list of food recovery organizations and services operating within the jurisdiction. To clarify, the requirement does not specify that the jurisdiction shall maintain a list of all food recovery organizations and services operating within the jurisdiction, just that “a list” be created, maintained on the jurisdiction’s website, and updated annually.</p> <p>It is at the discretion of the jurisdiction to determine the food recovery organizations and services that they believe should be included on the list. Please note that the list is intended to serve as a tool to help commercial edible food generators find appropriate food recovery organizations and services to establish a contract or written agreement with pursuant to Section 18991.3(b), and thereby help ensure that edible food in the jurisdiction is not disposed in landfills, but rather put to its highest and best use of helping feed people in need.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(25) "Food recovery organization" means an entity that primarily engages in the collection or receipt of edible food from edible food generators and distributes that edible food to the public for consumption, including, but not limited to:</p> <p>(A) A food bank as defined in Section 113783 of the Health and Safety Code;</p> <p>(B) A nonprofit charitable organization as defined in Section 113841 of the Health and Safety code; and,</p> <p><del>(C) A nonprofit charitable temporary food facility as defined in Section 113842 of the Health and Safety Code.</del></p>	<p>Developing a list that includes food recovery organizations and services that have sufficient capacity and a proven track record of safely and efficiently recovering food for human consumption will help commercial edible food generators find food recovery organizations and services that are capable of safely handling and distributing recovered edible food on a routine basis.</p>
3187	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>The definition of "organic waste" as specified in the proposed regulations is extremely broad and means "solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges." This highly broad definition seems to state that organic waste includes any type of waste other than "inert waste." It may include solid waste, medical waste, non-inert hazardous waste, etc. The scope of this proposed definition can be reduced by limiting it to "organic solid waste." Furthermore, the definition in the regulations is inconsistent with the definition of "organic waste" in Section 42649.8(c) of the Public Resources Code (PRC), as established by Assembly Bill 1826 (2014). AB 1826 defines "organic waste" as "food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste." The intention of SB 1383 is to establish a statewide goal to reduce the landfill disposal of the types of organic waste listed under AB 1826. Therefore, the definition of organic waste in the proposed regulations should be revised to be consistent with the definition in AB 1826. Also see General Comment No. 3.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><del>(46) "Organic waste" or "organic solid waste" means solid wastes containing material originated from living organisms and their metabolic waste products, including but not limited to food, green material, landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, printing and writing paper, manure, biosolids, digestate, and sludges.</del> <b>food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.</b></p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>
3188	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	<p>The definition of "renewable transportation fuel" without any justifiable reason and/or scientifically supported analysis, limits it to fuel derived from renewable gas through in-vessel digestion of organic waste only. The regulations should expand the definition of "renewable transportation fuel" to include fuel derived from renewable gas from other technologies, including thermal conversion technologies such as gasification and pyrolysis, as well methane gas generated from municipal solid waste landfills since it is biogenic in origin.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul>	<p>Regarding expanding "renewable gas" to include gas from technologies such as gasification and pyrolysis, CalRecycle disagrees with this approach. These technologies are not yet in practice on a commercial scale in California and lack the necessary conversion factors to include in Article 12. For the current regulatory proposal, CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products using publicly available pathways and conversion factors.</p> <p>Regarding landfill gas, the SB 1383 mandate is to recover organic waste that would be disposed. Generating gas in municipal solid waste landfills requires disposal of organic waste in landfills;</p>

Comment Number	Received From	Question/Comment	Response(s)
	Integrated Waste Management Task Force comments	(62) "Renewable transportation fuel" means fuel derived from renewable gas <del>generated from organic waste that has been diverted</del> from a landfill, and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste, <b>a biomass conversion facility that is permitted or otherwise authorized by Division 30 of the Public Resources Code to recycle organic waste, or any other process or technology that is subsequently deemed under section 18983.2 to constitute a reduction in landfill disposal.</b>	therefore, it is inconsistent with statute to incentivize or mandate activities that do not reduce landfill disposal. CalRecycle revised the proposed regulatory text to allow for the use of electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.
3189	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	The term "entity," which is referenced multiple times in the regulations, should be defined in the regulations.	CalRecycle did not include a definition for "entity" because it is using the term in the regulations consistent with the commonly understood dictionary definition of the word as opposed to a specialized term requiring regulatory clarification. The term "entity" is used thousands of times in various state statutes without definition for the same reason. Regarding commenter's concern regarding use of the phrase "...and other entities," this phrase appears almost exclusively in the "General Provisions" portion of the regulations at Sections 18981.1 and 18981.2 and is intended to be a catch-all term for entities that are subject to explicit regulation under this rulemaking (eg. food recovery services and organizations) that are not otherwise listed in those sections. In Section 18981.2, the phrase is further limited to other entities "subject to the jurisdiction's authority..." This is intended to exclude certain entities like state agencies, federal facilities, special agencies and other such entities that are not subject to a local jurisdiction's regulatory authority. See the definition of "non-local entity" in Section 18982(a)(42). CalRecycle agrees that any inspections are subject to Fourth Amendment requirements. CalRecycle agrees that a jurisdiction is not obligated to undertake inspections or other enforcement action against entities outside of their regulatory jurisdiction. Inspection and enforcement against a "non-local entity," as appropriate, would be undertaken by CalRecycle
3190	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	The term "regional agency," which is referenced in Sections 18981.2 (b) (2), 18987.2 (a) (1), 18992.1 (a), 18992.1 (b), 18992.2 (a), and 18992.3 (a), should be defined in the regulations.	Regional agencies are defined in Public Resources Code Section 40181. Per Public Resources Code Section 40100, that definition extends to regulations adopted under Division 30 of the Public Resources Code.
3191	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County	The term non-organic waste, which is referenced in Sections 18982 (55) (A), 18984.1 (a) (1), 18984.1 (a) (2), 18984.1 (a) (3), 18984.2 (a) (2), 18984.2 (a) (3), 18984.9 (b) (1), 18986.1 (b), and 18986.2 (b), should be defined in the regulations.	Comment noted. CalRecycle has determined that a definition of "non-organic waste" is not necessary since it can be determined based on anything that falls outside the included regulatory definition of "organic waste."

Comment Number	Received From	Question/Comment	Response(s)
	Solid Waste Management Committee/ Integrated Waste Management Task Force comments		
3192	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>The definition of “jurisdiction” has been modified in the proposed regulations to include “special districts that provide solid waste handling services.” No definition of solid waste handling is included in the proposed regulations; however, this phrase is defined in two sections of the Public Resources Code, (1) Section 40195 “the collection, transportation, storage, transfer, or processing of solid wastes”, and (2) Section 49505 “the collection, transportation, storage, transfer, or processing of solid waste for residential, commercial, institutional, or industrial users or customers.” This has created a problem in that some special districts provide some of those services but not all of them. Therefore, the Task Force requests that the proposed regulations be modified to only apply the requirements intended for a “jurisdiction” (as defined in the PRC Section 40145). As such the proposed change in the definition of jurisdiction is overly broad and should be narrowed to be consistent with the Public Resources Code definition of “jurisdiction” contained in Section 40145. In general, the Task Force recommends that CalRecycle keeps the definitions consistent with those in the Public Resources Code.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (36) “Jurisdiction” means a city, or county or a city and county <del>or a special district that provides solid waste handling services.</del> A city, county or county and city may utilize a Joint Powers Authority to comply with the requirements of this chapter, except that the individual city, county, or city and county shall remain ultimately responsible for compliance.</li> </ul>	Thank you for the comment. CalRecycle revised the definition of ‘jurisdiction’ in Section 18982(a)(36) because the original term “handling” as used in the definition is overly broad. This change is necessary to provide clarity.
3193	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>In addition to anaerobic digestion and composting, biosolids can also be processed through gasification. Biosolids that are gasified produce biochar, an organic soil amendment. The Task Force recommends that CalRecycle include the land application of biochar produced from biosolids as a reduction of landfill disposal. The California Energy Commission’s 2017 Integrated Energy Policy Report (2017 IEPR), published on April 16, 2018, states that the gasification of biosolids to produce biochar is a revenue source to promote the development of renewable natural gas (RNG) projects, which will be needed if jurisdictions are to meet the requirements to procure RNG transportation fuel per Section 18993.1(f)(2) of the proposed regulations.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (b) (6) Land application, as defined in Section 17852(a)(24.5), of this division subject to the following conditions:</li> </ul>	CalRecycle concurs that maintaining flexibility for other recovery processes, not specifically identified in section 18983.1(b), which may still constitute a reduction of disposal of organic waste and can achieve equivalent greenhouse house gas reduction that meets or exceeds the baseline of 0.30 MTCO2e per short ton. Therefore, the proposed regulations include Section 18983.2 Determination of Technologies That Constitute a Reduction in Landfill Disposal as a pathway for including additional activities and technologies.

Comment Number	Received From	Question/Comment	Response(s)
		<p>(A) Green waste or green material shall meet the definition of Section 17852(a)(21) and shall have been processed at a solid waste facility, as defined by Section 40194 of the Public Resources Code.</p> <p>(B) Biosolids shall:</p> <ol style="list-style-type: none"> <li>1. Have undergone <del>anaerobic digestion or composting</del>, <b>any of the pathogen treatment processes</b> as defined in Part 503, Title 40 of the Code of Federal Regulations, Appendix B, <b>or gasification, as defined in Section 40117 of the Public Resources Code, to produce biochar, as defined in Section 14513.5. of the Food and Agriculture Code</b>, and,</li> <li>2. Meet the requirements in Section 17852(a)(24.5)(B)(6) of this division for beneficial reuse of biosolids.</li> </ol> <p>(C) Digestate shall:</p> <ol style="list-style-type: none"> <li>1. Have been anaerobically digested at an in-vessel digestion operation or facility, as described in 14 CCR sections 17896.8 through 17896.13; and, 2. Meet the land application requirements described in 14 CCR Section 17852(a)(24.5)(A).</li> <li>3. Have obtained applicable approvals from the State and/or Regional Water Quality Control Board requirements.</li> </ol>	
3194	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>SB 1383, Section 42652 of the PRC reads as follows: "The Legislature finds and declares all of the following:</p> <p>"(a) The organic waste disposal reduction targets are essential to achieving the statewide recycling goal identified in Section 41780.01.</p> <p>(b) Achieving organic waste disposal reduction targets require significant investment to develop organics recycling capacity.</p> <p>(c) More robust state and local funding mechanisms are needed to support the expansion of organics recycling capacity."</p> <p>Based on the foregoing, it is clear that the Legislature and the Governor, as a part of the SB 1383 enactment, emphasized the need for development of alternative technology facilities beyond composting and anaerobic digestion technologies/facilities, upon which CalRecycle has heavily relied, while not placing sufficient emphasis on development of alternative technologies and even subjecting them to heavily restrictive standards that other methods and processes are not subjected to (such as land application). In doing so, the state has created a significant obstacle to development of facilities utilizing these technologies without a clear and scientifically substantiated justification. For example, Section 18983.2 states "To determine if the proposed operation counts as a permanent reduction in landfill disposal, the Department and/or CARB's Executive Office shall compare the metric tons carbon dioxide equivalent (MTCO<sub>2e</sub>) per short ton organic waste reduced by the process or technology, with the emissions reduction from composting organic waste" (emphasis added). To be consistent with requirements of PRC Section 42652 and technically correct, the analysis should be made in comparison to "landfilling" and not "composting." The Task Force would like to emphasize that the SB 1383 mandates reduction of organic waste disposal in</p>	<p>Several commenters suggested using avoided landfill emissions as the benchmark in the determination of processes or technologies that constitute a reduction in landfill disposal. Although this proposal might increase diversion of organics from landfills, it would not achieve the greenhouse gas emissions reductions required to meet the methane reduction target required by SB 1383 or the organics diversion targets specified in the Short-Lived Climate Pollutant Reduction Strategy. The benchmark value of 0.30 MTCO<sub>2e</sub> per short ton organic waste was set to ensure emission reductions for any new process or technology are comparable to the emission reductions necessary to achieve the strategy's emission reduction goal of 4 MMTCO<sub>2e</sub> for this sector.</p>

Comment Number	Received From	Question/Comment	Response(s)
		landfills and not any other type of facilities such as those utilizing conversion technology, (emphasis added).	
3195	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>This section does not specify obligations on the Department or the California Air Resources Board (CARB) to review the applications in a timely manner. The regulations must require the Department and CARB to make a determination in a realistic timeframe to facilitate the development of organics recycling infrastructure.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(2) The Department shall consult with CARB’s Executive Officer <b>within 30 days of receiving the application</b> to evaluate if the information submitted by the applicant is sufficient to determine the greenhouse gas emissions reduction potential of the proposed operation, and whether or not the proposed operation results in a permanent reduction in greenhouse gas emissions, and therefore counts as a reduction in landfill disposal. <b>The Department shall provide a response to the applicant within 90 days of receiving the application whether the information submitted by the applicant is sufficient to determine the greenhouse gas emissions reduction potential of the proposed operation and, in the response, request additional information, if needed. The Department shall make a determination whether or not the proposed operation results in a permanent reduction in greenhouse gas emissions, and therefore counts as a reduction in landfill disposal, and inform the applicant of the decision within 180 days of receiving the application.</b></p>	<p>The commenters request greater certainty as to when to expect CARB and/or CalRecycle will determine whether a proposed process or technology constitutes a reduction in landfill disposal. CalRecycle added clarification in the regulation, including that CalRecycle would let applicants know within 30 days of receipt of the application whether or not CalRecycle needs more information to process the application, and that CalRecycle will inform the applicant within 180 days after they have all needed information as to whether or not the process or technology is deemed to count as a reduction in landfill disposal. This timeline will provide applicants with a reasonable timeline for receiving determinations on proposed processes or technologies.</p>
3196	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>CalRecycle and CARB have joint authority over the verified technology determination. As the SB 1383 regulation text currently reads, either CalRecycle, CARB, or both can make this determination. The roles must be better defined to avoid delaying the technology verification process and to facilitate the development of new infrastructure.</p>	<p>CalRecycle modified the text to clarify that CalRecycle, as the entity overseeing implementation of this regulation, makes the final determination of whether a process or technology constitutes a reduction in landfill disposal. This change is needed to clarify roles.</p>
3197	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	<p>Section 18983.2 specifies the process used to determine if operations, facilities or activities not expressly identified in the regulation shall be deemed to constitute a reduction of landfill disposal. Once this determination is made, it would be reasonable for comparable processes or technologies to be similarly deemed to constitute a reduction of landfill disposal. Section 18983.2(c) appears to provide this opportunity. The regulations must clarify if this is the intent and the section must be expanded to more specifically outline the streamlined approach that would be followed. To facilitate infrastructure development, future applicants should not be required to repeat the verification process for an already-approved process.</p>	<p>As noted in the Initial Statement of Reasons, the purpose of subdivision 18983.2(c) “is to allow an applicant to request that CalRecycle consider additional information not otherwise required in Article 2 that shows that the applicant’s proposed recovery activity should be considered identical or equivalent to a proposed recovery activity already deemed by CalRecycle, through the process outlined in 18983.2(a), to result in a reduction in landfill disposal. This section is necessary to clarify that applicants may submit additional information to CalRecycle for consideration.” This section is not meant to streamline applications but is meant to allow for applicants not to go through the full process/technology application process if an identical or equivalent technology for process has already been approved.</p>

	Integrated Waste Management Task Force comments		
3198	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18984. The regulations are prescriptive in the requirements for organic waste collection services provided by the jurisdictions. Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider “good faith effort” in determining a jurisdiction’s progress in complying with the law. It states that CalRecycle “shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825...” (emphasis added). Therefore, the Task Force recommends that CalRecycle revise the regulations to incorporate provisions for jurisdictions demonstrating a “good faith effort” to comply.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) This article specifies the <del>minimum</del> <b>recommended</b> standards for organic waste collection services provided by jurisdictions, outlines efforts jurisdictions must <b>demonstrate a good faith effort</b> to engage in to reduce container contamination, delineates <b>recommended</b> container color and labeling requirements, specifies criteria for rural jurisdictions to be exempt from specified requirements of this section and criteria for jurisdictions to waive requirements for specified generators. This article additionally specifies associated recordkeeping requirements for these standards. 3199 No change. See responses to comments 6196, 6197.No change. SB 1383 provides a broad grant of regulatory authority to the Department to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This authority includes creation of rules designed to implement these statewide mandates and insure that the statewide organic requirements are met. The department has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals. Regarding Public Resources Code Section 40059, these regulations are not inconsistent because this section applies to aspects of solid waste handling “which are of local concern.” Public Resources Code Section 40059 is not a limitation on the Department from regulating aspects of solid waste handling that are of statewide concern such as the achievement of organic waste diversion mandates in SB 1383. Public Resources Code Section 40059 specifically states “Notwithstanding any other provision of law, each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern...” This phrase was designed to make clear that the state was not preempting the entire field of solid waste handling and that local jurisdictions were still allowed to regulate</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>

3199	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>in certain areas involving matters of local concern. ELLIOT/TAMAR. Note my response to Comment 3180.</p> <p>Pursuant to SB 1383, Subdivision 45652 of the PRC, the Legislature, among other things, finds and declares that “(a) The organic waste disposal reduction targets are essential to achieving the statewide recycling goal identified in Section 41780.01.” The “simplest” way to measure the reduction of organic waste disposal is to quantify the tonnages of organic waste being diverted. As such, the Task Force questions the prescriptive/mandatory collection services, including the required containers and their colors, which would be mandated by the proposed regulations, are unnecessarily onerous and would impose a significant cost to counties, cities, and their residents and businesses. The Task Force strongly recommends that CalRecycle conduct and make available a detailed cost benefit analysis of the various alternative approaches to the mandatory organic waste collection service requirements considered. The Task Force also believes that said requirements are inconsistent with the state law, PRC Section 40059. The Task Force respectfully requests CalRecycle to address these issues in the next version of the proposed regulations.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This authority includes creation of rules designed to implement these statewide mandates and ensure that the statewide organic requirements are met. CalRecycle has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals.</p> <p>Regarding Public Resources Code Section 40059, there are two phrases that must be taken into account in its application to SB 1383.</p> <p>First, Public Resources Code Section 40059 applies to aspects of solid waste handling “which are of local concern.” The organic waste diversion mandates in SB 1383 are of statewide application and statewide concern. As described in other responses to comments, CalRecycle was granted broad statutory authority by the Legislature to create rules designed to implement these statewide mandates and ensure the statutory organic waste diversion requirements are met. To the extent there are provisions in the rulemaking that touch on aspects of local solid waste handling, these are regarding matters of statewide concern that have been determined by CalRecycle to be necessary to achieve the goals of SB 1383.</p> <p>Second, Public Resources Code Section 40059 contains the introductory phrase, “Notwithstanding any other provision of law, each county, city, district, or other local governmental agency may determine...aspects of solid waste handling which are of local concern...” This phrase contemplates that other laws exist that may affect local solid waste handling and that the mere existence of those laws does not automatically preempt local governments from regulating the enumerated subject areas. It was designed to make clear that the state was not preempting the entire field of solid waste handling and that local jurisdictions were still allowed to regulate in certain areas.</p> <p>As such, Public Resources Code 40059 is not a limitation on CalRecycle from regulating aspects of solid waste handling to the extent they are of statewide concern.</p>
3200	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	<p>Section 18984.4. Recordkeeping Requirements for Compliance with Organic Collection</p> <p>The Task Force is concerned about the requirement (a)(3)(D) which states that the jurisdiction must provide the geographical areas served by the haulers, along with routes serviced, or a list of addresses served. Jurisdictions, through their franchise agreements/contracts, have committed to protecting proprietary information which may result in an economic disadvantage should the information be disclosed to haulers' competitors. The Task Force recommends order to protect the hauler's proprietary information.</p>	<p>The comment refers to recordkeeping requirements for jurisdictions to retain. This information is not required to be reported publicly. To the extent that documents required to be retained in a jurisdiction's Implementation Record contains truly proprietary or trade secret information, there are existing protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow public agencies to withhold such information from public disclosure. The proposed regulations provide for this.</p>

Comment Number	Received From	Question/Comment	Response(s)
	Integrated Waste Management Task Force comments	<p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(a) A jurisdiction shall include the following information and documents in the Implementation Record required by Section 18995.2 of this chapter:</p> <p>(1) A description of which collection method(s) it will use to comply with this article.</p> <p>(2) The geographical area for each collection method</p> <p>(3) If the jurisdiction is using a service that requires the contents of containers provided by the jurisdiction to be transported to a high diversion organic waste processing facility, the jurisdiction shall at a minimum:</p> <p>(A) List all high diversion organic waste processing facilities used by the jurisdiction.</p> <p>(B) Include copies of, quarterly and annual average mixed waste organic content recovery rates, for each of those facilities, as defined in Section 18984.3.</p> <p>(C) List all approved haulers in the jurisdiction that are allowed to take organic waste to the jurisdiction’s identified high diversion organic waste processing facility or facilities.</p> <p>(D) The geographical area the hauler(s) serves, <b>or</b> the routes serviced, <del>or a list of addresses served.</del></p>	
3201	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18984.5. Container Contamination Minimization</p> <p>The regulations require jurisdictions to monitor containers and conduct route reviews as part of the container contamination minimization protocol. Furthermore, Section 18997.3 Base Table 1 lists monetary penalties for jurisdictions not implementing a container contamination minimization protocol. However, Section 17409.5.7.(c), Section 17409.5.11(b)(4), Section 17867(a)(4)(E), Section 17896.25.1(d), and Section 20901(d) state that the enforcement agency (EA) may approve an alternative frequency for load checking at a facility if the facility receives waste from jurisdictions that are monitoring containers using the container contamination minimization described in Section 18984.5. This implies that a jurisdictions’ implementation of the container contamination minimization protocol is not required. CalRecycle should clarify in the regulations whether jurisdictions are required to implement a container contamination minimization protocol.</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization</p>
3202	DeChellis. P., City of La Canada	<p>Section 18984.5. Container Contamination Minimization</p> <p>This section indicates that if a jurisdiction is utilizing a two or three-container</p>	<p>Thank you for the comment. CalRecycle made the proposed changes, including changing from quarterly to annually. Also, jurisdictions may set what the routes are and the number of random</p>

Comment Number	Received From	Question/Comment	Response(s)
	Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>collection system, all collection routes must be reviewed quarterly for prohibited container contaminants. Due to the size of a jurisdiction, such as the County of Los Angeles geographical jurisdiction and the number of routes presently served, this presents an incredible burden on the jurisdiction's labor and financial resources. The Task Force recommends reducing the monitoring frequency requirement to something that jurisdictions may more realistically meet. The Task Force recommends shifting this requirement to not less than annually with statistically representative sampling. The Task Force believes similar results can be derived if certain routes are sampled by specific geographic regions (such as community) or population density.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) A jurisdiction shall conduct a route review for prohibited container contaminants on randomly selected containers in a manner that results in all collection routes being reviewed <del>quarterly</del> annually.</p>	<p>containers to select, which is the least costly and burdensome approach. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
3203	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18984.10. Property and Business Owner Responsibilities</p> <p>The Task Force recommends that this section be revised to specify that residential property owners do not have to arrange for access to individual residential unit, but only to common areas where solid waste and recycling containers are stored or may be stored. Inspectors cannot enter a private property without a Court order. However, inspections of residential containers can be made once the containers are placed in the designated area for collection.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(c) Property and business owners shall provide or arrange for access to their properties, <b>excluding the interior of each residential unit within the property</b>, during all inspections conducted pursuant to Article 14 of this chapter (commencing with Section 18995). <b>Residential containers can be inspected if they are placed in the designated area for collection.</b></p>	<p>CalRecycle revised Section 18984.10(c) in response to this comment to specify that residential property owners do not have to arrange for access to individual residential unit.</p>

Waivers and Exemptions Granted by the Department</p> <p>This section does not recognize the good faith efforts of a jurisdiction to comply with the provisions of this chapter but that is unable to fully comply due to</p>	<p>Section 18996.2 includes all circumstances outside of a jurisdiction's control, including the inability to identify a facility with sufficient capacity to process the materials. The regulations require a jurisdiction to demonstrate that extenuating circumstances exist and that it has made a "substantial effort" which means that it has taken all practicable actions to comply.</p>

Comment Number	Received From	Question/Comment	Response(s)
	Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>circumstances beyond its control. Provisions need to be provided for good faith efforts.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  <b>(d) The Department may grant waivers and/or extensions to any generator, hauler, or jurisdiction that has made good faith efforts to comply with the requirements of this article but has been unable to identify a facility with sufficient capacity to process the materials.</b></li> </ul>	
3205	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Chapter 3.1, Article 3, Section 17867 and Chapter 3.2, Article 3, Section 17867 of the proposed regulations state that material subject to a quarantine on movement issued by a county agricultural commissioner is considered incompatible material rather than organic waste. The regulations should clarify whether quarantined green waste will be exempt from the landfill disposal reduction requirements for organic waste. If quarantined green waste is required to be that the disposed tonnage will not count against the 50 percent and 75 percent landfill disposal reduction targets.</p> <p>In addition, CalRecycle should grant a waiver or exemption for material subject to a quarantine on movement issued by a county agricultural commissioner. Once this quarantined material is collected, it could be transferred to a facility outside of the quarantined zone contaminating other non-quarantined organic waste and spread disease, pests, or harmful bacteria or microorganisms. Additionally, the regulations should also provide a definition for “quarantined material.”</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  <b>(d-e) Quarantined Material</b>  <b>(1) The Department shall grant an exemption for organic waste collection, as specified in this chapter, for material subject to a quarantine on movement issued by a county agricultural commissioner. A jurisdiction may dispose of organic material if it is subject to a quarantine on movement issued by a county agricultural commissioner.</b></li> </ul>	<p>Thank you for the comment. Section 18984.5 was amended, "For the purposes of demonstrating compliance with 18998.1, organic waste that is textiles, carpet, hazardous wood waste, human waste, pet waste, or material subject to a quarantine on movement issued by a county agricultural commissioner, is not required to be measured as organic waste."</p> <p>These materials may be disposed without counting against a jurisdiction as they comprise a minimal portion of the organic waste stream and/or are uniquely difficult or problematic to recover from a health and safety perspective. Additionally, Section 18984.13 allows for the disposal of this waste.</p>
3206	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Please clarify if the definition of “organic waste” that is required to be separated either at the source or at a high-diversion materials recovery facility and diverted from landfill includes organic waste collected from routine non-emergency debris and catch basin cleanouts. The Task Force recommends that organic waste collected from debris and catch basin cleanouts be excluded from the diversion requirements. Because this organic waste accumulates in the stormwater system and is not disposed by any particular generator in a container, it is likely to contain significant contamination and is difficult to separate from other waste and recycle. The Task Force recommends adding a waiver to the regulations addressing organic waste collected from routine cleanouts of debris basins, catch basins, and other stormwater infrastructure.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b>  <b>(d) Stormwater Infrastructure Exemptions:</b></li> </ul>	<p>This situation is already covered in Section 18984.13(b)(3). This section allows for disposal of sediment debris removed from dams, culverts, reservoirs, channels and other flood control infrastructure.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p><del>(1)</del><b>The Department shall grant waivers for organic waste collected from routine clean-outs of catch basins, debris basins, and other stormwater infrastructure. A local jurisdiction or private contractor may apply to the Department for a general waiver to exempt the organic waste collected from stormwater infrastructures.</b></p> <p><del>(d e)</del> Nothing in this section exempts a jurisdiction from complying with the other requirements to promote and provide information to generators about, waste prevention, community composting, managing organic waste on-site, and other means of recovering organic waste, or any other requirements of this chapter</p>	
3207	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18984.13, Emergency Circumstances. This section does not address compliance requirements for those cases for which "State of Emergency" as proclaimed by the Governor and defined by the California Code of Regulations, Title 14, Section 17210.1 (k).</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(b) (3) In a case of a "State of Emergency" as proclaimed by the Governor and defined in Section 17210.1 (k) of this division, the Department shall grant a waiver to a jurisdiction(s) from complying with the requirements of this article. Additionally, disaster debris generated from such an emergency shall not be counted as jurisdictional disposal for the purpose of measuring compliance with requirements of this chapter by the Department.</b></p>	<p>Section 19894.13(b)(1) specifically references Sections 17210.4 (Granting An Emergency Waiver) and 17210.9 (Executive Director's Powers and Duties Relative to the Emergency Waiver) and addresses situations where the governor has declared a state of emergency as defined in Section 17210.1(k).</p> <p>A change in the regulatory text to not count disaster debris as jurisdictional disposal is not necessary. Again jurisdictions are subject to complying with regulatory actions, there is no jurisdictional disposal requirement for the purposes of this chapter.</p>
3208	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18984.13, Emergency Circumstances</p> <p>The Department should grant a waiver for jurisdictions demonstrating a good faith effort to comply with the regulations but are unable to do so due to factors outside of their control. Section 42652.5. (a)(4) of the PRC specifically requires CalRecycle to consider "good faith effort" in determining a jurisdiction's progress in complying with the law. It states that CalRecycle "shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825..." (emphasis added).</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(c) Rural Exemptions:</p> <p>(1)The Department shall grant an exemption from complying with the organic waste collection requirements specified in this article for Rural Jurisdictions that meet the definition of a "Rural Jurisdiction" in Section 42649.8 of the Public Resources Code, if the governing body of the jurisdiction adopts a resolution that includes a finding as to the purpose of and need for the exemption.</p> <p>(2) An exemption implemented pursuant to this subdivision shall be valid until January 1, 2025, or until five years after the Department makes a determination pursuant to Section 42649.82 (a)(2)(D) that the statewide disposal of organic waste has not been reduced to 50 percent of the level of disposal during the 2014 calendar year, whichever is later.</p> <p><b>(d) Good Faith Effort Exemptions:</b></p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p><b>(1) The Department shall grant an exemption from complying with a part of or all of the requirements of the regulations for a jurisdiction demonstrating a “good faith effort” to comply but cannot do so due to factors outside of its control.</b></p> <p>(d e) Nothing in this section exempts a jurisdiction from complying with the other requirements to promote and 40 provide information to generators about, waste prevention, community composting, managing organic waste 41 on-site, and other means of recovering organic waste, or any other requirements of this chapter.</p>	
3209	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18985.1. Organic Waste Recovery Education and Outreach</p> <p>Since solid waste facility operators are in direct contact with self-haulers and jurisdictions currently have no way of identifying a generator who is a self-hauler, the Task Force recommends giving solid waste facility operators the defined role of providing information regarding the requirements of Section 18988.3 of this chapter to the self-haulers.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) Prior to February 1, 2022, and annually thereafter, <del>a jurisdiction</del> <b>solid waste facility operators</b> shall provide to self-haulers information regarding the requirements of Section 18988.3 of this chapter.</p>	CalRecycle deleted requirements that jurisdictions specifically identify and educate self-haulers in response to this comment. Jurisdictions can meet the requirement to educate self-haulers by including information on self-hauling in their general education and outreach material provided to all generators. CalRecycle deleted language requiring solid waste facility operators to educate self-haulers as it would be overly burdensome and is outside the scope of what EAs monitor at solid waste facilities. This change was made to provide the least burdensome approach and still achieve the required disposal reduction.
3210	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18985.1. Organic Waste Recovery Education and Outreach</p> <p>Los Angeles County is a very linguistically diverse county. Within the unincorporated areas alone, there are many generators that are "Limited English Speakers". The Task Force is concerned that the regulations may require jurisdictions to provide the education and outreach materials in every language spoken by generators within a given jurisdiction.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(f) If more than five percent of a jurisdiction’s generators are defined as “Limited English Speaking Households,” or “linguistically isolated,” as defined by the U.S. Census Bureau, the jurisdiction shall provide the information required by this section in <del>a</del> <b>the most common</b> language or languages that will assure the information is understood by those generators <b>and may provide the information required by this section in other languages, upon request from a generator.</b></p>	Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.
3211	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18986.1. Non-Local Entities Requirements states that “materials subject to a quarantine on movement issued by a county” shall not be deposited in organic waste containers (green) or recycling containers (blue). However, the proposal does not prohibit disposal in the gray container, leading to the ultimate transfer of these materials to solid waste facilities which would cause the spread of contamination and/or disease. This issue needs to be addressed in the next version of the proposed regulations. Furthermore, collection requirements for non-local entities should be consistent with the requirements for collection services provided by jurisdictions to other generators, including residents and businesses. The requirements for collection services provided by local jurisdictions do not make reference to</p>	Thank you for the comment. CalRecycle amended the applicable section to state that a non-local entity's collection service shall be in compliance with the requirements in Article 3. Section 18986.1 was also amended to address hazardous wood waste should not be placed in the green, blue, or gray container to be consistent with Article 3.

The proposed regulations provide for this
3216	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18989.1 Cal Green Building Code</p> <p>The "non-local entities" and "local education agencies" do not report to local jurisdictions and, in most cases, they are not regulated by the local jurisdiction's building officials. As such, the Department is the best entity for managing the requirements of Section 18989.1. for these generators. The Department will be responsible for tracking and ensuring compliance by non-local entities and local education agencies.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p><b>(b) Non-local entities and local education agencies are to comply with requirements of Subsections (a)(1) and (a)(2) and reporting to the Department.</b></p>	No change in regulatory language is necessary since other sections of the regulations make clear that the Department has oversight authority over non-local entities and local education agencies.
3217	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste	<p>Section 18990.1. Organic Waste Recovery Standards and Policies</p> <p>Based on provisions of Subsection (c)(4), the proposed requirements of the Subsection(b)(3) contradict the decision in UNITED HAULERS ASSOCIATION, INC., ET AL V. ONEIDA-HERKIMER SOLID WASTE MANAGEMENT AUTHORITY ET AL., that prevents jurisdictions to utilize flow control.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul>	Oneida-Herkimer states that an ordinance requiring waste go to a public facility does not violate the flow control restrictions of the Commerce Clause, it does not authorize or require that municipalities be allowed to do so under the US Constitution nor does it prohibit a state from prohibiting such restrictions.. The Integrated Waste Management Act (IWMA) explicitly promotes the free movement of material under Public Resources Code Sections 40001 and 40002 and this restriction is designed to ensure that.

Comment Number	Received From	Question/Comment	Response(s)
	Management Committee/ Integrated Waste Management Task Force comments	(b)(3) Limit the export <del>outside</del> of organic waste to a facility, operation, property or activity outside the jurisdiction that recovers the organic waste through a method identified in Article 2 of this chapter. (c)(4) Prohibit a jurisdiction from arranging through a contract or franchise for hauler <b>or a self-haul organic waste generator</b> to transport organic waste to a particular solid waste facility or operation for processing or recovery.	Section 18990.1 (b)(3) prohibits the limitation of exports outside the jurisdiction, which is necessary in order to address the need for regional collaboration and to ensure the highest diversion rates are achieved in order to meet the goals of the statute. CalRecycle did make a change to subsection (b)(3), however, to remove bad syntax in response to this comment.
3218	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18991.1. Jurisdiction Edible Food Recovery Program The Task Force recommends that the State specify that jurisdictions are required to provide education and monitor compliance of commercial edible food generators but that this requirement excludes certain Tier Two commercial edible food generators, namely "non-local entities" and "local education agencies". Because non-local entities and local education agencies do not report to local jurisdictions, the Department is the best entity for managing the requirements of Section 18991.1 for these generators. The Department will be responsible for tracking waivers and exemptions for these groups and would be in the best position to education, monitor, and conduct outreach to these generators. • Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) A jurisdiction shall implement an edible food recovery program that shall include the actions that the jurisdiction plans to take to accomplish the following: (1) Educate commercial edible food generators <b>with the exception of non-local entities and local education agencies</b> as set forth in Section 18985.2. (2) Increase the access of commercial edible food generators <del>access with the exception of non-local entities and local education agencies</del> to edible food recovery organizations and edible food recovery services. (3) Monitor <b>the compliance of</b> commercial edible food generators <del>compliance with the exception of non-local entities and local education agencies</del> as required in Article 14. (4) Increase edible food recovery capacity if the analysis required by Section 18992.1 indicates that the jurisdiction does not have sufficient capacity to meet its edible food recovery needs. (b) A jurisdiction may fund the actions taken to comply with this section through franchise fees, local assessments, or other funding mechanisms.	Although jurisdictions will not enforce non-local entities or local education agencies, jurisdictions are still required to provide non-local entities and local education agencies with edible food recovery education and outreach pursuant to Section 18991.1 (a)(1) and Section 18985.2 of the regulations. CalRecycle would also like to clarify that jurisdictions are required to increase all commercial edible food generators' access to food recovery organizations and food recovery services including local education agencies and non-local entities located within the jurisdiction. In addition, it is clear from the definition of "non-local entity" and "local education agency" that they are not subject to the control of a jurisdiction's authority; therefore, is it implicit that jurisdictions are only to enforce on those they have authority over. CalRecycle is responsible for monitoring compliance and enforcement of those entities. Regarding the comment about CalRecycle being responsible for tracking waivers and exemptions for these groups and would be in the best position to educate, monitor, and conduct outreach to these generators, the regulatory text does not include commercial edible food generator waivers or exemptions.
3219	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	Section 18991.2. Recordkeeping Requirements for Jurisdiction Edible Food Recovery Program • Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) A jurisdiction shall include all documents supporting its compliance with Section 18991.1 in the Implementation Record required by Section 18995.2 of this chapter and shall also include at a minimum: (1) A list of commercial edible food generators <b>with the exception of non-local entities and local education agencies</b> in the jurisdiction that have arrangements with edible food recovery organizations or services. <b>Non-local entities and local education agencies are to report to the Department, as appropriate.</b>	Section 18991.2 requires jurisdictions to include all documents supporting its compliance with Section 18991.1 in the Implementation Record. To clarify, since jurisdictions are not required to monitor the compliance of non-local entities or local education agencies, jurisdictions are therefore not required to include non-local entities or local education agencies on their list pursuant to Section 18991.2 (a)(1). However, all commercial edible food generators in the jurisdiction (that are not non-local entities or local education agencies) that have established a contract or written agreement pursuant to Section 18991.3 (b) must be included on the jurisdiction's list required in Section 18991.2 (a)(1).

Comment Number	Received From	Question/Comment	Response(s)
	Integrated Waste Management Task Force comments		CalRecycle would also like to clarify that jurisdictions are still required to provide all tier one and tier two commercial edible food generators with education and outreach. This includes commercial edible food generators that are non-local entities and local education agencies. Therefore, the jurisdiction must identify all commercial edible food generators in the jurisdiction (including non-local entities and local education agencies) and include the number of all those commercial edible food generators on its list required in Section 18994.2 (h)(1).
3220	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18991.3. Commercial Edible Food Generators If a large event is held at a State-owned facility, such as a state park, the regulations should clarify that it is the responsibility of the Department to ensure compliance with this Section 18991.3. and Section 18997.2. Penalty Amounts.	To clarify, if the commercial edible food generator operating at the event or facility is subject to the jurisdiction's authority then it is the responsibility of the jurisdiction to monitor compliance and enforce. If the commercial edible food generator is not subject to a jurisdiction's authority, then is it CalRecycle's responsibility to monitor compliance and enforce.
3221	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.1. Organic Waste Recycling Capacity Planning It should be recognized that the local task force created pursuant to Section 40950 of the Public Resource Code can be an asset to the county and the cities within the county in data collection and planning efforts listed in Section 18992.1(a). • Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) "Counties in coordination with cities, <del>and</del> regional agencies located within the county, <b>and the local task force created pursuant to Section 40950 of the PRC,</b> shall:"	A change in the regulatory text is not necessary because the regulations already identify local task forces as needing to be consulted.
3222	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.1. Organic Waste Recycling Capacity Planning There is major concern with jurisdictions being required to "verify" that capacity is available to them through contracts, permits, franchise or guarantees of access documentation. Considering that there is already a shortfall in organic waste management capacity statewide, it is inevitable that some jurisdictions will be without capacity. This may result in a competitive bidding war and/or implementation of flow control by some entities. Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) (2) <b>The jurisdiction in which the facility is located, and all appropriate Regional, State and Federal non-local entities and local education agencies, shall</b> identify the amount in tons of <b>the existing</b> organic waste recycling infrastructure capacity <b>at each fully permitted facility</b> , which they are or intent to use, located both in the county and outside of the county, that is verifiably available to the county, and	CalRecycle declines the suggested change. The section at issue, as worded, provides an option for capacity demonstration but is not a requirement for demonstration.

Comment Number	Received From	Question/Comment	Response(s)
		<p>jurisdictions, non-local entities and local education agencies located within the county.</p> <p>(A) A county can demonstrate the capacity is verifiably available to the county or its jurisdictions through a contract, permit, franchise, or other documentation of the following:</p> <ol style="list-style-type: none"> <li>1. <del>A guarantee of access to existing permitted or authorized capacity at a</del> <b>A binding guarantee of access and tonnage capacity to an existing and fully permitted</b> facility, activity, operation, or property that recovers organic waste.</li> <li>2. A guarantee of access to new or expanded capacity at a <b>fully permitted</b> facility, activity, operation, or property that recovers organic waste that will be available prior to the end of the reporting period.</li> </ol>	
3223	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18992.1. Organic Waste Recycling Capacity Planning</p> <p>Cities or regional agencies are required to respond within 120 days to a county when contacted about the amount of organic waste in tons that will be disposed by the cities. A similar requirement also needs to be imposed on non-local entities and local education agencies because most likely these entities will be using facilities/capacity within the said county. Since counties are penalized financially for failing to estimate organic waste disposed, the Task Force recommends including language within this section that ensures that counties are not liable if cities, non-local entities, local education agencies or regional agencies fail to respond within the given time frame.</p> <ul style="list-style-type: none"> <li>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(b) A city, non-local entity, local education agency or regional agency contacted by a county pursuant to subdivision (a) shall respond to the county’s request for the information necessary to comply with the requirements of this article within 120 days of receiving the request from the county.</p> <p><b>(1) If a city, non-local entity, local education agency or regional agency does not provide the necessary information to the County within the required timeframe, the County will not be held liable for failing to fully comply with requirements of this Article 11. <del>report on this jurisdiction’s organic waste disposal.</del></b></p>	<p>The language was revised to accommodate this request. Language stating the following was added:</p> <p>“If a jurisdiction or regional agency fails to provide the information necessary to comply with the requirements of this article within 120 days, the county is not required to include estimates for that jurisdiction in the report it submits...”</p> <p>Non-local entities and local education agencies are not required to report information to jurisdictions under this article.</p>
3224	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18992.1. Organic Waste Recycling Capacity Planning</p> <p>The regulations state that the county shall conduct community outreach regarding locations being considered for new or expanded facilities, in- or outside the county. We recommend that this responsibility be the role of the jurisdiction (host city or host county for unincorporated area) in which the new or expanded facility is being proposed, and not solely the role of the county regardless of the location of the new or expanded facility.</p> <p>In addition, the regulations state that haulers and owners of facilities, operations, and activities that recover organic waste shall respond to the jurisdiction regarding potential new or expanded capacity at their facilities; however, it does not include “existing capacity”.</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p>	<p>The community outreach required in Section 18992.1(c)(3) is intended for the facilities or activities located within the county. Counties can work in coordination with cities to provide this outreach. Nothing precludes cities from providing outreach.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(c) In complying with this section, the <b>county, city, and/or regional agency depending on the location of the facility or activity</b> shall:</p> <p>(1) Consult with the Enforcement Agency and the local task force created pursuant to Section 40950 of the Public Resources Code on the status of locations for new or expanded solid waste facilities including the potential capacity increase each facility may provide if approved.</p> <p>(2) Consult with haulers and owners of facilities, operations, and activities that recover organic waste including, but not limited to, compost facilities, in-vessel digestion facilities, and Publicly Owned Treatment Works to gather information on the existing capacity and potential new or expanded capacity at those facilities, operations, and activities.</p> <p>(A) Entities contacted by a jurisdiction shall respond <b>within 60 days of receiving the request</b> to the jurisdiction regarding <b>existing and</b> potential new or expanded capacity at their facilities, operations, and activities, including information about throughput and permitted capacity necessary for planning purposes</p>	
3225	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18992.1. Organic Waste Recycling Capacity Planning</p> <p>The regulations state that the county shall conduct community outreach regarding locations being considered for new or expanded facilities. The regulations should clarify if this outreach must be done throughout an entire city that a new or expanded facility is being considered or within a radius of a certain number of miles from the address at which the facility is being proposed.</p> <p>For example, if a facility is being considered in City A, does the outreach need to take place in all areas of City A, only or does it need to take place within an "X" mile radius of the proposed facility?</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(3) Conduct community outreach regarding locations being considered for new or expanded facilities, operations, or activities to seek feedback on the benefits and impacts that may be associated with new or expanded facilities, operations, or activities. The community outreach shall:</p> <p><b>(A) Be conducted within a X mile radius of the location of the proposed new or expanded facility.</b></p> <p><del>(A)</del><b>(B)</b> Include at least one of the following forms of communication: public workshops or meetings, print noticing, and electronic noticing.</p> <p><del>(B)</del><b>(C)</b> If applicable be conducted in coordination with potential solid waste facility operators that may use the location identified by the county.</p> <p><del>(C)</del><b>(D)</b> Specifically include communication to disadvantaged communities that may be impacted by the development of new facilities at the locations identified by the county. If more than five percent of that community is defined as "Limited English Speaking Households," or "linguistically isolated," as defined by the U.S. Census Bureau, the jurisdiction shall provide the information required by this section in a language or languages that will assure that the information is understood by that community.</p>	The regulations regarding community outreach are worded in a manner to provide flexibility to jurisdictions on the method and scope of outreach. CalRecycle declines to put a particular mileage radius on outreach.

Comment Number	Received From	Question/Comment	Response(s)
3226	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18992.1. Organic Waste Recycling Capacity Planning</p> <p>According to SB 1383, CalRecycle, in consultation with CARB, shall adopt regulations that achieve the specified targets for reducing organic waste in landfills (i.e., a 50-percent reduction by 2020 and a 75-percent reduction by 2025). The current draft of the regulations state that a jurisdiction that lacks sufficient capacity shall “demonstrate how it will ensure there is enough new or expanded capacity to recover the organic waste currently disposed by generators within their jurisdiction by the end of the report period.” The way it is currently written, it appears that the regulations are requiring that all organic waste that is currently disposed be recovered (or planned for recovery) by the end of the report period.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(d) If a county determines that organic waste recycling capacity, in addition to the existing and proposed capacity identified pursuant to subsection (a), is needed within that county, the county shall notify the jurisdiction or jurisdictions that lack sufficient capacity that each jurisdiction is required to:</p> <p>(1) Submit an implementation schedule to the Department that demonstrates how it will ensure there is enough new or expanded capacity to recover <b>an amount of the organic waste that is equivalent to a 50-percent reduction in 2014 organic waste disposal levels by 2020, and a 75-percent reduction by 2025 currently disposed by generators within their jurisdiction</b> by the end of the report period <b>set forth in Section 18992.3 of this article.</b></p>	A change to the regulatory text is not necessary because the proposed change would entail placing a numerical limit on a jurisdiction, which is not allowed by the statute.
3227	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18992.1. Organic Waste Recycling Capacity Planning</p> <p>Including options that would require jurisdictions to plan for obtaining funding or provide financial support for expansion of organic waste recycling facilities would put an undue burden on jurisdictions. The Task Force recommends that this language be removed and replaced with other options including efforts by the Department and State to promote the development of new facilities.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(d)(1) Submit an implementation <del>schedule</del> <b>plan</b> to the Department that demonstrates how it will ensure there is enough new or expanded capacity to recover the organic waste currently disposed of by generators within their jurisdiction by the end of the report period.</p> <p>(A) The implementation <del>schedule</del> <b>plan</b> shall include <del>timelines and milestones for planning efforts to access</del> <b>strategies for ensuring</b> additional new or expanded capacity, including, but not limited to:</p>	The current provisions are necessary to ensure that jurisdictions are taking specific steps to ensure access to capacity in the future. As has been stated by many stakeholders and jurisdictions, a distinct lack of organic waste recycling capacity will be a hinderance to achieving the organic waste reduction targets by 2025. The regulations are not only designed to achieve the target by 2025, they are, and must be, designed to achieve and maintain organic waste disposal 75 percent below the 2014 levels beyond the year 2025. This requires active planning by jurisdictions to identify future needs and secure capacity. The proposed language is vague and subjective, it is unclear what minimum standard discussing ‘strategies’ could be held to.
3228	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste	<p>Section 18992.1. 	Management Committee/ Integrated Waste Management Task Force comments		
3229	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.1. Organic Waste Recycling Capacity Planning For capacity planning purposes, the regulations include “digestate and biosolids” within the organic waste material types. In the latest version of CalRecycle’s Characterization of Solid Waste in California report, these two materials are not included in the report. Since the regulations lists the waste characterization study as a means to estimate the countywide disposal, will CalRecycle provide counties with the disposal composition of these materials to assist in the capacity planning analysis? We recommend that CalRecycle provide counties with the statewide disposal composition of digestate and biosolids before the first capacity plan is due to CalRecycle on February 1, 2022.	CalRecycle has revised Section 18992.1(f) in response to this comment. The change adds another information source that can be used for this requirement. The change is necessary because statewide or local characterization studies typically do not characterize digestate/biosolid, as they are not a part of the commercial and residential waste stream. However, this information should be limited to using a published report or another form of data generated by the appropriate solid waste management entities within the county that provides organic waste disposal tonnages or percentages for digestate/biosolids. This data would be used in addition to either statewide or local characterization studies.  The RDRS system will have some reporting of the disposal and other end destinations for some digestate and biosolids (if the reporting entity is over the tonnage thresholds and is not just sending it to another POTW or if they are using it onsite). Since this data will include large generators, CalRecycle will include this data in the capacity planning tool.
3230	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.2. Organic Edible Food Recovery Capacity Counties are required to “Estimate the amount of edible food that will be disposed of by commercial edible food generators . . .”. Currently, there are no tools to quantify the amount of edible food in the disposal stream. Therefore, we recommend that CalRecycle provide Counties with a methodology to estimate the amount of edible food within the disposal stream.	CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
3231	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.2. Organic Edible Food Recovery Capacity It should be recognized the local task force created pursuant to Section 40950 of the Public Resource Code can be an asset to the county and the cities within the county in data collection and planning efforts listed in Section 18992.2 (a). In addition, the regulations should include a requirement on cities, regional agencies and edible food recovery organizations to respond to and provide the requested capacity data/information to Counties or other applicable jurisdictions for edible food capacity planning purposes. Additionally, in Section 18992.2(a)(3), counties are required to “Identify proposed new or expanded edible food recovery organizations”. Additionally, in Section 18992.2(b)(2), jurisdictions are required to “Consult with edible food recovery organizations. . . regarding existing, or proposed new and expanded capacity”. This appears to be a very repetitive requirement. We recommend that Counties be required to focus on existing edible food recovery capacity and cities (jurisdictions)	Regarding the comment that the regulations should include a requirement on cities, regional agencies, and edible food recovery organizations to respond to and provide the requested capacity data and information to counties or other applicable jurisdictions for edible food recovery capacity planning purposes. CalRecycle agrees with this comment and added language to the regulatory text specifying that if a jurisdiction or regional agency fails to provide the county with the information necessary to comply with the Article within 120 days, then the county is not required to include estimates for that jurisdiction in the report it submits pursuant to Section 18992.3. If a jurisdiction fails to comply with their requirements under Article 11, then the jurisdiction could be subject to enforcement action.  With regard to the commenter's suggested changes to the edible food recovery capacity planning requirements, a change to the regulatory text was not necessary. A change to the regulatory text was not necessary because in order for a jurisdiction to be able to implement an effective edible food recovery program it is critical that they are familiar with the food recovery organizations and services that operate in their jurisdiction and identify proposed new or expanded edible food

Comment Number	Received From	Question/Comment	Response(s)
		<p>be required to focus on the new or expanded edible food recovery capacity. Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (a) Counties in coordination with cities, <del>and</del> regional agencies located within the county, <b>and the local task force created pursuant to Section 40950 of the PRC</b> shall: (1) Estimate the amount of edible food that will be disposed of by commercial edible food generators that are located within the county and jurisdictions within the county. (2) Identify existing capacity at edible food recovery organizations that is available to commercial edible food generators located within the county and jurisdictions within the county. <del>(3) Identify proposed new or expanded edible food recovery organizations that will be used to process edible food identified pursuant to subsection (1).</del> <del>(4)</del><b>(3)</b> Identify the amount of capacity at edible food recovery organizations that is necessary to recover 20 percent of the edible food that is estimated to be disposed. <b>(b) A city or regional agency contacted by a county pursuant to subdivision (a) shall respond to the county's request for the information necessary to comply with the requirements of this article within 120 days of receiving the request from the county.</b> <b>(c) Food recovery organizations contacted by a jurisdiction shall respond to the jurisdiction regarding potential new or expanded food recovery capacity at their facilities, operations, and activities.</b> <del>(b)</del> <b>(d)</b> If a county identifies that new or expanded capacity is needed to recover the amount of edible food identified in (a)(4), then each jurisdiction(s) within that county that lacks capacity shall.</p>	<p>recovery organizations and food recovery services in case the demand for recoveries grows in their area. Even if the demand did not increase, this is still very important information to identify especially if a major food recovery organization or service stops operating in the jurisdiction. Each requirement in Section 18992.2 is critical to ensure that edible food recovery capacity is expanded, and that jurisdiction edible food recovery programs are successful. Each requirement in Section 18992.2 is in place to help ensure effective capacity planning measures are taken, which will ultimately serve to help keep edible food out of landfills, and be redirected to help feed people in need.</p>
3232	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	Section 18992.2. Organic Edible Food Recovery Capacity The Task Force recommends that this section be expanded to add a subsection including appropriate provisions for compliance by non-local entities and local education agencies a consistent with requirements of this Article 11.	Counties and jurisdictions are not required to consult with local education agencies under Article 11. It is unclear why compliance would be required. To clarify, local education agencies are commercial edible food generators. Commercial edible food generators do not have capacity planning requirements.
3233	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste	For the purpose of this Article, the discussions and requirements need to be expanded to include appropriate provisions for compliance by non-local entities and local education agencies consistent with requirements of this article.	Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor's office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.

Comment Number	Received From	Question/Comment	Response(s)
	Management Committee/ Integrated Waste Management Task Force comments		<p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.</p>
3234	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target</p> <p>While the Task Force recognizes the need and importance of market development, such efforts must be mandated by legislative authority with associated funding to assist local jurisdictions. The Task Force recommends that the requirement for local jurisdictions to procure recovered organic waste products be eliminated from the regulations, since this requirement is not supported by legislative authority.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Regarding authority, See response to General Comment 24, above. Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses. Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream. Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
3235	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/	Section 18993.1. Recovered Organic Waste Product Procurement Target In addition to compost and renewable transportation fuel, CalRecycle should add electricity generated from recycled organic waste to the list of recycled organic waste products that may be procured to meet the recovered organic waste procurement target. In-vessel digestion and biomass conversion are activities deemed to constitute a reduction in landfill disposal per Section 18983.1(b) (3) and (4) of the proposed regulations, respectively. In-vessel digestion produces biogas and biomass conversion produces syngas, both of which can be used to produce renewable natural gas (RNG) and electricity, as well as transportation fuel.	<p>"The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p>

Comment Number	Received From	Question/Comment	Response(s)
	Integrated Waste Management Task Force comments	<p>CalRecycle should be promoting, rather than limiting, the use of the recycled organic waste products that may be procured to provide jurisdictions flexibility and a variety of options to meet the procurement target. Producing compost in densely-populated urban and suburban jurisdictions can be challenging due to odors, space constraints, and permitting issues. The stringent requirements for pipeline injection of RNG transportation fuel in the state will make it extremely challenging for jurisdictions to procure RNG transportation fuel from remote production facilities and will require each jurisdiction to develop several of its own RNG production and on-site fueling facilities.</p> <p>CalRecycle needs to be a tool rather than an obstacle in promoting development of facility using emerging technologies (such as low- and mid- temperate thermal conversion technologies) to develop products in assisting the reduction of organic waste landfill disposal.</p>	<p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>
3236	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18993.1. Recovered Organic Waste Product Procurement Target Should CalRecycle pursue any mandatory procurement requirements, then CalRecycle should phase in such requirements since the availability of these products may be limited in the first few years of program implementation and jurisdictions should not be penalized if they are unable to procure the required amounts of these products.</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b> (f) For the purposes of this article, the recycled organic waste products that <del>must</del> <b>may</b> be procured are: (1) Compost. (2) Renewable transportation fuel <b>(3) Electricity</b> <b>(4) Renewable natural gas</b> <b>(5) Any other recycled organic waste products approved by the Department</b> (g) The following conversion factors shall be used to convert tonnage in the annual recycled organic waste product procurement target for each jurisdiction to equivalent volumes of recycled organic waste products: (1) One ton of organic waste in a recycled organic waste product procurement target shall constitute: (A) 19 diesel gallon equivalents, or “DGE,” of renewable transportation fuel</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. 	Integrated Waste Management Task Force comments		
3241	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18995.1. Jurisdiction Inspection and Enforcement Requirements</p> <p>There is concern with maintaining confidentiality of some information in that in order to comply with the regulations, the jurisdiction would need to provide its customer lists to CalRecycle.</p> <p>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(c) A jurisdiction shall generate a written report for each inspection, route review, and compliance review conducted pursuant to this Chapter. Each report shall include, at a minimum, the following information, <b>unless such information is restricted by a confidentiality agreement or considered proprietary information:</b></p> <p>(1) Identifying information for the subject or subjects of the inspection, route review or compliance review, such as, but not limited to:</p> <p><del>(A) The name or account name of each person or entity.</del></p> <p><b>(A B) A general description of the route and addresses location covered by a route review.</b></p> <p><b>(B C) A general description of the list of accounts reviewed for each compliance review.</b></p> <p><b>(C) A list of accounts, including addresses along with names of the account holders, determined by the jurisdiction to be subject to enforcement actions.</b></p>	<p>CalRecycle changed the requirement for a “written report” to a “written record” in 18995.1(c) to make clear that information gathered during inspections such as route reviews and compliance reviews is not required to be disclosed in a public report. These are written records that are to be maintained in the files of the local jurisdiction. To the extent that such information is valid confidential, proprietary, or trade secret information, there are protections built into the Public Records Act (Gov. Code Sections 6250 et seq.) to allow the appropriate withholding of such information from public disclosure by the jurisdiction. The proposed regulations were amended to provide for this.</p>
3242	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18996.2. Department Enforcement Actions Over Jurisdictions</p> <p>Pursuant § 42653 of the PRC, CalRecycle and CARB (not local jurisdictions) are responsible for identifying the barriers to organic waste recycling, the status of new organics recycling infrastructure development, the commitment of state funding to support infrastructure expansion, the progress in reducing regulatory barriers to the siting of organics recycling facilities, the timing and effectiveness of policies that will facilitate the permitting of organics recycling infrastructure, and the status of markets for the products generated by organics recycling facilities. Therefore, the Task Force recommends that the regulatory language include allowances for jurisdictions and other entities that demonstrate a substantial effort to comply with the regulations but are unable to do so due to factors outside of their control. Furthermore, the Task Force recommends that CalRecycle revise the regulations to incorporate provisions for jurisdictions demonstrating a “good faith effort” to comply. Public Resources Code § 42652.5 (4) states, “The department shall base its determination of progress on relevant factors, including, but not limited to, reviews conducted pursuant to Section 41825...” (See General Comment A.2.b).</p> <p>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></p> <p>(a) If the Department finds that a jurisdiction is violating one or more of the requirements of this Chapter, <b>and has not made a good faith effort to fulfill these requirements</b>, then the Department may take the following actions:</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>

3244	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18996.6. Department Inspections and Compliance Review of State Agencies and Facilities See General Comment A.1.</p> <ul style="list-style-type: none"> <li>• Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) If the Department finds that a state agency is violating Article <b>4, 5, 7, 8, 10, 11, 12</b>, or Article <b>13</b> of this chapter, then the Department may take the following progressive enforcement actions:</p> <p>(1) Issue a Notice of Violation requiring compliance within 90 days. If the state agency or state facility provides sufficient evidence that additional time is needed to comply, it may request, and the Department may grant an additional 180-day extension. The state agency or state facility extension request shall include:</p> <p>(A) An explanation of why the violations have occurred, and all steps that have been taken to comply with this chapter. (B) An explanation as to why it cannot correct the violation by the compliance date.</p> <p>(C) A proposed set of tasks and milestones necessary for the state agency or state facility to comply and an explanation and justification of the proposed timeline.</p> <p>(D) Any additional information that supports the request to delay enforcement action.</p> <p>(2) If the department issues a Notice of to a state agency or facility it shall include, but is not be limited to:</p> <p>(A) A description of the violation and regulatory section that is the basis of the violation.</p> <p>(B) Identification of the actions the state agency or state facility shall take to correct the violation(s).</p> <p>(C) The timeframe in which each of the actions must be taken.</p> <p>(D) The actions in subsection (a)(3) of this section that the Department may take if the state agency or facility fails to comply</p> <p>(3) If a state agency or state facility fails to comply with a Notice of Violation, the Department may take the following enforcement actions:</p> <p>(A) List the state agency or state facility on the Organic Waste Recovery Noncompliance Inventory described in Section 18997.4 of this chapter.</p> <p>(B) Request that the Department of General Services (DGS) conduct an audit of the state agency or state facility for compliance with Public Contract Code (PCC) Section 12217(a).</p> <p>(C) Notify the Governor.</p> <p>(D) Notify the Legislature.</p> <p><b>(E) Unless prohibited by State law, following the Legislature notification, the Department may impose administrative civil penalties on a state agency or state facility found in violation of Articles 4, 5, 7, 8, 10, 11, 12 or 13. The penalty amount shall be equivalent to those listed in Article 16 for a similar entity.</b></p>	<p>A change to the regulatory text is not necessary. Under 1383, state agencies are treated as generators rather than implementation authorities and SB 1383 did not authorize the Department to issue penalties to state agencies. The Department will not be adding enforcement requirements on state agencies. Section 18996.6 states that the Department will oversee the compliance of state agencies in respect to SB 1383. Currently, state agencies are required to meet waste diversion goals like those required for cities, counties and regional agencies under AB75. State agencies and large state facilities must adopt integrated waste management plans, implement programs to reduce waste disposal and they have their waste diversion performance annually reviewed by the Department.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>(4) The Department may not extend a compliance deadline in a Notice of Violation if the Department determines that the state agency or state facility has not made substantial efforts to comply with this chapter.</p> <p>(A) For the purposes of this section, "substantial effort" means that the state agency or state facility has taken all practicable steps to comply. Substantial effort does not include failure by the state agency or facility to take the necessary steps to comply, including, but not limited to, not providing adequate staff resources, failing to provide sufficient funding to assure compliance with the Chapter, or failure to adopt required policies</p>	
3245	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18996.7. Department Enforcement Action Regarding Local Education Agencies See General Comment A.1.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) If the Department finds that a local education agency is violating this chapter, the Department may issue a Notice of Violation requiring compliance within 90 days. If the local education agency fails to comply with the Notice of Violation, the Department may list the local education agency or a non-local entity on the Organic Waste Recovery Noncompliance Inventory pursuant to Section 18997.4.</p> <p><b>(b) Unless prohibited by State law, following the Legislature notification, the Department may impose administrative civil penalties on a local educating Agency found in violation of this chapter. The penalty amount shall be equivalent to those listed in Article 16 for a similar entity.</b></p>	CalRecycle made a policy determination during this rulemaking to not impose penalties on local education agencies out of concern regarding limited funding for local education.
3246	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18996.9. Department Enforcement Actions Against Entities See comment on 65 on Section 18996.2., and define the term "entity".</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) The Department may take enforcement action against organic waste generators, including commercial edible food generators, haulers, and food recovery organizations and services, where a jurisdiction has failed to enforce this chapter <b>and has not made a good faith effort to do so</b> or where the entity is a non-local entity that is not a state agency or facility subject to enforcement under Section 18996.6 or a local education agency subject to enforcement under Section 18996.7.</p> <p>(b) If an entity has been found in violation, the Department shall:</p> <p>(1) For a first violation:</p> <p><b>(A) Hold a public hearing, which, to the extent possible, shall be held in the entity's jurisdiction, to determine whether or not the entity has failed to make a good faith effort towards compliance. If the Department determines that a good faith effort has not been made, the Department shall issue</b> <del>issue</del> a Notice of Violation (NOV) requiring compliance within 60 days.</p> <p>(B) If the violation continues after the NOV compliance date, the Department shall issue a Notice and Order to Correct (NOTC) requiring compliance within 30 days. The NOTC shall include the potential penalties for failing to comply.</p>	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction

	Solid Waste Management Committee/ Integrated Waste Management Task Force comments	(b) What are the allowable uses of revenue generated from the collected penalties and the agency with the decision-making authority for its use?	penalties are committed to local discretion and control as informed by due process and other applicable requirements, such as Government Code Section 53069.4. Regarding uses of penalty revenue, SB 1383 was silent on this issue. As such, use of local penalty revenue is left to applicable local requirements and discretion. Department penalty revenue is required to be deposited in the Integrated Waste Management Account pursuant to Public Resources Code Section 47901 and appropriated consistent with the requirements of Government Code Section 13332.18.
3248	DeChellis. P., City of La Canada Flintridge -- refers to attached Los Angeles County Solid Waste Management Committee/ Integrated Waste Management Task Force comments	<p>Section 18997.2. Penalty Amounts See General Comment A.2.a.</p> <p>The monetary penalties for Property and Business Owners should not be based on established penalty severity levels. The penalties should have a maximum limit so as not to disproportionately penalize certified small businesses, non-profit organizations, or other entities for whom the penalties may cause substantial hardship.</p> <p>The monetary penalties for residential organic waste generators should be given their own category in Table 1 separate from all other organic waste generators. The penalties for residential organic waste generators should not be based on established penalty severity levels. The penalties should have a maximum limit so as not to disproportionately penalize economically disadvantaged communities in the state.</p> <ul style="list-style-type: none"> <li>Proposed Regulatory Text and <b>Recommended Changes/Revisions:</b></li> </ul> <p>(a) A jurisdiction shall impose penalties that are equivalent or stricter than those amounts in Table 1 of this section, <b>except in cases where these penalties may cause substantial hardship to certified small businesses, non-profit organizations, economically disadvantaged communities, or other applicable entities</b>, and shall be calculated by determining the type of violations that have occurred, the number of violations that have occurred, and the corresponding penalty level in subsection (b).</p> <p>Table 1 can be viewed in the original comment letter.</p> <p>(b) Consistent with the requirements prescribed in Government Code Sections 53069, 25132 and 36900, the penalty severity levels are as follows:</p> <p>(1) For a violation classified as Level 1, the amount of the base penalty may be \$50–\$500 per violation.</p> <p>(2) For a violation classified as Level 2, the amount of the base penalty may be \$250–\$1000 per violation.</p> <p>(3) For a violation classified as Level 3, the amount of the base penalty may be \$500–\$2,500 per violation.</p> <p>(c) For the purposes of subsection (a), revoking, suspending, or denying a permit, registration, license, or other authorization shall be considered stricter than the penalties in this section.</p>	A change to the regulatory text is not necessary. The legislature, in SB 1383, directed CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction and authorizes penalties. The Chapter allows the flexibility to consider jurisdiction's differences and unique challenges by allowing the jurisdiction to develop and adopt their own enforceable ordinances that meet or exceed the requirements of the Chapter. The penalty ranges in section 18997.2 are consistent with Government Code sections 53069.4, 25132 and 36900 which already apply to penalties levied by jurisdictions. These set the maximum penalties that local agencies may impose. Regarding fees, SB 1383 provides broad discretion for local jurisdictions to charge and collect fees to recover its costs in complying with the regulations. These regulations do not curtail that statutory authority.

Comment Number	Received From	Question/Comment	Response(s)
		<p><b>(d) For a violation classified as Level 0, certified small businesses, non-profit organizations, residents of economically disadvantaged communities, and other applicable organic waste generators may submit an application to the Department or to the jurisdiction imposing penalties requesting the penalties to be waived due to substantial economic hardship.</b></p> <p>Pursuant to Chapter 3.67 of the Los Angeles County Code and the California Integrated Waste Management Act of 1989 (Assembly Bill 939 [AB 939]), the Task Force is responsible for coordinating the development of all major solid waste planning documents prepared for the County of Los Angeles and the 88 cities in Los Angeles County with a combined population in excess of ten million. Consistent with these responsibilities and to ensure a coordinated, cost-effective, and environmentally sound solid waste management system in Los Angeles County, the Task Force also addresses issues impacting the system on a countywide basis. The Task Force membership includes representatives of the League of California Cities-Los Angeles County Division, County of Los Angeles Board of Supervisors, City of Los Angeles, the waste management industry, environmental groups, the public, and a number of other governmental agencies.</p>	
5030	DeLange, V, Delta Diablo	<p>Issue No. 1 – Green Container versus Gray Container Compliance Metrics</p> <p>The proposed regulations include very prescriptive and quantitative requirements for calculating performance and organics recovery rates for gray container waste that is sent to high diversion organic waste processing facilities (Article 6.2, Sections 17409.5.1 – 17409.5.3). However, there are no similar quantitative requirements for organic waste collected in green containers under the three-container and two-container options. This discrepancy may have the unintended consequence of favoring the multi-container options because of the lower threshold for measuring compliance. Implementing similar requirements for the green container option would allow CalRecycle to ensure strong implementation and capture/diversion of organics regardless of the collection method, while providing the metrics to evaluate the performance of the different collection methods.</p> <p>In order to reach the state-mandated 50 percent and 75 percent diversion goals, CalRecycle should support all collection methods (e.g., green container, gray container) and processing options (e.g., composting, dry digestion, and co-digestion at wastewater treatment plants). Wastewater treatment plants can play an important role in organics diversion through the utilization of existing infrastructure in the form of anaerobic digesters to co-digest food waste and other organic waste with the added benefit of producing renewable energy. However, anaerobic digesters need a specific type of organics feedstock and typically avoid organics that are mixed with green waste. The unintended consequence of not including quantitative requirements for green container systems may limit the ability of wastewater treatment plants to support organics diversion.</p>	<p>Section 18984.5 already requires all types of containers to be monitored. Instead of setting a performance standard on green containers, CalRecycle established container monitoring requirements and facility checking/monitoring. However organic waste recovery efficiency will be measured at facilities receiving source separated organic waste.</p>

Comment Number	Received From	Question/Comment	Response(s)
5031	DeLange, V, Delta Diablo	<p>Issue No. 2 – Eligible Recovered Organic Waste Products</p> <p>The District supports inclusion of language in the proposed regulations that supports development of markets for the products of digestion, including both biosolids and biogas (Article 12, Section 18993.1). However, the proposed regulations limit the eligible products for the procurement requirement to only compost and renewable transportation fuel. While the District strongly supports these end uses for organic waste, the eligible products should be expanded to include renewable electricity and pipeline injection. Because each jurisdiction and potential projects are unique, CalRecycle should include language that supports multiple pathways to support organics diversion. The District has been working with MDRR and Anaergia for over two years on ECBP development and the importance of biogas utilization options and off-take agreements are vital to its financial viability.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. Note that pipeline injection is not an eligible procurement option in order to eliminate the potential for double-counting the same gas for different procurement targets. For example, by including pipeline injection, a jurisdiction(s) could count pipeline injected gas as well as the end use of that gas. The draft regulations do not preclude renewable gas facilities from injecting gas into the pipeline, but the language has been streamlined to clarify that only the end use of that gas (transportation fuel, electricity, heating applications) will be counted towards a jurisdiction’s procurement target.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>
6168	Dingman, D., Contra Costa County	<p>§ 18981.2(a): The regulations exceed the scope of CalRecycle’s rulemaking authority under Public Resources Code section 42652.5 by mandating local jurisdictions to adopt ordinances that require compliance with the regulations. Under their Constitutional police power, counties have discretion to adopt ordinances not in conflict with general laws. Public Resources Code section 42652.5 does not purport to force a county to adopt an ordinance to mandate</p>	<p>PRC Section 42652.5 provides a broad grant of rulemaking authority to CalRecycle that includes the authority to institute “requirements for local jurisdictions” and “penalties to be imposed by CalRecycle for noncompliance.” The proposed regulations do not strip local jurisdictions of discretion in enforcing purely local ordinances. The regulations instead are requiring local jurisdictions to enforce the ordinances that they are required to adopt, under 14 CCR Section 18981.2, pursuant to a statewide, rather than purely local, regulatory program subject to Department oversight. The Legislature set ambitious organic waste diversion mandates on a short</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>compliance with these regulations, and CalRecycle has not identified any legal authority for the proposition that a county’s discretion under its Constitutional police power may be constrained by a state administrative agency through adoption of a regulation. Additionally, such a sweeping mandate is not reasonably necessary to effectuate the purpose of Section 42652.5, because CalRecycle may enforce its own regulations. (See Gov. Code, § 11342.2.)</p>	<p>timeline and robust enforcement of regulatory requirements is essential to meeting those mandates.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to ‘fill up the details’ of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste. Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, "A local jurisdiction may charge and collect fees to recover the local jurisdiction's costs incurred in complying with the regulations adopted pursuant to this section."</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance."</p> <p>Regarding the language "authorizing" penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements "and impose penalties for noncompliance." Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p>
6169	Dingman, D., Contra Costa County	§ 18981.2(a): It is not reasonable to impose a mandate that jurisdictions adopt ordinances no later than January 1, 2022, when, pursuant to Public Resources Code section 42652.5(a)(6), the mandate itself will not be effective until the regulations take effect on January 1, 2022 or later.	<p>SB 1383 mandates that these regulations go into effect on January 1, 2022 per the language of the enabling statute. It is clear the Legislature intended for the requirements to be enforceable at that time. The timing for adoption of local ordinances reflects this.</p> <p>The requirement in the proposed regulations for jurisdictions to have enforceable mechanisms consistent with the requirements of the SB 1383 regulations is not enforceable until January 1, 2022. Therefore, this requirement is not in effect until then.</p>

Comment Number	Received From	Question/Comment	Response(s)
6170	Dingman, D., Contra Costa County	§ 18984.1: Textiles and carpet are organic according to the proposed Regulations. Subsection (a) states these can go into the green or blue containers, however this is not the case in our County so if placed in either of these carts material would be considered, treated and disposed of as contamination. Language in subsection (b) allowing textiles to be placed in the grey “nonorganic waste only” container needs to be expanded to include other organic waste that is not accepted in the green carts based on local operator/facility standards. Local organics processing facilities do not accept all organic waste as proposed to be defined in these regulations, therefore as written Regulations currently require generators to place all organic waste in their organics container which would in effect mandate countless generators to contaminate their green organics containers.	The regulations already allow organics to be placed into the gray container under specified conditions.
6171	Dingman, D., Contra Costa County	§ 18984.1(a)(3): The regulations exceed the scope of CalRecycle’s rulemaking authority by mandating replacement of trash containers if not grey or black in color. The enabling statute applies to organics collection which the Regulations require be provided using a green container. Aside from the lack of statutory authority to impose trash container color requirements, there is minimal benefit that might be achieved by standardizing the color of trash receptacles (unlike standardizing colors for containers intended to hold source-separated organics and recycling which require greater care to avoid contamination). There is simply no adequate justification for such a waste-generating mandate considering standardizing trash containers will literally require disposal of at least tens of thousands of carts before the end of their useful life. Trash containers should be allowed to be any color other than green or blue, so that the thousands of brown or burgundy containers currently used for either trash or recycling in certain jurisdictions can all be used for trash eliminating the need to replace tens if not hundreds of thousands of containers statewide.	The regulations provide a broad grant of rulemaking authority to place requirements on jurisdictions to achieve the goals in statute. CalRecycle determined standardized container colors are necessary to encourage proper solid waste separation on a statewide basis to reduce container contamination and encourage diversion. CalRecycle delayed dates to replace existing containers to allow jurisdictions time to comply.
6172	Dingman, D., Contra Costa County	§ 18984.1 (a)(5)(A): Local organics processing facilities do not accept all organic waste as proposed to be defined in these regulations, This wording should be revised to identify which organic wastes are acceptable in the green organics container, acknowledging that the types allowed vary based on local operator/facility standards and permits. Either wording needs to be added or refer to a different section if adequate wording is already elsewhere, because as written wording requires generators to place all organic waste in their organics container, including types local operator considers contaminants that are not accepted for composting/recovery at local facilities (such as palm fronds, ivy, pet waste, etc.)	If the Local Enforcement Agency determines that a material type cannot be safely recycled, then a jurisdiction would be allowed to list that material as not acceptable. Additionally, during the informal workshops many other stakeholders stated that they have programs for these material types. Further human and pet waste are not required to be measured as organic waste for the purpose of measuring contamination in 18984.5. With respect to human and pet waste, a jurisdiction may prohibit human waste in the green or blue container in a 3-container system and in the green container in a 2-container system. This change is necessary in order to support jurisdiction efforts to minimize public health impacts.  This revision does not apply to pet waste, as many jurisdictions collect manure and take this material to processing facilities that have to meet pathogen reduction requirements. Regarding palm fronds and monocotyledons, while these materials have been difficult to handle at composting operations, at least one facility has opened in CA that can grind this material and use it in animal feed products, reportedly at a cost significantly less than that of landfilling. Allowing jurisdictions to prohibit this material from being placed in the green container would potentially deter the development of innovative technologies to deal with this material.

Comment Number	Received From	Question/Comment	Response(s)
6173	Dingman, D., Contra Costa County	§ 18984.5: Responsibility to address contamination is most appropriately assigned to haulers and NOT “jurisdictions”. If contamination is proposed to be a violation, said violation must be verifiable and provable by the jurisdiction which is not the case with the proposed regs which provide said determination discretion to the haulers. Additionally, It should be the responsibility of the Hauler NOT the local public agency to reduce the presence of contaminants in organic waste containers that are collected from the territory that they serve, especially in the case where the hauler is owned by the same company as the local disposal facilities and/or organic facilities used to manage the waste/material collected by said hauler in that agencies service area. The local public agency should only be required to become involved if/when the hauler fails to comply.	A change in the regulatory text is not necessary. A basic tenet of the regulations is that jurisdictions are responsible for addressing contamination. The model of delegated oversight enforcement authority is common among environmental regulations and enforcement programs. This is necessary to extend implementation and oversight of environmental regulations embodied in this chapter to the local level where compliance can be monitored by local staff more familiar with unique local circumstances. This section also ensures that compliance with the regulations is initially monitored at the local level while reserving the state’s oversight role for egregious situations, or situations where the local entity responsible for enforcement (in this case the jurisdiction) fails to act. Even so, under Section 18981.2, a jurisdiction may designate a hauler to fulfill its responsibilities through its franchise or other agreement, but the jurisdiction is ultimately responsible for ensuring that the requirements are met.
6174	Dingman, D., Contra Costa County	§ 18984.5(b)(2): The regulations exceed the scope of CalRecycle’s rulemaking authority by authorizing a solid waste hauler to dispose of collected source separated organic waste notwithstanding its contractual obligation to a local jurisdictions to do so. These provisions are inconsistent with the powers granted by the Legislature to general law counties under Government Code section 23000 to make and enforce the terms of contracts, including solid waste franchises.	This provision does not authorize a solid waste hauler to dispose of the contents, it requires that the jurisdiction perform this task. However, the jurisdiction may delegate that task to the hauler. If so, there is no inconsistency with the powers of local governments regarding solid waste franchises because the hauler is acting under the jurisdiction’s authority. To the extent a jurisdiction wants its hauler to somehow separate out the garbage from the source separated recyclables commingled in a bin – nothing in the regulations would prohibit a jurisdiction from including something about that in its contract.
6175	Dingman, D., Contra Costa County	§ 18984.8: In many cases, existing contractual arrangements are clear about the containers being property belonging to the franchise hauler. Most likely jurisdictions do not even have access to the supply in inventory, let alone know where they all are currently deployed/located, CalRecycle has no authority to require that jurisdictions physically alter property owned by another party, therefore this requirement should be imposed directly upon the entity who owns the containers, which will most often be the franchise hauler. In Contra Costa County, responsibility to place and maintain labels is most appropriately assigned to our haulers since they service and maintain containers. At the very minimum, the following language should be added to this Section: “Consistent with Section 18981.2,	It is the jurisdiction’s responsibility to ensure that its franchise agreement provisions coincide with the regulatory requirements upon the jurisdictions. Most franchise agreements contain provisions that allow for renegotiation of the terms pursuant to a change in the applicable law. The regulations do not go into effect until 2022 which gives both the jurisdictions and the haulers ample time to make the necessary arrangements. Insofar as the bin requirements are concerned, the regulations allow use of the containers until the end of their useful life before replacement. All containers must comply by 2036 which is 14 years from the effective date of the regulations.
6176	Dingman, D., Contra Costa County	§ 18984.9(b)(1): It is not advisable to specify businesses provide organic waste and nonorganic recyclables at all disposal containers. Limitations may in effect prevent businesses from complying, plus publically available containers can pose significant contamination problems. Businesses cannot prohibit customers from contaminating containers. This section should be rewritten as, “...in all areas where disposal containers are provided for customers employees, except for restrooms.”	Section 18984.9 establishes that commercial businesses must locate organic waste and recycling containers near disposal containers that customers can access at that business. It also establishes that containers provided by the commercial business conform to the containers used throughout the jurisdiction’s organic waste recovery service, as a method to further reduce customer confusion and limit contamination of collection containers. This section is necessary to allow customers of a commercial business that is an organic waste generator, the opportunity to recycle their organic waste, thereby helping to limit disposal of organic waste. As 40 percent of organic waste is generated at commercial businesses, this section helps ensure that organic waste recovery options are available in nearly all places that commercial waste is generated. It is necessary to ensure the state is able to meet the organic waste recovery targets established in the statute. This section is also necessary to ensure generators have access to organic waste recovery options wherever they discard material, including in public locations. This helps educate consumers and underscores the importance of recovering organic waste in, and outside the home.

Comment Number	Received From	Question/Comment	Response(s)
6177	Dingman, D., Contra Costa County	§ 18984.10(c): CalRecycle has failed to cite any statutory or authority to require owners to authorize entry onto their property so in the absence of the legal authority to require them to do this it would be unreasonable to require local jurisdictions to take action against them for such.	This section, and Section 18984.10 is intended to function as guidance that CalRecycle will need access to perform its inspection duties and is intended to be subject to the Fourth Amendment to the U.S. Constitution.
6178	Dingman, D., Contra Costa County	§ 18985.1(b): The February 1, 2022 date should be changed to later in the year because many jurisdictions may only learn about one or two (if any) self-haulers in the first month after the Regulations take effect, so that would be too soon to conduct annual outreach to provide to self-haulers with information regarding the requirements of Section 18988.3.	Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements. Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(c) to include all education requirements for single unsegregated collection systems.
6179	Dingman, D., Contra Costa County	§ 18988.3(b)(4): Self-haul is allowed by right and exempt from the County's requirements to operate under a franchise agreement or non-franchise hauler permit, therefore no County approval is required. We do not know who may be self-hauling at any given point in time, so we will slowly build a list of self-haulers as we learn about them (most likely identified on a case by case basis when following up with Generators not signed up for organics collection). In some cases we've learned that generators are getting paid for their organics by companies that pick it up and turn it into animal feed (consider that a product rather than waste).	Nothing in the regulation prohibits a business owner from self-hauling their organic waste. Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements. Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(c) to include all education requirements for single unsegregated collection systems. The regulations require self-haulers to keep a record but do not require self-haulers to report as it would be unnecessarily burdensome to require self-haulers to report. Language was ultimately changed to remove the annual reporting to jurisdictions for all self-haulers.
6180	Dingman, D., Contra Costa County	§ 18992.1(a) & 18992.2: The regulations exceed the scope of CalRecycle's rulemaking authority by imposing such burdensome requirements solely on counties necessitating that we gather information from nineteen cities, two regional agencies and four special districts every year in order to calculate capacity that is	SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, "CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section

Comment Number	Received From	Question/Comment	Response(s)
		currently available/planned and future needs. This is more concerning because wording indicates the requirement pertains to the County “in coordination with city or regional agencies”, which is quite unclear as to whom is accountable for applicable non-compliance penalties shown in Base Table 6 in Article 16.	<p>39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Administrative Civil Penalty tables, including “Base Table 6,” were deleted from the proposed regulations</p>
6181	Dingman, D., Contra Costa County	§ 18992.1(a)(2): A county may not have the ability to identify the organic waste recycling infrastructure capacity that is “verifiably available to the county and the jurisdictions located within the county.” To the extent that organic waste is imported into the county, the capacity used by such waste may not be available to organic waste generated within the county. While a county may be able to obtain a guarantee of access through a contract, permit, franchise or other documentation, such access would need to be negotiated, and there is no guarantee that the county would necessarily be successful in such a negotiation.	A county is not required to account for waste generated outside its boundaries. Counties are required to identify the amount of organic waste that will be generated within the county and identify locations that can recycle that material that are verifiably available to the county and its jurisdictions. The capacity does not have to be located within the county’s physical borders. It is true that one facility’s verifiably available capacity may be used by a jurisdiction located outside of the county. In this case the county and its jurisdiction may have to locate another facility or contemplate the development on new capacity so they can meet their obligation to demonstrate that they have verifiable access to organic waste recycling capacity. This is necessary to ensure the sufficient organic waste recycling capacity is available for the state to achieve and maintain the organic waste reduction targets of SB 1383.
6182	Dingman, D., Contra Costa County	§ 18992.1(a)(2): Furthermore, requiring jurisdictions to identify sufficient verifiably available capacity in order to avoid burdensome requirements will likely result in mismanagement and underutilization of facility capacity. As a result of guaranteeing local jurisdictions’ access to capacity, operators would potentially be limited from accepting organics imported from elsewhere which conflicts with Section 18990.1(b)(2) and potentially runs afoul of the commerce clause of the US Constitution.	18992.1(a)(1) is a planning requirement that requires jurisdictions to identify organic waste recycling capacity and doesn't require operators to do anything.
6183	Dingman, D., Contra Costa County	§ 18992.1(e): For the purposes of infrastructure capacity planning, organic waste should not include paper types that are recycled in blue containers or biosolids and digestate. There is no valid basis for combining biosolids, recyclable paper and other organic wastes into a single organic waste stream for the purpose of infrastructure capacity planning unless they are being comingled for processing at the same facility.	<p>Section 18992.1(c)(2) specifies that POTWs must provide requested information within a specified timeframe.</p> <p>In addition, the comment states that “organic waste should not include paper types that are recycled in blue containers or biosolids and digestate. There is no valid basis for combining biosolids, recyclable paper and other organic wastes into a single organic waste stream for the purpose of infrastructure capacity planning unless they are being comingled for processing at the same facility.”</p> <p>The capacity planning requirements require that specific types of organic waste are included in capacity planning estimates. The regulations do not require that the jurisdictions combine, or only</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>plan for infrastructure that combines those materials for recycling. Capacity planning may require jurisdictions to identify various types of infrastructure capable of recovering different types of organic waste.</p> <p>The purpose of this section is to require counties, in coordination with cities and regional agencies located within the county, to comply with provisions referenced in the following sections, and to provide CalRecycle with the ability to ensure that counties, cities, and regional agencies are cooperating on their overall organic waste capacity planning. The purpose of this section is to require that counties, and other local entities within their boundaries, work in conjunction with each other when compiling information related to estimating their organic waste tonnage, identifying existing organic waste recycling capacity, and estimating organic waste recycling capacity that will be needed. The capacity planning required by this section is necessary to ensure local jurisdictions are aware of and can address their capacity shortfalls and secure access to facilities that recovery organic waste. This will help increase organic waste recovery in California.</p>
6184	Dingman, D., Contra Costa County	<p>§ 18992.1(e):As a county, we have NO authority over the agencies that own and operate publically operated treatment works (POTWs). Agencies responsible for POTWs that generate biosolids have independent jurisdictional authority, therefore it is these agencies and not counties that must be held responsible for management of their biosolids as well as any infrastructure capacity planning requirements.</p>	<p>CalRecycle has revised Section 18992.1(f). The change adds another information source that can be used for this requirement. The change is necessary because statewide or local characterization studies typically do not characterize digestate/biosolid, as they are not a part of the commercial and residential waste stream. However, this information should be limited to using a published report or another form of data generated by the appropriate solid waste management entities within the county that provides organic waste disposal tonnages or percentages for digestate/biosolids. This data would be used in addition to either statewide or local characterization studies.</p> <p>The RDRS system will have some reporting of the disposal and other end destinations for some digestate and biosolids (if the reporting entity is over the tonnage thresholds and is not just sending it to another POTW or if they are using it onsite). Since this data will include large generators, CalRecycle will include this data in the capacity planning tool.</p>
6185	Dingman, D., Contra Costa County	<p>§ 18992.1(e):Biosolid processing capacity requirements and any associated reporting mandates must be separate from city/county organic waste infrastructure capacity planning requirements. Infrastructure capacity requirements applicable to biosolids and digestate must be imposed directly upon the POTW agencies and such agencies must be monitored by and accountable to CalRecycle and not counties due to their independent jurisdictional authority.</p>	<p>CalRecycle has revised Section 18992.1(f). The change adds another information source that can be used for this requirement. The change is necessary because statewide or local characterization studies typically do not characterize digestate/biosolid, as they are not a part of the commercial and residential waste stream. However, this information should be limited to using a published report or another form of data generated by the appropriate solid waste management entities within the county that provides organic waste disposal tonnages or percentages for digestate/biosolids. Since this data will include large generators, CalRecycle will include this data in the capacity planning tool.</p>
6186	Dingman, D., Contra Costa County	<p>§ 18992.2(a)(a): Regulations need to specify method for jurisdictions to calculate estimated amount of edible food to be discarded by edible food generators within their jurisdiction.</p>	<p>CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. Please note that this requirement does not require estimates to be exact or absent of any error or</p>

Comment Number	Received From	Question/Comment	Response(s)
			uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
6187	Dingman, D., Contra Costa County	§ 18992.2 (a)(4): This is unenforceable until such time as there is baseline data identifying how much edible food was being disposed for the purpose of determining what amount constitutes 20%. Regulations need to specify how capacity is to be calculated similar to the organic waste processing capacity section, otherwise jurisdictions will not know how to properly estimate the amount of edible food disposed in order to determine if there is adequate capacity at edible food recovery organizations necessary to recover 20% of potential edible food to be disposed.	CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. In addition, CalRecycle also intends on providing other resources to assist with completing capacity planning analyses. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
6188	Dingman, D., Contra Costa County	§ 18992.2(b): Regulations need to specify method for allocating edible food recovery capacity among local jurisdictions to manage edible food donated by generators in their respective jurisdictions. Food recovery programs do not allocate capacity to specific jurisdictions	With regard to the comment about "allocating" edible food recovery capacity and infrastructure, CalRecycle would like to clarify that there are requirements for counties in coordination with jurisdictions and regional agencies located within the county to complete capacity planning analyses and to increase capacity if sufficient capacity does not exist. Section 18991.1 (a)(4) includes the requirement that jurisdictions shall increase edible food recovery capacity if it is determined that sufficient capacity does not exist. Assessing edible food recovery capacity at the local level is critical for jurisdictions to be able to understand if capacity needs exist, and exactly what their capacity needs are. It is at the discretion of the jurisdiction to determine what jurisdiction entity is best suited to assess edible food recovery capacity and ensure that compliance with this regulatory requirement becomes a part of their scope. CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of the edible food recovery capacity planning section.
6189	Dingman, D., Contra Costa County	§ 18993.1: The regulations exceed the scope of CalRecycle's applicable rulemaking authority by imposing significant procurement mandates on local jurisdictions. SB 1383 did not provide for establishing such requirements on local jurisdictions. Even if CalRecycle was granted that authority, it most certainly would be a mandate on local agencies which warrants state reimbursement. Due to limitations in the California Constitution, state statute, and case law, the County has no feasible means of lawfully establishing a service charge, fee or assessment that could be used to cover the costs of complying with the proposed procurement requirements (this is also true for requirements pertaining to Edible Food and Infrastructure Capacity).	SB 1383 provides a broad grant of rulemaking authority to place requirements on jurisdictions to achieve the goals of the statute. CalRecycle determined that procurement requirements were necessary to achieve the diversion targets in statute by ensuring end uses for processed organic waste. Moreover, CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate. First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)). Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const.

Comment Number	Received From	Question/Comment	Response(s)
			<p>Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383. According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...” Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. [The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p> <p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
6190	Dingman, D., Contra Costa County	<p>§ 18993.1: The population based Recovered Organic Waste Product Procurement Target for Contra Costa County for 2018 equates to 7,004 tons of compost or 229,442 gallons of fuel. The County does not maintain much park land or other property where compost could be used, so that is much more compost than the County could ever make use of in a year. Likewise, the County does not have the equipment/infrastructure needed to procure and utilize such a large quantity of specialized fuel annually.</p>	<p>The procurement requirements are designed to build markets for recovered organic waste products, which is an essential component of achieving the highly ambitious organic waste diversion targets mandated by SB 1383. CalRecycle developed an open and transparent method to calculate the procurement target that is necessary to help meet the highly ambitious diversion targets set forth by the Legislature. CalRecycle has also revised section 18993.1 to expand the list of eligible recovered organic waste products to provide jurisdictions with even more flexibility to choose product that fit local needs.</p>
6191	Dingman, D., Contra Costa County	<p>§ 18995.1: The date specified in subsection (a)(1) needs to be changed to later in the year. It is completely unreasonable to require jurisdictions to complete a compliance review of all garbage accounts (which may total hundreds if not thousands of accounts) a mere 30 days after these proposed Regulations may take effect. Likewise, it is inappropriate to require completion of route reviews in that same first 30 day period.</p>	<p>A change to the regulatory text is not necessary. CalRecycle has revised section 18994.2 in response to this comment. If a jurisdiction submits its initial compliance report pursuant to section 18994.1 by April 1, 2022, a jurisdiction may submit its first report, covering the period of January 1, 2022 through June 30, 2022, on October 1, 2022. The Department will conduct a mid-year review (6 months) of the jurisdiction's compliance and implementation with the requirements of this Chapter. This will allow CalRecycle an opportunity to assist jurisdictions in the implementation phase of the regulations. Most of the information required in the Annual Reporting can be assembled prior to the October 1, 2022 due date. The following Annual Report will cover January 1, 2022-December 31, 2022 and will be due August 1, 2023.</p>

Comment Number	Received From	Question/Comment	Response(s)
6192	Dingman, D., Contra Costa County	<p>§ 18995.1(a)(1)(B)(5): The regulations exceed the scope of CalRecycle’s rulemaking authority under Public Resources Code section 42652.5 by requiring local jurisdictions to take specified enforcement actions in the event of each and every violation and subjecting them to penalties for failing to do so. There is no suggestion in Section 42652.5 that the Legislature intended to strip local jurisdictions of discretion in the enforcement of their ordinances, and no suggestion that the Legislature contemplated the imposition of such penalties on local jurisdictions.</p>	<p>PRC Section 42652.5 provides a broad grant of rulemaking authority to CalRecycle that includes the authority to institute “requirements for local jurisdictions” and “penalties to be imposed by CalRecycle for noncompliance.”</p> <p>The proposed regulations do not strip local jurisdictions of discretion in enforcing purely local ordinances. The regulations instead are requiring local jurisdictions to enforce the ordinances that they are required to adopt, under 14 CCR Section 18981.2, pursuant to a statewide, rather than purely local, regulatory program subject to Department oversight.</p> <p>The Legislature set ambitious organic waste diversion mandates on a short timeline and robust enforcement of regulatory requirements is essential to meeting those mandates.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to ‘fill up the details’ of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. Comment Number	Received From	Question/Comment	Response(s)
			<p>Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development. Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream. Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste. Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
6193	Dingman, D., Contra Costa County	<p>§ 18995.1(b): It is not reasonable to impose a requirement on local jurisdictions to “ensure” compliance with the regulations by conducting a “sufficient number” of compliance reviews, route reviews and inspections, as finding even one violation would mean that, despite its best efforts, the jurisdiction had failed to “ensure” compliance. Under Section 18996.2, the failure to “ensure” compliance would be a violation that would subject the local jurisdiction to enforcement action. There is no indication in Public Resources Code section 42652.5 that the Legislature intended that local jurisdictions bear ultimate responsibility for and be subject to penalties for all failures by any person to comply with the regulations.</p>	<p>The language addressed in this comment was modified in the proposed regulations in favor of language that reflects a requirement for an inspection and enforcement program that is “designed to ensure” overall compliance. There is no standard in this section that requires that the inspection and enforcement program achieve 100% compliance.</p>
6194	Dingman, D., Contra Costa County	<p>§ 18995.3(a)(3)(E): If a complainant is anonymous, it would be impossible for a local jurisdiction to notify the complainant of the results of a complaint investigation. Sentence needs to be added clarifying this section does not apply to complaints made to a local jurisdiction anonymously, as there would be no means of communicating with the anonymous complainant to provide notification.</p>	<p>CalRecycle revised 18995.3 was amended to clarify that a jurisdiction is only required to notify the complainant of the results of an investigation if the identify and contact information of the complainant is known.</p>
6195	Dingman, D., Contra Costa County	<p>§ 18995.3(b): CalRecycle has not cited a statute that would exempt from disclosure under the Public Records Act the names and contact information of complainants. Unless there is an authorizing statute, local jurisdictions may not be able to comply with a regulation that requires such information to be kept confidential upon request. If a complainant provides their contact information to the public agency, said information is subject to disclosure upon request unless, one of the exceptions specified in the Public Records Act applies.</p>	<p>Section 18995.3 was substantially amended during the rulemaking process and the requirement to maintain confidentiality is no longer in the regulatory language.</p>
6196	Dingman, D., Contra Costa County	<p>§ 18995.4(a): The regulations exceed the scope of CalRecycle’s rulemaking authority under Public Resources Code section 42652.5 by mandating local jurisdictions to take enforcement action against any entity found in violation of the regulations. CalRecycle has not identified any statute authorizing counties, in their capacity as local government entities, to enforce state regulations. CalRecycle may enforce the regulations itself or create a program to designate local agencies as enforcement</p>	<p>Public Resources Code Section 42652.5(a)(1) explicitly contemplates CalRecycle requiring “local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.”</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>agencies that may enforce regulations in return for state funding; for this reason, pursuant to Government Code section 11342.2, it is not necessary to impose enforcement obligations on local agencies. Additionally, even if counties had authority to directly enforce state regulations, there is no suggestion in Section 42652.5 or elsewhere that the Legislature intended to strip local jurisdictions of any enforcement discretion.</p>	
6197	Dingman, D., Contra Costa County	<p>§ 18995.4(a)(3): The regulations exceed the scope of CalRecycle’s rulemaking authority under Public Resources Code section 42652.5 by mandating local jurisdictions to impose penalties on all violators. The statute provides that the regulations may authorize – not mandate – penalties on generators, and does not provide any authority to CalRecycle to either authorize or mandate local jurisdictions to impose penalties on any persons other than generators. Comment also applies to Section 18995.1(a)(1)(B)(5) which states that jurisdictions are required to determine, document and if necessary, take enforcement action for any organic waste generator, selfhauler, hauler, or commercial edible food generator, or other entity determined to be out of compliance.</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to ‘fill up the details’ of the statutory scheme.”</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6198	Dingman, D., Contra Costa County	<p>§ 18996.1, 18996.2 &amp; 18996.3: The regulations exceed the scope of CalRecycle’s rulemaking authority under Public Resources Code section 42652.5 by setting forth a mechanism for CalRecycle enforcement oversight over local agencies. Specifically, this enforcement oversight mechanism is not necessary pursuant to Government Code section 11342.2 because the enforcement obligations that CalRecycle seeks to impose on those local agencies also exceed the scope of CalRecycle’s rulemaking authority, as discussed in the comment on Section 18995.4(a).</p>	<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6200	Dingman, D., Contra Costa County	<p>§ 18996.5: If it was necessary for local jurisdiction to take enforcement action, then it must also be necessary for CalRecycle to take action. Since it is not necessary for CalRecycle to take enforcement action, it is similarly not necessary to impose require that local jurisdictions do so. If adopted as proposed, these Regulations impose numerous requirements that are not “reasonably necessary to effectuate the purpose of the statute” and would therefore not be valid or effective pursuant to Government Code Section 11342.2.</p>	<p>Public Resources Code Section 42652.5(a)(1) explicitly contemplates CalRecycle requiring “local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.”</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p>

Comment Number	Received From	Question/Comment	Response(s)
			Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.
6201	Dingman, D., Contra Costa County	§ 18996.5(b): Large waste generators that have locations in more than one jurisdiction can be quite uncooperative and often unresponsive until someone from a regional or corporate office gets involved. It is unreasonable, not to mention terribly inefficient, to try and mandate that local jurisdictions conduct inspections and issue Notices of Violations for individual locations in each respective jurisdiction prior to referring to CalRecycle for enforcement. What is the point of referring to CalRecycle for enforcement if local jurisdictions have already taken enforcement action individually. Furthermore, it is not realistic to expect that a local jurisdiction would know enough about locations in neighboring jurisdictions to suspect non-compliance. Local jurisdictions will waste a lot of time at a minimum (after struggling to figure out how to contact region or corporate), or even worse in some cases may never even be able to gain access in order to conduct an inspection. CalRecycle needs to accept responsibility for referrals if local governments' are unable to inspect or confirm violation after repeated attempts. It makes sense that CalRecycle take the lead if needing to involve regional/corporate offices because CalRecycle staff would likely find them more responsive that if it was just a local city staff person. More importantly CalRecycle staff would potentially be in a position to address locations in more than one jurisdiction all at once and if in violation impose multiple concurrent penalties, which would certainly have a greater impact and hopefully spark the necessary corrective actions.	A change to the regulatory text is not necessary. Section 18996.5 requires jurisdiction to attempt to remedy the issue before referring the entity to the Department.
6202	Dingman, D., Contra Costa County	§ 18997.2(a) and Table 1: The regulations exceed the scope of CalRecycle's rulemaking authority under Public Resources Code section 42652.5 by mandating local jurisdictions to impose penalties in the amounts set forth, in two respects. First, cities and counties through their governing boards have discretion under the police power in the California Constitution to adopt ordinances. It is within the purview of those governing bodies to determine appropriate fines within the ranges authorized by statute and justified under Constitutional limitations that prohibit excessive punishment. CalRecycle does not have rulemaking authority to substitute its judgment for that of the elected governing bodies of local governments by mandating penalties for violations of local ordinances.	The initial language in Section 18997.2 regarding administrative civil penalties imposed by local jurisdictions was revised to be consistent with Government Code Sections 25132, 36900, and 53069.4 in response to comments.
6203	Dingman, D., Contra Costa County	§ 18997.2(a) and Table 1: The regulations exceed the scope of CalRecycle's rulemaking authority under Public Resources Code section 42652.5 by mandating local jurisdictions to impose penalties in the amounts set forth, in two respects... Second, the proposed Level 2 and Level 3 fines are not consistent with Government Code sections 53069.4 or 25132 to the extent that they mandate fines for second, third and subsequent violations of a requirement without regard to when the violations occur . The above cited statutes authorize fines that exceed \$100 only for second or additional violations that occur within one year of the first violation.	The initial language in Section 18997.2 regarding administrative civil penalties imposed by local jurisdictions was revised to be consistent with Government Code Sections 25132, 36900, and 53069.4 in response to comments.

Comment Number	Received From	Question/Comment	Response(s)
6204	Dingman, D., Contra Costa County	§ 18997.2(c): While this subsection defines what would be considered “stricter” than the stated penalties, it is not clear what would constitute an “equivalent” penalty.	The language at issue in this comment has been deleted from the proposed regulations.
6205	Dingman, D., Contra Costa County	<p>A definition for the term “entity” still needs to be added. In the absence of a definition of the term “entity,” many provisions within these regulations are not clear. It is used in nearly every Article, often it is used as follows to describe whom jurisdictions are obligated to monitor for enforcement purposes: generators, haulers and other entities.</p> <p>Local jurisdictions most likely do not have authority over all types of “entities” that may be intended, however it is difficult to be certain without defining the term. It isn’t clear what is meant when Chapter refers to “entities” within a jurisdiction’s authority. To the extent this phrase refers to any and all entities located within a jurisdiction’s boundaries, it would include all private residences as well as many lawfully operated businesses that are not included in any permit programs. Absent consent to an inspection, or cause to inspect and a warrant, local jurisdictions could not lawfully inspect these locations. CalRecycle would have to conduct inspections authorized under Article 15 for any locations that local jurisdictions could not lawfully inspect.</p>	<p>CalRecycle did not include a definition for “entity” because it is using the term in the regulations consistent with the commonly understood dictionary definition of the word as opposed to a specialized term requiring regulatory clarification. The term “entity” is used thousands of times in various state statutes without definition for the same reason.</p> <p>Regarding commenter’s concern regarding use of the phrase “...and other entities,” this phrase appears almost exclusively in the “General Provisions” portion of the regulations at Sections 18981.1 and 18981.2 and is intended to be a catch-all term for entities that are subject to explicit regulation under this rulemaking (eg. food recovery services and organizations) that are not otherwise listed in those sections. In Section 18981.2, the phrase is further limited to other entities “subject to the jurisdiction’s authority...” This is intended to exclude certain entities like state agencies, federal facilities, special agencies and other such entities that are not subject to a local jurisdiction’s regulatory authority. See the definition of “non-local entity” in Section 18982(a)(42).</p> <p>CalRecycle agrees that any inspections are subject to Fourth Amendment requirements. CalRecycle agrees that a jurisdiction is not obligated to undertake inspections or other enforcement action against entities outside of their regulatory jurisdiction. Inspection and enforcement against a “non-local entity,” as appropriate, would be undertaken by CalRecycle</p>
6206	Dingman, D., Contra Costa County	<p>Not all types of organic waste is suited or accepted for curbside collection, so the Regulations should more clearly and narrowly define the types of organic waste that must be placed in the green containers. It would be more appropriate to specify that the types of organic wastes which need to be collected separately match the definition of “organic waste” for the purpose of AB 1826 compliance. PRC Definition: “Organic waste” means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.</p>	<p>Comment noted. CalRecycle disagrees that the definition of organic waste is too broad, or should be limited to the types of organic waste included in the definition used in AB 1826. SB 1383 requires CalRecycle to reduce the disposal of organic waste. These reductions are required as a means of achieving the methane emission reduction targets of the SLCP Strategy. AB 1826 only requires that collection services be offered to commercial businesses. SB 1383 requires the state to reduce the disposal of organic waste that is landfilled, it is a substantially broader legislative mandate and requirement. Organic waste that break down in a landfill and create methane must therefore be included in the regulatory definition, including organic waste that are not generated by commercial businesses. Organic waste defined in the regulation are subject to specific requirements (e.g. collection, sampling etc). These requirements are necessary to achieve the purpose of the statute.</p>
6207	Dingman, D., Contra Costa County	<p>The revised definition for the term “jurisdiction” is an improvement as it now clearly assigns responsibilities applicable to Organic Waste Generators, Edible Food Generators and Haulers to the city, county or special district with authority over the collection service franchise for each applicable service area. However, there are multiple sections in which the term jurisdictioni is used when the intended reference seems to be only cities, counties or regional agencies (old definition of jurisdiction).</p>	<p>While the commenter does not cite a specific section, CalRecycle reviewed the entire regulatory text and where appropriate specified for certain articles that the term jurisdiction as used in that article is specific to a subset of “jurisdictions.” For example, in Article 12, the following language was added, “For the purposes of this section, “jurisdiction” means a city, a county or a city and county.”</p>
6208	Dingman, D., Contra Costa County	<p>Government Code section 42652.5 authorizes local jurisdictions to charge and collect fees to recover its costs of compliance with the regulations to be adopted by CalRecycle. However, CalRecycle should not have the ability under this section to require the local jurisdiction to demonstrate that it has adequate budget resources</p>	<p>It is unclear to what fee limitations and regulatory requirements for “adequate budget resources” the commenter is referring. Language regarding “adequate budget resources” is not contained in the proposed regulations. Section 18996.2(a)(2)(B) does contain provisions disallowing extensions of Corrective Action Plan timelines in circumstances where, among other situations, a jurisdiction</p>

Comment Number	Received From	Question/Comment	Response(s)
		to implement all of the provisions of the regulations, because a local jurisdiction may not have legal authority under other statutes or the California Constitution to impose charges that are sufficient to fund all of the mandated enforcement activities.	has failed to provide sufficient funding to ensure compliance. However, there are no explicit provisions in the proposed regulations requiring specific budgeting levels by local jurisdictions.
6209	Dingman, D., Contra Costa County	Since the regulations cannot take effect until January 1, 2022, the regulations should not impose a requirement that local jurisdictions take action prior to that date – the correct wording should be “no later than” rather than “on or before.”	SB 1383 mandates that these regulations go into effect on January 1, 2022 per the language of the enabling statute. It is clear the Legislature intended for the requirements to be enforceable at that time. The timing for adoption of local ordinances reflects this. The requirement in the proposed regulations for jurisdictions to have enforceable mechanisms consistent with the requirements of the SB 1383 regulations is not enforceable until January 1, 2022. Therefore, this requirement is not in effect until then.
6383	Dingman, D., Contra Costa County	Furthermore, there are a number of details that jurisdictions would be required to report one month after the Regulations take effect (February 1, 2022), including submitting copies of adopted ordinances and confirmation of compliance with container color requirements. The process to adopt ordinances requires more than one month to complete, so this reporting requirement is unreasonable.	CalRecycle has revised section 18994.1 in response to this comment. A jurisdiction shall report its initial compliance report to the Department on April 1, 2022.
6384	Dingman, D., Contra Costa County	Furthermore, jurisdictions with numerous generators and multiple franchise haulers will need more than one month to make compliance determinations about all containers meeting the applicable requirements.	CalRecycle has revised section 18994.1 in response to this comment. A jurisdiction shall report its initial compliance report to the Department on April 1, 2022.
6385	Dingman, D., Contra Costa County	All reporting obligations should be changed to the standard August 1st dates at the very minimum.	A change to the regulatory text is not necessary. CalRecycle has revised section 18994.2 in response to this comment. If a jurisdiction submits its initial compliance report pursuant to section 18994.1 by April 1, 2022, a jurisdiction may submit its first report, covering the period of January 1, 2022 through June 30, 2022, on October 1, 2022. The Department will conduct a mid-year review (6 months) of the jurisdiction's compliance and implementation with the requirements of this Chapter. This will allow CalRecycle an opportunity to assist jurisdictions in the implementation phase of the regulations. Most of the information required in the Annual Reporting can be assembled prior to the October 1, 2022 due date. The following Annual Report will cover January 1, 2022-December 31, 2022 and will be due August 1, 2023.
6386	Dingman, D., Contra Costa County	What does CalRecycle assert provides the legal authority necessary to adopt regulations which impose penalties on jurisdictions for not enforcing requirements imposed in regulations but not the legislature?	<p>PRC Section 42652.5 provides a broad grant of rulemaking authority to CalRecycle that includes the authority to institute “requirements for local jurisdictions” and “penalties to be imposed by CalRecycle for noncompliance.”</p> <p>The proposed regulations do not strip local jurisdictions of discretion in enforcing purely local ordinances. The regulations instead are requiring local jurisdictions to enforce the ordinances that they are required to adopt, under 14 CCR Section 18981.2, pursuant to a statewide, rather than purely local, regulatory program subject to Department oversight.</p> <p>The Legislature set ambitious organic waste diversion mandates on a short timeline and robust enforcement of regulatory requirements is essential to meeting those mandates.</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with CalRecycle’s broad rulemaking authority, the proposed procurement requirements are designed to help achieve the organic waste diversion goals in SB 1383 by supporting markets for recovered organic waste products. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p> <p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p> <p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled</p>

			<p>authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6389	Dingman, D., Contra Costa County	What provides CalRecycle with the legal authority necessary to adopt regulations that impose penalties on jurisdictions for not enforcing requirements imposed in regulations but not the legislature (SB 1383)?	<p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. 6393	Dingman, D., Contra Costa County	What provides CalRecycle with the legal authority necessary to undermine or overrule matters that fall under the purview of governing bodies of individual jurisdictions, such as what ordinances to adopt and what if any penalties shall be imposed for any alleged violations?	Public Resources Code Section 42652.5(a)(1) explicitly contemplates CalRecycle requiring “local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.”

			<p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. [The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6394	Dingman, D., Contra Costa County	Why is CalRecycle specifying penalty amounts that jurisdictions must impose for violation of local ordinances that are in excess of what counties are allowed to impose under existing statute (Government Code)?	CalRecycle has revised section 18997.2 in response to this comment. The penalty table for penalties imposed by the jurisdiction has been removed. A jurisdiction shall impose penalties for violations consistent with the graduated penalty amounts authorized in Sections 53069.4, 25132 and 36900 of the Government Code which is outlined in Section 18997.2(a).
6395	Dingman, D., Contra Costa County	How can CalRecycle impose penalties on a county for simply refusing to impose penalties that are deemed unlawful (exceed what is allowed under the Government Code)?	<p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. The regulations have a direct nexus to achieving those organic waste diversion goals by preventing initially diverted organic waste from being disposed due to lack of end uses.</p> <p>Health and Safety Code Section 39730.8, also in SB 1383, refers to CalRecycle considering recommendations in the California Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for the use of biomethane and biogas. The IEPR recommended that “state agencies should consider and, as appropriate, adopt policies and incentives to significantly increase the sustainable production and use of renewable gas.” As such, provisions for the procurement of renewable transportation fuel generated from recovered organic waste.</p> <p>The Air Resources Board’s Short Lived Climate Pollutant Strategy states, “CalRecycle will continue to work towards strengthening state procurement requirements relative to use of recycled organic products.”</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>The inclusion of compost as an eligible recovered organic waste procurement product aligns with policies and mandates for methane reduction as described in the Air Resources Board’s SLCP Strategy. The Economic Analysis conducted for the SLCP Strategy notes several scenarios that can achieve the needed reductions in short-lived climate pollutants from the waste sector, and every scenario modeled includes new compost facilities. The purpose of a compost procurement requirement is to establish markets for compost, which is a product generated by organics recycling facilities which the SLCP Strategy identified as in need of market development.</p> <p>Regarding paper procurement requirements, CalRecycle’s 2014 Waste Characterization Study found that paper accounts for 17.4 percent of the disposed waste stream.</p> <p>Requirements on jurisdictions to meet the recycled content paper procurement requirements will help grow markets for recycled content paper. Given the prevalence of paper in the disposal stream, increased procurement of recycled paper is needed to grow the market for recycled paper in order to achieve the organic waste reduction goals. This is necessary to help achieve the organic waste diversion goals in SB 1383 by ensuring an end use for diverted organic waste.</p> <p>Regarding funding, SB 1383 (Public Resources Code Section 42652.5(b)) provides that, “A local jurisdiction may charge and collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations adopted pursuant to this section.”</p>
6396	Dingman, D., Contra Costa County	There are inaccurate assertions regarding “Local Mandate and Fiscal Determinations” in the INITIAL STATEMENT OF REASONS. The requirements imposed under the proposed Regulations do in fact impose mandates on local agencies that require State reimbursement pursuant to the California Constitution.	<p>CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.</p> <p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, “No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.” Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a “tax” under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
6397	Dingman, D., Contra Costa County	Government Code section 42652.5 authorizes local jurisdictions to charge and collect fees to recover its costs of compliance with the regulations to be adopted by CalRecycle. However, CalRecycle should not have the ability under this section to require the local jurisdiction to demonstrate that it has adequate budget resources to implement all of the provisions of the regulations, because a local jurisdiction may not have legal authority under other statutes or the California Constitution to impose charges that are sufficient to fund all of the mandated enforcement activities.	It is unclear to what fee limitations and regulatory requirements for “adequate budget resources” the commenter is referring. Language regarding “adequate budget resources” is not contained in the proposed regulations. Section 18996.2(a)(2)(B) does contain provisions disallowing extensions of Corrective Action Plan timelines in circumstances where, among other situations, a jurisdiction has failed to provide sufficient funding to ensure compliance. However, there are no explicit provisions in the proposed regulations requiring specific budgeting levels by local jurisdictions.
6398	Dingman, D., Contra Costa County	What grants CalRecycle the legal authority necessary to impose such burdensome and potentially unreasonable procurement requirements on individual? What if the jurisdiction can't use (or require others to use/procure on its behalf) as much of either/both type of products as would be required to meet its procurement target?	<p>SB 1383 provides a broad grant of regulatory authority to the Department in Public Resources Code Section 42652.5, “The department, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that the Department may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, the Department also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. 6399	Dingman, D., Contra Costa County	<p>§ 18993.1(b)(2): The California Department of Finance does not report data for all applicable jurisdictions required to comply with SB 1383 (meaning cities, counties, regional agencies and special districts with authority over collection of organic waste). It is inappropriate to impose procurement target upon a County for the entire unincorporated area population if it only has authority over the collection services provided to roughly half of its population. How is the population going to be broken down by jurisdiction for the purpose of calculating jurisdictional procurement targets if not broken down by jurisdiction where special districts have authority over waste collection services, as is the case for unincorporated Contra Costa County?</p>	<p>The recovered organic waste product procurement target only applies to cities and counties. Due to overlap between a city’s population and the population of a special district, the regulation was narrowed to only apply the procurement targets to cities and counties. Procurement targets will be assigned to each city and county based on population data published by the Department of Finance (DOF). The individual city or county is ultimately responsible for compliance with the procurement requirements, regardless of whether waste collection responsibilities are delegated to another entity. The procurement target is linked to the waste created by the population that resides within the city, not the number of generators provided a collection service. Whether the city or another entity provides the service is irrelevant, the residents of the city are creating waste and the city is responsible for procuring a minimum amount of recovered organic waste products to mitigate the impacts of that waste creation.</p> <p>It is the intent of Article 12 for jurisdictions to work with special districts and similar entities to meet the jurisdiction’s procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU).</p>

Comment Number	Received From	Question/Comment	Response(s)
6400	Dingman, D., Contra Costa County	How is each jurisdiction expected to determine (calculate) amount of edible food discarded by generators within their jurisdiction?	CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. In addition, CalRecycle also intends on providing other resources to assist with completing capacity planning analyses. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
6401	Dingman, D., Contra Costa County	Who would be subject to enforcement action if county is unable to determine organic waste/edible food capacity needed & under what authority is such imposed?	To clarify, if a county fails to provide the estimates that are required by Article 11, then the county could be subject to enforcement action. CalRecycle added language to the regulatory text specifying that if a jurisdiction or regional agency fails to provide the county with the information necessary to comply with the Article within 120 days, then the county is not required to include estimates for that jurisdiction in the report it submits pursuant to Section 18992.3. If a jurisdiction fails to comply with their requirements under Article 11, then the jurisdiction could be subject to enforcement action.
6402	Dingman, D., Contra Costa County	How is each jurisdiction expected to determine (calculate) amount of edible food capacity available to each jurisdiction?	CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. In addition, CalRecycle also intends on providing other resources to assist with completing capacity planning analyses. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.
6403	Dingman, D., Contra Costa County	What grants CalRecycle the legal authority necessary to impose requirements that jurisdictions adopt and enforce local ordinance(s) to address the statewide mandates in SB1383?	<p>PRC Section 42652.5 provides a broad grant of rulemaking authority to CalRecycle that includes the authority to institute “requirements for local jurisdictions” and “penalties to be imposed by CalRecycle for noncompliance.”</p> <p>The proposed regulations do not strip local jurisdictions of discretion in enforcing purely local ordinances. 6404	Dingman, D., Contra Costa County	What provides CalRecycle the authority to impose trash and non-organic recycling container color requirements?	SB 1383 provides a broad grant of regulatory authority to CalRecycle to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This

Comment Number	Received From	Question/Comment	Response(s)
			authority includes creation of rules designed to implement these statewide mandates and ensure that the statewide organic requirements are met. CalRecycle has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals.
6405	Dingman, D., Contra Costa County	What provides CalRecycle the authority to impose requirements that is widely known to increase contamination of organics thereby compromising ability to recover said organics?	SB 1383 provides a broad grant of regulatory authority to CalRecycle to impose requirements on jurisdictions in order to achieve the organic waste diversion goals of a 50-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75-percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2025. This authority includes creation of rules designed to implement these statewide mandates and ensure that the statewide organic requirements are met. CalRecycle has determined that the mandatory collection service requirements and container color and labeling provisions are necessary to maintain consistent standards throughout the state to reduce contamination of organic waste and ensure that collected organic waste is clean and recoverable in order to meet the aforementioned diversion goals.
6337	Donlevy, J., City of Winters	Additionally, we remain concerned about critical points that hinder our ability to implement the proposed regulation. As a small city of 7000 residents we do not have the staffing available to implement and monitor the demands SB 1383 is proposing.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
6338	Donlevy, J., City of Winters	The regulations will also place a huge burden on many of our small businesses. The proposed regulations will be extremely challenging for existing businesses in the older section of downtowns with limited space availability.	A change to the regulatory text is not necessary but comment is noted. A text change is not necessary because the commenter gave an example in support of the space waiver granted by jurisdictions.
6103	Drane, N., County of Sacramento	The proposed SB 1383 regulatory language is too punitive in nature. The regulation is centered on the restriction of certain materials from certain containers. These restrictions are enforced through a series of annual inspections and reviews of organics generators, which result in violations and fines. The draft SB 1383 regulations mandate fines for all generators found in violation even though the	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations "may include penalties to be imposed by the Department." This text clearly authorizes CalRecycle

Comment Number	Received From	Question/Comment	Response(s)
		<p>legislation itself would only authorize, not mandate jurisdictions to impose penalties. These fines are detailed in 11 pages of the regulation text and range from \$50 to \$10,000 per day depending on the generator's violation.</p> <p>The County believes that this is the wrong approach, particularly for our residents. Our experience has found coercive or punitive approaches do not gain public cooperation, but rather decreases participation and increases activities to bypass the violations, such as illegal dumping. We recommend the regulatory approach emphasize enhanced generator education and incentive programs that attract generators to participate and that discretion for imposing penalties remain at the jurisdictional level.</p>	<p>to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for 5053 waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.</p> <p>A change to the regulatory text is not necessary. The legislature, in SB 1383, directed CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction and authorizes penalties. The Chapter allows the flexibility to consider jurisdiction's differences and unique challenges by allowing the jurisdiction to develop and adopt their own enforceable ordinances that meet or exceed the requirements of the Chapter. The penalty ranges in section 18997.2 are consistent with Government Code sections 53069.4, 25132 and 36900 which already apply to penalties levied by jurisdictions. These set the maximum penalties that local agencies may impose. Regarding fees, SB 1383 provides broad discretion for local jurisdictions to charge and collect fees to recover its costs in complying with the regulations. These regulations do not curtail that statutory authority.</p>
6104	Drane, N., County of Sacramento	<p>SB 1383 and the draft regulations represent a significant expenditure mandate to local jurisdictions with little financial support from the State of California. This regulation will require Sacramento County to expand its organics collection fleet, hire new staff to comply with outreach and enforcement requirements, make significant improvements to existing facilities, develop new organic processing facilities, and administer the capacity planning programs for organic waste recycling and edible food recovery for jurisdictions within the County. The fiscal impact on our residents and businesses will be immediate and hefty. The County estimates that our customer monthly rates could increase by over 50%. We request that Cal Recycle consider the overall fiscal impact of the proposed requirements, especially under such short timeframes.</p>	<p>Comment requests evaluation of fiscal and economic impacts. These were considered in the SRIA.</p>
6105	Drane, N., County of Sacramento	<p>Cal Recycle has proposed excessive route reviews, facilities inspections, waste characterizations, and reporting requirements. More is not always better, especially with the proposed language. Quarterly route reviews, annual facility inspections, characterization of waste every 500 tons, and documentation of every interaction a service provider has with their customers adds to the cost of a jurisdiction's program without commensurate additional value. Furthermore, the draft regulations do not provide any threshold or defined level of contamination allowed during these required inspections and route reviews.</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>We believe this will create substantial confusion amongst operators, residents, and businesses, additionally diluting the intent of the draft regulations. We ask that CalRecycle take an alternative approach to data collection and ask itself “What do we need?” as opposed to “What can we get?” when formulating these requirements. In addition, we request Cal Recycle to define acceptable levels of contamination to help facilitate clear expectations, such as contamination over 5% by weight shall be documented.</p>	<p>These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6106	Drane, N., County of Sacramento	<p>The goals and compliance dates required by the draft SB 1383 regulations are unrealistic due to the lack of existing processing facilities. There are no solid waste facilities permitted to process food waste in Sacramento County. Even CalRecycle estimates that 80 to 90 new facilities will be needed to meet the demands of SB 1383. Sacramento County estimates development of local facilities will take between 5 and 10 years. Sacramento County requests CalRecycle explore a legislative solution to this issue.</p> <p>Adjustment of the 2022 deadline for source separated collection of residential organics to 2027 would result in a goal that is more achievable for jurisdictions subject to SB 1383. The legislation requires that regulations take effect on or after January 1, 2022, thus it appears Cal Recycle has the ability to adjust the effective date of the regulation start date.</p>	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.</p>
6107	Drane, N., County of Sacramento	<p>Handling of residential food waste in the green containers will require substantial improvements to Sacramento County solid waste facilities. Greenwaste traditionally has been collected, stored temporarily, and transferred at open-air facilities. Introduction of food waste in the greenwaste will require that material be managed inside covered facilities. Improvements at Sacramento area solid waste facilities to transfer organic wastes are estimated in the tens of millions of dollars. Development of new local processing facilities would likely cost in excess of \$100,000,000 and would unlikely be operational by 2022. Again, delay of the 2022 deadline for</p>	<p>Comment noted. 6108	Drane, N., County of Sacramento	Section 20700.5 The draft language introduces new requirements on landfill operations that are burdensome to the continued operation of these essential facilities. CalRecycle proposes to triple the thickness of long-term intermediate cover. CalRecycle proposes this change with no technical evidence that the existing Landfill Methane Rule is not effective in limiting methane emissions from landfills.	CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments. The section was removed and the requirement was included as part of the Status Impact Report (SIR). The SIR was amended to add the requirement to identify areas in the landfill that would remain with intermediate cover. The addition of this requirement to the SIR ensures that areas with intermediate cover are maintained to meet the intermediate cover criteria of controlling the infiltration of precipitation into waste, vectors, fires, odors, blowing litter, and scavenging to reduce threats to public health and safety and the environment.
6109	Drane, N., County of Sacramento	Additionally, the draft regulation requires that new or expanding landfills implement organic waste recovery activities while providing little definition of what constitutes expanding or recovery activities.	A change to the regulatory text is not necessary. 27 CCR Section 20750.1(c) defines the term “expanding” which means a solid waste landfill proposing to make a significant change to the design or operation pursuant to 27 CCR 21665. As noted in Subdivision (c)(1), a significant change does not include a change in hours of operation of a landfill. The purpose of this section is to require new or expanding solid waste landfills to implement an organic waste recovery activity for any waste received that has not been processed previously at a High Diversion Organic Waste Processing Facility or Designated Source Separated Organic Waste Facility. Organic waste recovery activities include composting facilities or operations, in-vessel digestion facilities or operations, and other activities listed under Section 18983.1(b). Landfills that do not have available land or the finance to implement an organic waste recovery activity on-site have the option to transport the waste off-site to another facility where a recovery activity can take place.
6110	Drane, N., County of Sacramento	Section 21695. Finally, the draft language requires submittal of an Organic Disposal Reduction Status Impact Report, which is essentially an out of sequence 5-year Joint Technical Document review. Sacramento County recommends these regulation modifications be removed from consideration	CalRecycle has revised Section 21695 in response to comments. The changes to the regulatory text include the requirement that operators identify those areas in the landfill that would remain with intermediate cover and to extend that date for submittal of the Status Impact Report (SIR) from 180 days to one year (365 days) from the effective date of these regulations.  This standard is not duplicative of a five-year Joint Technical Document review. The purpose of the SIR is to assist operators better understand the potential impact the proposed regulations could have on their landfill which is different than the five-year review. A five-year review is completed by the EA every five years from the last review and evaluates (among other things) the information provided in the application for the proposed facility to determine whether or not the facility will be able to operate in accordance with state minimum standards and permit terms and conditions.

Comment Number	Received From	Question/Comment	Response(s)
			<p>Whereas, the SIR is a site specific, one-time submittal that is prepared by the operator after they have reviewed their landfill operations to determine any potential impacts from the reduction of organic disposal (waste flow) to their landfill. The one-year timeframe established in this regulation for the submittal of the SIR is intended to assist the operator in determining and assessing in the timing of those impacts in order properly implement any changes or modifications to the landfill in a timely manner. Because only the potential impacts associated with the reduction of the amount waste disposed will be reviewed, staff believe that one-year from the effective date of the regulations is an adequate amount of time for the operator to meet the requirements of this section.</p> <p>In addition, this section provides a list of items to be considered by the operator in order to assist them complete the SIR. This information in items listed is needed in order to adequately evaluate the potential impacts to the landfill resulting from the reduction of organic disposal at landfills.</p>
6111	Drane, N., County of Sacramento	The County requests that CalRecycle insert “good faith effort” language that may be authorized within the framework of the legislation. The short timeline for compliance with the new regulations and the significant required change in generators’ behavior, makes a “good faith effort” clause essential to the successful implementation of new programs for both the State and local jurisdictions.	The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction
6112	Drane, N., County of Sacramento	(71) “Supermarket” means a full-line, self-service retail store with gross annual sales of two million dollars (\$2,000,000), or more, and which sells a line of dry grocery, canned goods, or nonfood items and some perishable items. Delete -- The definitions of grocery store and supermarket are redundant. Only one definition is needed.	In some cases, grocery stores and supermarkets could be separate entities. For example, some 10,000 square foot grocery stores will not have gross annual sales of \$2,000,000 or more, yet they could still have a significant amount of edible food available for food recovery. Therefore, it was important that the two commercial edible food generators were defined separately.
6113	Drane, N., County of Sacramento	65) “Route review” means a visual inspection of containers along a hauler route for determining container contamination, and may include mechanical inspection methods such as the use of cameras. Proposed: “Route review” means a visual inspection of a <u>statistically significant number of randomly selected</u> containers along a hauler route for determining container contamination, and may include mechanical inspection methods such as the use of cameras. Inspection of all organic containers annual will be extremely labor intensive. Sacramento County services 155,000 accounts. A 2-person team of our route auditors can inspect 250 accounts per day. To inspect all organics accounts annually,	Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction.

Comment Number	Received From	Question/Comment	Response(s)
		620 team days would be needed. This equates to 5 full time equivalent employees or over \$500,000 in labor alone.	
6114	Drane, N., County of Sacramento	Proposed language: (A) The material has been processed at a solid waste facility, as defined in Section 40194 of the Public 18 Resources Code. <u>Processing shall consist of contaminate removal and reduction of size to 12-inches or less.</u> What constitutes processed?	Section 18982(a)(56) defines "Processing" as having the same meaning as 14 CCR Section 17402(a)(20). Section 17402(a)(20) defines "Processing" as the controlled separation, recovery, volume reduction, conversion, or recycling of solid waste including, but not limited to, organized, manual, automated, or mechanical sorting, the use of vehicles for spreading of waste for the purpose of recovery, and/or includes the use of conveyor belts, sorting lines or volume reduction equipment. Recycling Center is more specifically defined in section 17402.5 (d) of this Article.
6115	Drane, N., County of Sacramento	Proposed language: 1) The green container shall be provided for the collection of organic waste... The contents of the green container shall be transported to a facility that recovers source separated organic waste <u>or transport to another site where those activities occur.</u> The requirement that the contents of organic and recyclable container can only be transported to a facility that processes the waste does not allow these materials to be transported to a transfer operation or facility before being sent to a subsequent facility for processing. This practice is common in rural areas or areas lacking the processing infrastructure.	Article 3 allows the contents of containers to be initially transported to a consolidation site.
6116	Drane, N., County of Sacramento	Re section 18984.1: 2) The blue container... Proposed language: <u>or transport to another site where those activities occur.</u>	Article 3 allows the contents of containers to be initially transported to a consolidation site.
6117	Drane, N., County of Sacramento	Proposed language: (1) Property owners shall provide information to new tenants <u>before or within 14 days of upon</u> occupation of the premises. The actual date of occupation of the tenant can be hard to determine sometimes (may be moving in over a week or two). Allow more flexibility to provide before move-in or within 14 days.	CalRecycle revised Section 18984.10(b)(1) in response to this comment. This change is necessary to specify the time frame for providing information, recognizing that the actual date of occupancy can vary.
6118	Drane, N., County of Sacramento	See proposed language. Disposal of any container that has not meet the end of its useful life should not be considered. This is a wasteful proposal and will result in a larger GHG impact.	Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container. The regulations allow for replacing the container at the end of its useful life or by Jan. 1, 2036.
6119	Drane, N., County of Sacramento	Proposed language: (1) De Minimis Waivers...(B) A jurisdiction shall annually verify <u>at least every five years</u> that the commercial businesses' organic waste generation meets the waiver thresholds set forth in this subdivision. Too onerous and not an efficient use of resources to have to inspect every year verifying the threshold, specifically on the smallest generators.	CalRecycle has revised the verification period to five years in response to this comment. Thank you for the support comment. This comment is in support of the current language.
6120	Drane, N., County of Sacramento	Simply re-state the waiver described in (a) (1) (A) (1) and (2) as "If a commercial business generates less than 20 gallons of organic waste per week, that business is exempt from this Section."	As explained in the FSOR, 10 and 20 gallons respectively equate to roughly 10 percent of waste generation for small businesses that produce 2 cubic yards and 1 cubic yard of organic waste for that specific container per week. This de minimis threshold was established based on input from

Comment Number	Received From	Question/Comment	Response(s)
		Too onerous and not an efficient use of resources to have to inspect every year verifying the threshold, specifically on the smallest generators.	stakeholders while also ensuring that these waivers do not compromise the state's ability to achieve the organic waste reduction targets. CalRecycle has revised the verification period to five years in response to this comment.
6121	Drane, N., County of Sacramento	See proposed language Given the ability of modern collection containers to control potential vector and nuisance issues, allowing the Local Enforcement Agency to provide a waiver to allow every other week collection of all containers, including green containers, will provide the LEA an opportunity to weight in and possibly prevent the estimated 25% increase in equipment (collection trucks) and staffing as well as the carbon emissions and the enormous cost that this more frequent collection will create. This also better delivers on the purpose of SB1383 to reduce greenhouse gas emissions.	Nothing in the regulations exempts jurisdictions from existing public health and safety requirements regarding the requirement to collect waste in a manner that does not create threats to public health and safety. The language regarding collection waivers specifies that the jurisdiction must demonstrate to the enforcement agency that a collection frequency waiver will not impact the receiving solid waste facilities ability to comply with solid waste facility permitting standards related to protecting public health and safety from the handling of solid waste. CalRecycle cannot verify that a green or gray container would not include putrescible waste, it is likely that at least one container, which ever contains food will be putrescible. Which is why approval for 14 day collection is subject to review by the EA.
6122	Drane, N., County of Sacramento	proposed language: (b) Waivers issued pursuant to subdivision (a) shall be good for a period of up to five years and shall be subject to approval Section (a) (2) allows low population areas in unincorporated portions of the county to be eligible for a waiver. The use of census tracts in unincorporated areas seems to work for rural areas although the proposed requirement should reference a time reference and source for the density determination. Although this population density by census tract does work for many areas, there needs to also be an allowance to add additional low population areas that are less than the 50 people per square mile but are still within a census tract that is larger than 50. Many census tracts are established along natural features like rivers and artificial structures like roads. There are many census tracts where the population is located on the fringe of the census tract but most of the census tract is under the 50-population density. These low population areas may not even have contracted collection services and the roads are not designed to withstand vehicle traffic. This waiver process should also allow for inclusion of other low population areas that are not included in the census tract designations. Section (b) only allows the waiver for a period of two years. This is an extremely short period of time given the time needed to determine the efforts to implement organics programs in that area and submit an application for a waiver. CalRecycle has 90 days to review and approve the waiver. A two-year time limit will essentially require a jurisdiction to spend effort to start the application for an additional waiver upon approval of the waiver. It is unlikely that circumstance in these low population areas will change within two years. We recommend a five-year cycle for renewal of these waivers.	CalRecycle added that a special district that provides solid waste collection services or a regional agency can apply for a waiver. The change is necessary to clarify that a special district that provides solid waste collection services and a regional agency would also be eligible to apply for any of the waivers in this section. CalRecycle revised Section 18984.12(a) regarding low-population waivers for areas that lack collection and processing infrastructure, specifically to include cities with disposal of less than 5,000 tons and total population of less than 7,500, and census tracts in unincorporated areas of a county that have a population density of less than 75 people per square mile. Making these changes results in an increase of 0.5% in the amount of organic waste disposal that is potentially exempted. CalRecycle also added a new subsection (d) regarding waivers for specified high-elevation areas where bears create problems with food waste collection containers. CalRecycle initially proposed allowing waivers only for incorporated cities that disposed of less than 5,000 tons of solid waste in 2014 and that had a total population of less than 5,000, and for unincorporated areas of a county that had a population density of less than 50 people per square mile. Under these provisions, if waivers were granted to all eligible entities, then the total amount of organic waste disposal that would potentially be exempted would be 3.6% of total organic waste disposal in the state. Numerous stakeholders suggested revisions to this section to expand the number and type of areas eligible for these waivers. In response, CalRecycle analyzed how allowing one or more of the following to be eligible would impact organic waste disposal: 1) cities with disposal of less than 5,000 tons and total population of less than 7,500 or 10,000; 2) cities with disposal of less than 5,000 tons but with no population limit; 3) census tracts in unincorporated areas of a county that have a higher range of population densities (e.g., 75, 100, 250 people per square mile); 4) jurisdictions with populations > 5,000 people and that are low-income disadvantaged communities with no organic processing facilities within 100 miles; 5) cities that are entirely disadvantaged communities under CalEPA's definitions (see <a href="https://oehha.ca.gov/calenviroscreen/sb535">https://oehha.ca.gov/calenviroscreen/sb535</a> ); 6) areas with less than 50 people per square mile but which are located within a census tract with greater than 50 people per square mile; and 7) rural areas as defined under Section 14571(A) of the California Beverage Container Recycling and Litter Reduction Act.

Comment Number	Received From	Question/Comment	Response(s)
			<p>As noted above, CalRecycle revised Section 18984.12(a) to include two of the recommended alternatives. However, most of the other alternatives would result in much large amounts of organic waste disposal being potentially exempted. For example, replacing the existing rural waiver with one based on Section 14571(A) or increasing the census tract threshold to 250 to 500 people per square mile would both result in much greater amounts of tons of organic waste disposal being potentially exempted. CalRecycle also did not accept the proposed alternative to only use the &lt;5000 tons threshold because all of the affected jurisdictions have organics processing facilities within 100 miles. CalRecycle also did not accept the proposed revision to allow submittal of reasonable jurisdiction-proposed alternatives, because this is too open-ended and it was not clear what the basis would be for evaluating the reasonableness of such proposals. Absent clear objective standards the proposal is unworkable. Lastly, CalRecycle did not accept the proposals to allow waivers for all disadvantaged communities, because many of these communities are located in urban areas where collection and processing is readily available, and this would exempt a substantial portion of the organic waste stream.</p> <p>The established elevation allows flexibility for jurisdictions that face specific waste collection challenges while still achieving the legislatively mandated goals. CalRecycle analyzed the amount of organic waste exempted by all of the waivers in order to determine if the regulations could still achieve the organic waste diversion and greenhouse gas reduction goals established in SB 1383. Allowing an elevation waiver on case by case basis or for jurisdictions with a well-document history of animal instruction is not quantifiable, therefore the Department cannot determine if this waiver would impede achieving the goals mandated by SB 1383. CalRecycle compared the map of jurisdictions eligible for the elevation, low population, or rural waivers and found it to overlap considerably with the Department of Fish and Wildlife’s black bear habitat map. CalRecycle understands that bears and other wildlife do not adhere strictly to elevation thresholds. CalRecycle, however, had to set an elevation threshold in order to quantify the organic waste that would not be diverted from landfills with this waiver. Quantifying the amount of waiver organic waste diversion was critical in order to determine if the waiver would impede achieving SB 1383’s organic waste diversion and greenhouse gas reduction goals. Many census tracts in the counties the comment identifies will be eligible for other exceptions granted by CalRecycle. Additionally, the elevation waiver is limited in scope and jurisdictions that qualify for this waiver will still be subject to other 1383 requirements, including procurement, edible food recovery, and other types of organic waste collection. Allowing submittal of jurisdiction-proposed alternatives is too open-ended and it is not clear what the basis would be for evaluating the reasonableness of such proposals. CalRecycle agrees that most low-population areas that are granted a waiver by CalRecycle are likely to remain as qualifying low-population areas for longer periods of time; allowing a waiver to be operational for a longer period of time is warranted and will reduce the costs of compliance. CalRecycle has made a language change in response to this comment.</p> <p>After the change was made, commenters were in support that low population waivers are good for five years instead of two.</p>
6123	Drane, N., County of Sacramento	proposed language: Upon finding <u>5% by weight</u> (or some amount that is clearly defined, besides zero) of prohibited container contaminants in a container, the	During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a

Comment Number	Received From	Question/Comment	Response(s)
		<p>jurisdiction, or its designee, shall contact the generator or provide written notice to the generator.</p> <p>Enforcement must be realistic and acknowledge that contamination will occur even by the most conscious generators. Jurisdictions should not be penalized for small amounts of contamination if following other practices.</p> <p>We support a regulation that strives for zero contamination because it is simplest to verify, and works toward the goal of creating quality compost.</p> <p>However, during implementation CalRecycle must allow for enforcement practices that allow flexibility for very minimal contaminants that may be relatively easily sorted out in pre-processing. Currently, we don't give a contamination violation if it appears minimal such as one or two items.</p> <p>Jurisdictions should not be penalized because they did not fine generators for minimal contamination or illegally dumped contamination. Allow flexibility during enforcement for very minimal contaminants to acknowledge that all contaminants are not equal (10 plastic bottles vs 2 glass bottle vs one engine block vs one milk carton). Furthermore, by defining a threshold of allowed contaminants, will allow Jurisdictions to focus on the worst offending generators.</p>	<p>particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6124	Drane, N., County of Sacramento	<p>See proposed language</p> <p>Without knowing the threshold of contaminants, it is likely every load from a generator will have some trace of contaminates and the frequency of write-ups will be so high the write-ups will lose any impact on changing behavior. It would be overly burdensome to have to transfer photo files monthly. Alternatively, only make it so you transfer photos if the generator has contaminants on more than three occasions to align with (b) (3).</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6125	Drane, N., County of Sacramento	<p>re section: 18984.5: Allow flexibility during enforcement for very minimal contaminants to acknowledge that all contaminants are not equal (10 plastic bottles vs 2 glass bottle vs one engine block vs one milk carton). Alternatively, even better, provide a threshold of allowable contaminants, as source separated organics will go through further processing.</p>	<p>During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p> <p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term ‘physically.’ This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of “route review” in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6126	Drane, N., County of Sacramento	<p>Proposed language: (3) If the jurisdiction observes prohibited container contaminants in a generator’s green container or blue container on more than three consecutive occasions, the jurisdiction may impose additional contamination processing fees on the generator, and may impose penalties, <u>or remove the cart from service.</u></p> <p>Local jurisdictions should be allowed to remove a repeat violator customer's recycling or organic cart from service. Removal from service is the only way to resolve issues with some repeat offender accounts. This action also prevents continued contamination of the recycling streams.</p>	<p>A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter. The Department wanted to ensure a fair playing field for all entities and to identify that jurisdictions have the primary responsibility in monitoring compliance and taking enforcement on entities failing to comply with the chapter. A compliance review is intended to be a “desk audit” to verify that all solid waste accounts for commercial businesses, that generate two cubic yards or more per week of solid waste, are subscribing to service or self-hauling organic waste to a facility that processes source separated organic waste or to a high diversion organic waste processing facility, whichever if applicable. The regulations allow the jurisdiction flexibility when conducting a “sufficient number of route reviews and inspections.” Jurisdiction may prioritize route reviews and inspections to large generators or entities it determines to be more likely out of compliance. If an entity is found to be noncompliant between</p>

Comment Number	Received From	Question/Comment	Response(s)
			January 1, 2020 through December 30, 2023, jurisdictions are required to provide educational material describing the applicable requirements of this Chapter.
6127	Drane, N., County of Sacramento	Proposed language: A jurisdiction <u>or its designee</u> shall provide collection containers to generators.... Reinstate "or its designee" or use "its authorized hauler". As currently proposed, this statement could be interpreted as making the jurisdiction responsible for providing containers to commercial accounts.	The regulations already allow for a jurisdiction to designate certain responsibilities to designee.
6128	Drane, N., County of Sacramento	re section 18985.1 (a) -- Items 2, 3, 4, 5, and 6 are also applicable to generators with singlecontainer organic waste collection service. Single-container systems should also be educating generators.	CalRecycle revised Section 18985.1(d) to provide consistency in required education and outreach requirements for the three different container service options.
6129	Drane, N., County of Sacramento	proposed language: Prior to February 1, 2022, and annually thereafter, <u>to the extent that a jurisdiction has information about self-haulers</u> , a jurisdiction shall provide to self-haulers information regarding the requirements of Section 70.3 of this chapter. If a jurisdiction has a transfer station or other facility in their jurisdiction, they can provide self-haul customers with information, but otherwise they may not have knowledge of who is self-hauling, especially if they are cash customers.	CalRecycle deleted requirements that jurisdictions specifically identify and educate self-haulers in response to this comment. Jurisdictions can meet the requirement to educate self-haulers by including information oneself-hauling in their general education and outreach material provided to all generators. CalRecycle deleted language requiring solid waste facility operators to educate self-haulers as it would be overly burdensome and is outside the scope of what EAs monitor at solid waste facilities. This change was made to provide the least burdensome approach and still achieve the required disposal reduction. Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements. Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(c) to include all education requirements for single unsegregated collection systems.
6130	Drane, N., County of Sacramento	Proposed language: (f) If more than five percent of a jurisdiction's generators are defined as Limited English Speaking Households,"...the jurisdiction shall provide the information required by this section in a language or languages that will assure the information is understood by those generators <u>and/or by graphics</u> that will assure the information is understood by those generators. Graphics can transcend languages.	Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.
6131	Drane, N., County of Sacramento	re sections 18986.1 and 18986.2 -- Non-Local Entities and Local Education Agencies should be required to report to local jurisdiction regarding their efforts related to outreach to employees in a fashion similar to all generators.	It is not necessary to require this specific set of generators to report to the department or jurisdictions in order to achieve the purpose of the statute. Jurisdictions are required to monitor generators subject to their authority for compliance, but generators are not specifically required to report information to jurisdictions under the regulations.

Comment Number	Received From	Question/Comment	Response(s)
6132	Drane, N., County of Sacramento	<p>re: 18988.3            (b) 3 and 4 -- Remove these requirements.            Requiring businesses who self-haul organic waste material to record and report to the Jurisdiction is burdensome to both the generator and Jurisdiction. Self-haul tonnages can be recorded and reported at the recovery facility.</p>	<p>Jurisdictions are not required to identify every self-hauler. They are required to adopt an ordinance that requires compliance and provide general education about self-hauler requirements.            Many comments noted that it would be difficult to identify and provide education information to all self-haulers, such as landscape companies, because jurisdictions do not have business license information on these entities; dedicating additional resources to identifying and educating all self-haulers would be burdensome and costly. Some jurisdictions do require businesses that self-haul, back-haul, share service, or use a third-party independent recycler to submit a Certification of Recycling Service form with information about where they are taking the recyclables or organics. CalRecycle modified deleted the requirements that jurisdictions separately identify and provide education to all self-haulers, along with associated reporting requirements. CalRecycle added a new Section 18985.1(a)(7) to require jurisdictions to include educational material on self-hauling requirements in the educational material that the jurisdictions already are required to provide to all generators. CalRecycle revised Section 18985.1(b) to include all education requirements for single unsegregated collection systems.</p>
6133	Drane, N., County of Sacramento	<p>Proposed language: Remove or (b) A jurisdiction shall not implement or enforce an ordinance...that do any of the following:            (3) Limit the export outside of organic waste to a facility, operation, property or activity outside of the jurisdiction that recovers the organic waste through a method identified in Article 2 of this chapter <u>when there is not an organic waste facility, operation, property or activity that recovers the organic waste through a method identified in Article 2 of this chapter, located within the jurisdiction.</u>            While the goals of directing organics to recovery facilities wherever they may be found (whether inside the jurisdiction or for “export”) is laudable, this provision inherently takes away a tool (controlling waste flow by ordinance) that jurisdictions have traditionally used to integrate a solid waste management system as a whole as well as ensure the financial viability of particular facilities. Limiting that ability is counterproductive and we recommend removing it in its entirety and therefore we recommend removing the language, however, we have presented alternative language that could still allow a jurisdiction to control the flow if there are opportunities to recycle organics per Article 2.</p>	<p>A change to the regulatory text is not necessary. Section 189901 (c) (4) provides that this section does not prohibit a jurisdiction from arranging through a contract or franchise for a hauler to transport organic waste to a particular solid waste facility or operation for processing or recovery. Nothing in the regulations prohibits facilities from contracting with various parties, including jurisdictions, for capacity within their facility. What the regulations do prohibit is a jurisdiction adopting an ordinance or similar restriction to legally prohibit material from other jurisdictions from going to facilities within its boundaries simply because of where the material originated. This is consistent with existing case-law.</p>
6134	Drane, N., County of Sacramento	<p>re 18992.2 -- Will Cal Recycle be providing methodology for calculating estimates of amount of edible food and the capacity of generators to recover 20%?</p>	<p>CalRecycle intends on developing a tool to assist counties, jurisdictions, and regional agencies with estimating the amount and types of edible food that will be disposed by commercial edible food generators that are located within the county and jurisdictions within the county. In addition, CalRecycle also intends on providing other resources to assist with completing capacity planning analyses. Please note that this requirement does not require estimates to be exact or absent of any error or uncertainty. Rather it requires that each estimate is defensible and conducted in compliance with the requirements of Section 18992.2.</p>
6135	Drane, N., County of Sacramento	<p>proposed language: February <u>August 1</u>, 2022 counties shall report...</p>	<p>The regulatory language was changed to August 1, 2022 to align with other reporting requirements in existing programs.</p>

Comment Number	Received From	Question/Comment	Response(s)
		Align with EAR dates requested in Section 18994.2 (a). Moreover, jurisdictions will be in the throes of implementation in February, so would be more effective to allow more time for reporting.	
6136	Drane, N., County of Sacramento	<p>See proposed language</p> <p>The renewable transportation procurement concept is defined too narrowly. Procurement of energy from any biogas source for public use should be allowable. For example, anaerobic digestion of organics in a POTW digester generates methane that can be converted to electricity and used to power the POTW, substituting for “brown” power purchased from an electric utility. But Article 12 allows only vehicle fuel use to count toward the procurement requirement. This seems overly limiting.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p> <p>CalRecycle has also revised the regulatory language to add mulch provided it is derived from certain solid waste facilities and the jurisdiction requires such material to meet land application environmental health standards."</p>
6137	Drane, N., County of Sacramento	<p>Proposed language: Commencing August 1, <u>2023</u>, and annually thereafter, a jurisdiction shall report the information required by this section. The report submitted in 2023 shall cover the period of January 1, 2022-June 30, 2022. Each subsequent report shall cover the entire previous calendar year.</p> <p>One month (July 2022) is significantly too short a time to pull together the extensive reporting required for a Jan to Jun 2022 time period, especially for the first report. It's also repetitive for the full calendar year 2022 to be reported in Aug. 2023.</p>	<p>A change to the regulatory text is not necessary. CalRecycle has revised section 18994.2 in response to this comment. If a jurisdiction submits its initial compliance report pursuant to section 18994.1 by April 1, 2022, a jurisdiction may submit its first report, covering the period of January 1, 2022 through June 30, 2022, on October 1, 2022. The Department will conduct a mid-year review (6 months) of the jurisdiction's compliance and implementation with the requirements of this Chapter. This will allow CalRecycle an opportunity to assist jurisdictions in the implementation phase of the regulations. Most of the information required in the Annual</p>

Comment Number	Received From	Question/Comment	Response(s)
			Reporting can be assembled prior to the October 1, 2022 due date. The following Annual Report will cover January 1, 2022-December 31, 2022 and will be due August 1, 2023.
6138	Drane, N., County of Sacramento	re 18994.2 (i)(1)(b) -- Further clarity needed as to what "verifiability available" means. Would a jurisdiction report on the edible food recovery service or organization ability to collect food?	To clarify, the amount of capacity 'verifiably available' to the county and cities within the county means the amount of capacity that the jurisdiction has verified exists and is available for use. To clarify the question about jurisdiction reporting, jurisdictions are required to report to counties and counties are required to report to CalRecycle.
6139	Drane, N., County of Sacramento	proposed language: A jurisdiction shall generate a written report <u>or keep electronic records</u> for each inspection, route review, and compliance review conducted pursuant to this Chapter Our Department is moving to electronic documenting. Providing a written report for every inspection would be overly burdensome. And not environmentally friendly.	CalRecycle has revised section 18995.1 in response to this comment. The section will allow electronic reports for each inspection, route review and compliance review.
6140	Drane, N., County of Sacramento	proposed language: (1) On or before January 31, 2023, and at least <u>every two years</u> thereafter, a jurisdiction shall conduct the The regulation will not be effective until 2022. Requiring compliance reviews within the first month of the regulation being effective is not practical. Additionally, annually compliance reviews are burdensome and not cost effective given the number of commercial and residential routes.	A change to the regulatory text is not necessary. The statute states the regulations shall take effect on or after January 1, 2020. The compliance reviews are expected to be conducted sometime during the year 2020 and then annually each year for all solid waste collection accounts for commercial businesses. The legislature anticipated and contemplated early action to adopt the regulations and meet the interim organic waste reduction goal set for 2020. The success of the SCLP Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Postponing the start date and frequency of compliance reviews contradicts this timeline.
6141	Drane, N., County of Sacramento	See proposed language Annual verification of waivers is overly burdensome. De minimus or space constraints are unlikely to change for businesses over time. Annual verification would take significant effort for local jurisdictions.	CalRecycle has revised the verification period to five years in response to this comment.
6142	Drane, N., County of Sacramento	re: 18995.1 -- "Sufficient number" should be defined. A Jurisdiction may have a significantly different interpretation of this language verses Cal Recycle's inspectors.	A change to the regulatory text is not necessary. The language in this subsection was worded in such a way to allow the requirement for inspections to be tailored to the unique circumstances of each jurisdiction. This allows the jurisdiction the flexibility to conduct the number of inspections needed to have an overall picture of the compliance of generators under their authority and to ensure their own compliance with the Chapter. Jurisdictions shall have an inspection plan on how they will be conducting their inspections, such as but not limited to, inspecting entities that may be more likely to be out of compliance or focusing on large generators.
6143	Drane, N., County of Sacramento	See proposed language. The proposed time frames are too aggressive. The Operational Record will be significant in size. It will likely take jurisdictions more than a day to make it available. Additionally, 30 days to compile such records from the wide variety of sources is not feasible.	CalRecycle has revised section 18995.1 in response to this comment. Section 18995.1 now allows ten business days for a jurisdiction to provide access to the Implementation Record when requested by the Department and allows records and information to be included in the Implementation Record within 60 days.
6144	Drane, N., County of Sacramento	see proposed language. 90 Days is insufficient for Jurisdictions to complete modification of local ordinances. 180 days is a reasonable time frame.	CalRecycle has revised section 18996.1(e) in response to this comment. The change increases the relevant timeline to 180 days.
6145	Drane, N., County of Sacramento	proposed language: "If Department staff investigate or take enforcement action against any entity residing or conducting business in a Jurisdiction, Department staff	A change to the regulatory text is not necessary. The Department may take enforcement action against an entity when the jurisdiction has failed to enforce and after the provisions in Section 18996.3 (a)(1) and (a)(2) are met.

Comment Number	Received From	Question/Comment	Response(s)
		<p>must disclose specifically, prior to investigating or taking enforcement action, that they are not acting on behalf of the Jurisdiction."</p> <p>If CalRecycle staff interject enforcement into the relationship between the Jurisdiction and its customers, or between Franchisees and their customers, the potential for damage to that customer - service provider relationship will occur. That damage must be mitigated as much as possible by complete disclosure of the nature of the enforcing party.</p>	<p>Section 18996.3 states the Department will notify the jurisdiction prior to taking enforcement action against an entity. The Department will take enforcement action on an entity if the jurisdiction fails to do so. The notice will include a general description of the grounds for the Department's action. A jurisdiction can prevent the Department from taking enforcement action against entities under the jurisdictions authority by adhering and enforcing the regulations as required.</p>
6146	Drane, N., County of Sacramento	<p>see proposed language</p> <p>SB 1383 adopted legislation does not require jurisdictions to adopt ordinances to penalize generators; rather it "authorizes" jurisdictions. Therefore, we suggest changing the "shall" to "may." Further, we ask you rethink the negative-toned approach to these four articles and return with an approach in which the State facilitates positive, market-based incentives that lead to funding and siting new and enlarged organics diversion facilities and/or increased financial support for local organics recycling efforts. The types of behavior changes required to implement effective organics programs provokes strong emotional reactions from some members of the community. People will react to the proposed citations and fines in negative ways that will make it more difficult for us to get across the message that organics diversion behavior is the "new normal." Considerably more state- wide public understanding of the issues driving the need for higher levels of organics recycling is needed. Coercive, punitive approaches are not the path to gaining the public cooperation needed to realize the goals set in SB 1383.</p>	<p>Public Resources Code Section 42652.5(a)(1) explicitly contemplates CalRecycle requiring "local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance."</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, "CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code." That section also provides that CalRecycle may "include different levels of requirements for local jurisdictions..."</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, "The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code." SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that "[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. '[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .'. The [administrative agency] is authorized to "fill up the details" of the statutory scheme."</p> <p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations "May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6147	Drane, N., County of Sacramento	<p>see proposed language</p> <p>Definitive language creates untenable situations where Jurisdictions have no enforcement flexibility. Financial penalties are excessive. We suggest, “shall” be changed to “may” and add qualitative language that allows Jurisdictions to focus enforcement efforts on parties insistent on flaunting rules. SB 1383 adopted legislation does not require jurisdictions to adopt ordinances to penalize generators; rather it “authorizes” jurisdictions. Therefore, we suggest changing the “shall” to “may.”</p>	<p>Public Resources Code Section 42652.5(a)(1) explicitly contemplates CalRecycle requiring “local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.”</p> <p>SB 1383 provides a broad grant of regulatory authority to CalRecycle in Public Resources Code Section 42652.5, “CalRecycle, in consultation with the State Air Resources Board, shall adopt regulations to achieve the organic waste reduction goals for 2020 and 2025 established in Section 39730.6 of the Health and Safety Code.” That section also provides that CalRecycle may “include different levels of requirements for local jurisdictions...”</p> <p>Furthermore, CalRecycle also maintains broad, general rulemaking authority in Public Resources Code Section 40502, “The [department] shall adopt rules and regulations, as necessary, to carry out this division [Division 30 of the Public Resources Code] in conformity with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.” SB 1383 is included within Division 30.</p> <p>As stated in <i>PaintCare v. Mortensen</i> (2015) 233 Cal. App. 4th 1292, where CalRecycle successfully prevailed in a court action alleging a lack of authority to pass administrative regulations, the Court stated that “[a]n administrative agency is not limited to the exact provisions of a statute in adopting regulations to enforce its mandate. ‘[The] absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority . . .’ The [administrative agency] is authorized to “fill up the details” of the statutory scheme.”</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Consistent with rules of statutory construction, Public Resources Code Section 42652.5(a)(1) must be read as a whole and interpreted in a way that renders the text as compatible, not contradictory. This section states that the regulations “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance.” The first part of this section explicitly contemplates regulatory requirements on entities besides generators as long as they are relevant to meeting the mandates of SB 1383. Thus, the second part of the section regarding penalties must be read harmoniously and as a whole with the first part to permit penalties on the other entities that may be subject to regulatory requirements. Without enforcement penalties on the other entities, the regulatory requirements are not actually requirements but mere suggestions. Bolstering this interpretation is the Assembly Floor Analysis for SB 1383 (August 31, 2016) which stated that the bill, “May require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and impose penalties for noncompliance.”</p> <p>Regarding the language “authorizing” penalties by local jurisdictions, the clear intent of the legislation was that jurisdictions must penalize non-compliance with SB 1383 requirements. First, the language of Assembly Floor Analysis described above makes this intent clear – CalRecycle may require jurisdictions to impose requirements “and impose penalties for noncompliance.” Second, the Legislature designed the bill to achieve the organic waste reduction goals in part by requiring local jurisdictions to impose requirements. These requirements must be enforceable through penalties or:</p> <p>(a) they will not actually be requirements but suggestions; and (b) there will be no way to ensure compliance by regulated entities and thus achieve the goals of the statute. Given these considerations, CalRecycle has authorized local jurisdictions to impose penalties as long as they meet the conditions described in the regulations regarding categories of violations, requirements to enforce against those violations, and minimum penalty levels.</p> <p>Regarding Section 18995.1(a)(1)(B)(5), CalRecycle notes that the language of this section was amended to simply specify that jurisdictions enforce according the enforcement timetables and compliance extensions in Section 18995.4 and the administrative civil penalty provisions in 18997.2.</p>
6148	Drane, N., County of Sacramento	Delete: Property owner or business owner fails to provide information to employees, contractors, tenants, and customers about organic waste recovery requirements and proper sorting annually, as prescribed by this section. It's too difficult for a jurisdiction to inspect/verify if they provided the information annually or not.	<p>The penalty tables containing the language the commenter is referring to were deleted from the proposed regulations.</p> <p>CalRecycle has revised section 18995.1(a)(1)(A) in response to this comment. Section 18995.1(a)(1)(A) has been revised to state that a jurisdiction shall determine compliance with the organic waste generator requirements set forth in section 18984.9(a). The clarification was added by adding the (a) to exempt jurisdictions from the requirements in subsections (b) through (e) of section 18984.9.</p>
6149	Drane, N., County of Sacramento	re 18997.2 Delete: Organic waste generator, that is a commercial business, fails to provide in all areas where disposal containers are provided for customers. 1st	<p>CalRecycle has revised section 18995.1(a)(1)(A) in response to this comment. Section 18995.1(a)(1)(A) has been revised to state that a jurisdiction shall determine compliance with the organic waste generator requirements set forth in section 18984.9(a). The clarification was added</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>violation = Penalty Level 1 (\$50-\$100/violation). 2nd violation =Penalty Level 1 (\$50-100/violation). 3rd violation =Penalty Level 2 (\$100-\$200/day).</p> <p>It's too difficult, onerous and costly for a jurisdiction to inspect/verify if they provided the containers in all areas where disposal containers are provided for customers. It's also too difficult for a jurisdiction to determine the exact number of days they are in violation of this requirement, so it should be a per violation instead of per day penalty. It's too difficult for a jurisdiction to verify that a generator failed to periodically inspect their own containers and inform employees. Even if they continue to get a contamination penalty, maybe they still did periodically inspect their own containers and inform employees but the employees are still not sorting properly.</p>	<p>by adding the (a) to exempt jurisdictions from the requirements in subsections (b) through (e) of section 18984.9.</p>
6150	Drane, N., County of Sacramento	<p>re 18997.2: Tier One and Tier Two commercial edible food generator fails to arrange to recover edible food and comply with this section...1st violation = Penalty Level 1 (\$50-\$100/violation). 2nd violation =Penalty Level 2 (\$100- \$200/violation). 3rd violation =Penalty Level 3 (\$250-\$500/violation).</p> <p>Modify so there's some allowance for if there is not an organization or service that wants the edible food that they generate.</p> <p>Commercial edible food generator shouldn't be penalized if local food recovery organizations or services don't have the capacity to collect/accept or the need for the edible food that the business generates.</p>	<p>Regarding the comment, “commercial edible food generator shouldn't be penalized if local food recovery organizations or services don't have the capacity to collect/accept or the need for the edible food that the business generates.” CalRecycle has revised Section 18991.3 in response to this comment.</p> <p>Section 18991.3 was revised to specify that a commercial edible food generator shall comply with the requirements of Section 18991.3 unless the commercial edible food generator can demonstrate extraordinary circumstances beyond its control that make such compliance impracticable. One of the extraordinary circumstances specified is a failure by the jurisdiction to increase edible food recovery capacity as required by Section 18992.2, Edible Food Recovery Capacity.</p> <p>Therefore, if a jurisdiction has failed to increase edible food recovery capacity as is required by the edible food recovery capacity planning section of the regulations (Section 18992.2), then commercial edible food generators located in that jurisdiction are not required to comply with the requirements of Section 18991.3 as long as they can demonstrate that the jurisdiction has failed to comply with SB 1383’s edible food recovery capacity planning requirements. However, the regulations also specify that the burden of proof shall be upon the commercial edible food generator to demonstrate extraordinary circumstances.</p> <p>CalRecycle would also like to note that SB 1383 requires jurisdictions to implement edible food recovery programs, which includes the requirement that a jurisdiction shall increase edible food recovery capacity if it is determined that they do not have sufficient capacity to meet their edible food recovery needs. The regulations are structured so that jurisdictions will be required to begin edible food recovery capacity planning in 2022.</p>
6151	Drane, N., County of Sacramento	<p>Reduce fine levels and make them per year instead of per day.</p> <p>If procurement targets are annual, it is not appropriate to calculate the fine on a per-day basis. Example: a city fails to meet its annual procurement goal by 1,000 CY. Is the fee charged per day until the city procures the additional 1,000 CY? Is it retroactive? If the city has to during the next enforcement year, and doesn't meet the target again because of attributing the 1,000 CY to the previous year, is the fine assessed again for the next year? This could lead to a never-ending string of fines.</p> <p>Alternatively, are the fines automatically set to cover a full year, until the city reports for the following year, making the minimum fine \$182,500?</p>	<p>CalRecycle has revised section 18997.3 in response to this comment. The penalty levels have been modified for procurement violations in response to comments.</p>

Comment Number	Received From	Question/Comment	Response(s)
6152	Drane, N., County of Sacramento	<p>re: 20700.5 - delete: (a) Compacted earthen material at least 36 inches shall be placed on all surfaces of the fill where no additional solid waste will be deposited within 30 months to control methane emissions.</p> <p>(1) The EA may approve, with concurrence by the Department, an alternative long-term intermediate cover if the operator demonstrates that the alternative is equivalent to 36 inches of earthen material.</p> <p>The proposed amendment is not necessary for two reasons; the definition of intermediate cover already exists in 27 CCR and the control of landfill methane emissions is already regulated via 17 CCR.</p> <p>CalRecycle has created a new definition “Long Term Intermediate Cover” that is not necessary, as Intermediate Cover is already defined in existing regulation 27 CCR section 20700 as “...all surfaces of the fill where no additional waste will be deposited within 180 days...”. Additionally, methane emission control is already regulated via CCR 17 section 95460 et. seq. The purpose of existing regulation 17 CCR Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 6 is to reduce methane emissions from municipal solid waste (MSW) landfills pursuant to the California Global Warming Solutions Act of 2006 (Health &amp; Safety Code, Sections 38500 et. seq.). Provisions of this regulation establish surface emission testing criteria, methane emission thresholds and regulatory requirements to meet the established thresholds.</p> <p>There has been no scientific or engineering justification for increasing the long-term intermediate cover from the current 12 inches to 36 inches. Methane emissions are already regulated at landfills including monitoring requirements. If the rationale for this increase is to control methane, there has been no indication that the current 12 inches is not sufficient and, in addition, Health and Safety Code 39730.6 states that “the state board shall not adopt, prior to January 1, 2025, requirements to control methane emissions associated with the disposal of organic waste in landfills other than through landfill methane emissions control regulations.” Doubling the amount of cover is a divert funds from program implementation with no added benefit. This provision should revert to the current 12 inches. The imposition of a new definition with additional requirements placed on landfill operators is superfluous and does not benefit the environment or public health. The aforementioned existing regulations are already in place to protect the environment and public health. The proposed amendment increases the threat to the environment and public health by jeopardizing the long-term sustainability of landfill post closure maintenance due to the increased financial burdens associated with compliance of the unnecessary proposed section.</p>	<p>CalRecycle has deleted the Long-Term Intermediate Cover, Section 20700.5 in response to comments. The section was removed and the requirement was included as part of the Status Impact Report (SIR). The SIR was amended to add the requirement to identify areas in the landfill that would remain with intermediate cover. The addition of this requirement to the SIR ensures that areas with intermediate cover are maintained to meet the intermediate cover criteria of controlling the infiltration of precipitation into waste, vectors, fires, odors, blowing litter, and scavenging to reduce threats to public health and safety and the environment.</p>
6153	Drane, N., County of Sacramento	<p>20750.1. CalRecycle– Organic Waste Handling</p> <p>proposed language: For the purposes of the section, “expanding” means a solid waste landfill proposing to <u>significantly expand the permitted landfill refuse footprint or refuse design capacity</u>. (1) Changing the hours of operation of a landfill is not considered an expansion pursuant to 14 CCR Section 51</p>	<p>A change to the regulatory text is not necessary. 27 CCR Section 20750.1(c) defines the term “expanding” to mean a solid waste landfill proposing to make a significant change to the design or operation pursuant to 27 CCR 21665. As noted in Subdivision (c)(1), a significant change does not include a change in hours of operation of a landfill.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>20750.1(c). The proposed amendment effectively requires landfills to construct material recovery facilities (MRF) to recover organic materials, improve an existing MRF, or only accept waste from a high organic diversion waste processing facility if the landfill proposes to “expand”. An expansion is defined as making a significant change to the design or operation of the landfill pursuant to 27 CCR Section 21665. The definition of a “significant change to the design or operation” of a landfill is overly broad and may impose these requirements, and the associated increased costs, on landfills making minor changes that do not expand the design refuse footprint or capacity of the landfill. Existing facilities, which are not expanding their refuse capacity or footprint, may not have land available or the financial resources to construct or expand a MRF.</p>	<p>The purpose of this section is to require new or expanding solid waste landfills to implement an organic waste recovery activity for any waste received that has not been processed previously at a High Diversion Organic Waste Processing Facility or Designated Source Separated Organic Waste Facility. Organic waste recovery activities include (in addition to MRF’s), composting facilities or operations, in-vessel digestion facilities or operations, and other activities listed under Section 18983.1(b). Landfills that do not have available land or the finance to implement an organic waste recovery activity on-site have the option to transport the waste off-site to another facility where a recovery activity can take place.</p>
6154	Drane, N., County of Sacramento	<p>re 21695 (d): remove: The SIR shall be submitted to CalRecycle no later than 180 days from the effective date of this regulation. The disposal reductions created by increased diversion of organics will not have yet occurred, and the required analysis will be based on speculation by the engineer or certified engineering geologist who prepares the report. The current requirement for the JTD to be reviewed on 5-year intervals will be sufficient to allow for changes in a landfill’s operation</p>	<p>CalRecycle has revised Section 21695 in response to comments. The changes to the regulatory text include the requirement that operators identify those areas in the landfill that would remain with intermediate cover and to extend that date for submittal of the Status Impact Report (SIR) from 180 days to one year (365 days) from the effective date of these regulations This standard is not duplicative of a five-year review. The purpose of the SIR is to assist operators better understand the potential impact the proposed regulations could have on their landfill which is different than the five-year review. A five-year review is completed by the EA every five years from the last review and evaluates (among other things) the information provided in the application for the proposed facility to determine whether or not the facility will be able to operate in accordance with state minimum standards and permit terms and conditions.</p> <p>Whereas, the SIR is a site specific, one-time submittal that is prepared by the operator after they have reviewed their landfill operations to determine any potential impacts from the reduction of organic disposal (waste flow) to their landfill. The one-year timeframe established in this regulation for the submittal of the SIR is intended to assist the operator in determining and assessing in the timing of those impacts in order properly implement any changes or modifications to the landfill in a timely manner. Because only the potential impacts associated with the reduction of the amount waste disposed will be reviewed, staff believe that one-year from the effective date of the regulations is an adequate amount of time for the operator to meet the requirements of this section.</p> <p>In addition, this section provides a list of items to be considered by the operator in order to assist them complete the SIR. This information in items listed is needed in order to adequately evaluate the potential impacts to the landfill resulting from the reduction of organic disposal at landfills.</p>
6155	Drane, N., County of Sacramento	<p>re: 17402 -- proposed language: “Consolidation Sites” means facilities or operations that receive solid waste for the purpose of <u>transferring waste to another solid waste operation or facility</u>, or storing the waste prior to transfer directly from one container to another or from one vehicle to another for transport and which do not conduct processing activities.</p>	<p>A change to the regulatory text is not necessary. The definition is necessary to distinguish sites that conduct processing from those that do not. Processing is defined in existing text and not part of this rulemaking process. The intent is not to add a new type of operation or facility but to clarify the type of facilities and operations that are not subject to facilities measurement or record keeping requirements.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>Consolidation activities include, but are not limited to, limited volume transfer operations, sealed container transfer operations, and direct transfer facilities. In our County, we see transfer facilities and processing facilities as two separate types of facilities. Processing facilities sort material to sell or create an end-product that can be sold. Transfer facilities temporarily store, move, and do minimal manual sorting (such as pick obvious containments out of source separated waste streams) prior to transferring the material to other processing or end-use facilities, such as landfills, compost facilities, or recovery facilities for recyclables. Therefore, we believe it is 1383's intent to consider a transfer facility that does not process material, except for the minimal amounts described) a "consolidated site," no matter the quantity handled per day, because the transfer facility would otherwise duplicate all regulatory requirements that is required of processing facilities. However, under the existing definitions of "consolidated sites" and "processing" our transfer station would not be defined a "consolidated site" because they do minimal manual sorting to remove large, obvious contaminants, as previously mentioned. For example, when source separated green waste is delivered, staff will manually pull out obvious non-green waste material, such as a bag of garbage, or a car axel, etc. We are concerned that the existing language for "consolidated sites" and "processing" does not allow for minimal manual removal of contaminants in source separated waste streams. We think CalRecycle would want staff to pull out obvious contaminates, rather than pass it on to the processing facility.</p>	
6156	Drane, N., County of Sacramento	<p>re: 17402 -- proposed language: "Processing" means the controlled separation, recovery, volume reduction, conversion, or recycling of solid waste including, but not limited to, organized, manual, automated, or mechanical sorting, the use of vehicles for spreading of waste for the purpose of recovery, and/or includes the use of conveyor belts, sorting lines or volume reduction equipment. <u>This does not include manual removal of observable contaminants from source separated waste stream prior to transferring.</u> Recycling Center is more specifically defined in section 17402.5 (d) of this Article.</p> <p>In our County, we see transfer facilities and processing facilities as two separate types of facilities. Processing facilities sort material to sell or create an end-product that can be sold. Transfer facilities temporarily store, move, and do minimal manual sorting (such as pick obvious containments out of source separated waste streams) prior to transferring the material to other processing or end-use facilities, such as landfills, compost facilities, or recovery facilities for recyclables. We think CalRecycle would want staff to pull out obvious contaminates, rather than pass it on to the processing facility.</p>	
6157	Drane, N., County of Sacramento	<p>see proposed language.  This section contains several requirements intended to quantify, on a daily basis, the amounts of organic waste at various process stages. The quantification is to be done using characterization sorts of one-cubic yard samples.  We appreciate and agree with the goal of gaining better understanding of residue levels after processing. However, that goal can be achieved with less work and cost than the proposed approach to the science of sampling and analysis.  We ask that CalRecycle rework this section with guidance from an expert who specializes in statistical science as it relates to learning useful information from sampling and analysis. We would expect this would lead to much smaller sample sizes and sampling only when needed to adjust for seasonality</p>	<p>CalRecycle has revised Sections 17409.5.2, 17409.5.3, 17409.5.4, 17409.5.5, 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 in response to comments. The changes to the measurement protocols to determine the amount of organic waste recovered and sent for disposal include a reduction in sample size and frequency. The change is necessary to replace the provision with less burdensome alternative.</p> <p>The methodology described in Sections 17409.5.2 through 17409.5.8, 17867(a)(16)(B), 17896.25.1(a)(1) and 17896.44.1 was revised to require that at least a 200-pound composite sample be a random and representative of a typical operating day for 10 consecutive days per reporting period, instead of daily sampling of one cubic yard.</p> <p>The sampling frequency 10 consecutive days was based on that 2 consecutive weeks per quarter, yielding 10 samples per quarter and 40 samples per year. This is consistent with ASTM calculation method (Standard Test Method for Determination of the Composition of Unprocessed Municipal Solid Waste; ASTM International; Designation: D-5231-92 (Reapproved 2003)) for estimating the number of samples required to achieve a pre-determined precision of specific material type. Using data from the “2014 Disposal-Facility- Based Characterization of Solid Waste in California”, the two most abundant “organics” material types found at landfills and/or curbside pick-up collection systems were “Uncoated Corrugated Cardboard” and “Food”. Furthermore, the 2014 study used a confidence interval of 90% for all data calculations (2014 Disposal Facility- Based Characterization of Solid Waste in California, Page 22). Applying this information to the equation outlined in the ASTM publication, of a 200-pound sample and a precision of 10%, yields a required sample number of 49 for “Uncoated Corrugated Cardboard” and 24 for “food”. Since “Organic Waste Recovery Efficiency” is not specific to a material type such as “Uncoated Corrugated Cardboard” or “Food”, rather just “Organic” or “Not Organic”, it is rational to average the 2 numbers (a sample number of 49 for “Uncoated Corrugated Cardboard” and 24 for “food”) and present a more inclusive required sample number. The average of those two numbers is 37 samples.</p> <p>Additionally, after consulting with divisions within CalRecycle, a significant number of jurisdictions use “Every other week” collection for a portion of their waste stream. Many of these jurisdictions use the same facility or facilities for waste processing. A consecutive two-week sampling standard would ensure that jurisdictions with “Every other week” collections streams are reflected in the sampling. Based on the expert data 10 consecutive days was used instead of 14 to help minimize</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>concerns over frequency of sampling and cost to facilities associated with extra time, labor, space and other logistics required for the analysis and still get the needed data.</p> <p>The 200 pounds is what was used for the Statewide waste characterization studies performed during the past 5 years by California (CalRecycle), Washington, New York, Georgia and Connecticut have used a sample weight between 200 to 300 pounds. Furthermore, ASTM international (American Society for Testing and Material) also suggests a minimum sample weight of 200 pounds be used in waste characterization related studies.</p> <p>In addition, Section 17409.5.9 allows the EA, with concurrence by the Department, to approve alternatives to the measurement protocols described in these sections if the operator can ensure that the measurements will be as accurate.</p>
6158	Drane, N., County of Sacramento	<p>re 17409.5.7 -- remove:</p> <p>1)One load check shall be conducted for every 500 tons of source separated organic waste received per operating day...</p> <p>2) At least one random load check per day for each source sector as defined in Section 18815.2(a)(51)</p> <p>It is the processors advantage to create their own parameters/threshold of contamination allowed with the hauler and jurisdictions to help meet their level of acceptable contamination at their facility, and therefore, Cal Recycle does not need to enforce overly burdensome regulations to keep contamination low.</p> <p>We ask that CalRecycle to remove, or review and rework this section to better balance the amount of work required to generate the information against the value of the information gained from the work.</p> <p>The measurement and load checking comments above also apply to the similar proposed changes to:</p> <p>Title 14, Chapter 3.1, Article 5 (Composting Operation and Facility Siting and Design Standards – pages 79-80)</p> <p>Title 14, Division 7, Chapter 3.2, Article 2, Section 17896.25.1 (Load checking – Contamination in Source Separated Organic Waste – page 82)</p> <p>Title 14, Division 7, Chapter 3.2, Article 3, Section 17896.44.1 (Measuring Organic Waste in Residuals – page 83)</p> <p>Title 27, Division 2, Chapter 3, Subchapter 4, Article 4 (CalRecycle— Controls – page 86)</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
6159	Drane, N., County of Sacramento	<p>Section 17409.5.7</p> <p>proposed language: (3)The operator shall inform the hauler or jurisdiction of origin or jurisdiction’s designee of received loads with visible contamination <u>that have unusually high levels of visible contamination in received loads.</u></p> <p>This requirement would have the facility continually having to inform the haulers or jurisdiction, because even the most well intended generator will have some level of contamination. This requirement should only be triggered if there are unusually high levels of visible contamination in received loads.</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. 			waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
6353	Dutra-Vernaci, C.,City of Union City	Enforcement and Recordkeeping: As currently drafted, the legislation is expected to impose a significant jurisdictional burden on program enforcement and recordkeeping. The amount of staff time that would be required to document all the detailed aspects of the Implementation Record take away from jurisdiction resources that could be used to educate and enforce the generator and hauler requirements. We recommend that CalRecycle reduce the number of reporting requirements and types of information required to what is necessary to determine compliance.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.
6354	Dutra-Vernaci, C.,City of Union City	While we support the need to build urban compost markets throughout the state, it would be more effective to base procurement targets on the potential for compost use in a jurisdiction to build healthy soil, not a statewide estimate of organics generated per capita or current transportation fuel use. Procuring the amount of compost proposed in the regulations would result in more compost than could be used, and put an undue financial burden on cities. The City of Union City requests that the procurement regulations be addressed in a separate regulatory proceeding.	<p>The purpose for the procurement target methodology is to create a transparent method for local governments to create markets for products generated by organics recycling facilities that is proportional to the number of residents in a jurisdiction. California has over 400 diverse jurisdictions it is impractical, unnecessary, and it would be overly burdensome to account for each jurisdiction's soil organic matter content and to develop a procurement target and enforcement policy for each one. Furthermore, by only accounting for soil organic matter, the procurement target would eliminate options for jurisdictions to procure other recovered organic waste products, such as renewable transportation fuel. CalRecycle disagrees with a blanket requirement for all jurisdictions to use a certain amount of each type of material. For example, a jurisdiction may not have a use for compost. By requiring blanket usages for each product, jurisdictions may be forced into procuring products that may be incompatible with their local needs. The regulations as written allow jurisdictions the flexibility to procure products that fit their local needs.</p> <p>Regarding the proposal for a second regulatory proceeding, CalRecycle disagrees with the suggestion to phase-in procurement or to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved. However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022.</p>
9000	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	Article 2 Section 18983.1(b)(6)(B)(1) — This section delineates activities that are deemed to be "recovery" and thus a reduction in landfill disposal. This section includes biosolids land application and references Appendix B of the federal part 503 regulations, which stipulate technology and other standards for both Class B and Class A pathogen reduction necessary for land application. The language in this section of the draft regulatory text, however, specifies only anaerobic digestion and compost as recovery activities. Appendix B provides detail on a suite of Class B and	CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO <sub>2</sub> e per short ton organic waste processed. Therefore, section 18983.1(b)(6)(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383.

Comment Number	Received From	Question/Comment	Response(s)
		<p>Class A pathogen reduction technologies, including far more options for achieving each Class, all of which are deemed equivalent to anaerobic digestion or composting under the part 503 regulations and should be deemed equivalent as "recovery" and reduction in landfill disposal. Greenhouse gas reduction achieved via land application rather than landfilling is the same regardless of the technology employed to meet the pathogen reduction and vector attraction reduction criteria. The methane reduction is realized in the avoidance of landfilling not by the process utilized to treat the biosolids. While it is true that most biosolids in California undergo either anaerobic digestion and/or composting, other compliant technologies are also utilized and entities should not be penalized for using them. CASA strongly urges CalRecycle to replace the words ". . . anaerobic digestion or composting. . ." With "...one of the processes..." In support of this argument, please refer to the BEAM model at this link: <a href="https://casaweb.org/wp-content/uploads/2015/12/1BrownetalEST-GHGCalculator10.pdf">https://casaweb.org/wp-content/uploads/2015/12/1BrownetalEST-GHGCalculator10.pdf</a> which has been adopted by the Canadian Ministries of the Environment as a means to quantify the climate change mitigation benefits of biosolids land application.</p>	<p>However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste. Please refer to Section 18983.2 for more information.</p>
9001	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	<p>Article 2 Section 18983.1 (c) — This definition of landfill includes ". . .export out of California for disposal, or any other disposal of waste as defined by Section 40192(c) of the Public Resources Code." This is a very broad definition that could be construed to limit the safe application of biosolids to land, within or beyond state boundaries. We believe this is an overly restrictive definition that may create confusion because of the inclusion of technologies other than landfilling in the definition of landfill (by virtue of the cross-reference to Public Resources Code Section 40192(c)). We request that CalRecycle clarify the scope of this definition. (See comment three below as well.)</p>	<p>It is unclear from the comment what "technologies" the commenter is referring to or what clarity they are seeking as to the scope of this section. To the extent the comment is addressing land application of compostable material, that activity is specifically identified as a reduction in landfill disposal if it meets the conditions of the section. To the extent the comment is addressing surface disposal sites at wastewater treatment plants, that would be considered landfill disposal under this section unless it meets the requirements of land application of biosolids under this section or qualifies as an alternative technology that constitutes a reduction in landfill disposal under Section 18983.2.</p>
9002	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	<p>Article 6 Section 18987.2(a)(1)- The language requires all biosolids produced at any wastewater treatment plant to be treated via anaerobic digestion and/or composting and sent for land application. In addition to other treatment technologies as mentioned in comment one above, there are also other end uses employed which would be disallowed under this requirement. Similarly, it is imperative that all treatment options in 40 CFR part 503 Appendix B (Class A and Class B) be allowed and viewed as "recovery," not just anaerobic digestion and composting. We recommend all treatment technologies specified in Appendix B of 40 CFR part 503 which result in land application or land reclamation should be counted as a reduction in landfill disposal. Existing biosolids management practices whereby biosolids do not leave the site should be excluded from these regulations, and emerging technologies that may result in fuel or energy production, and do not send any biosolids to a landfill, should be encouraged.</p>	<p>Comment noted. Section 18987.2 was removed from the regulations. The regulations do not ban any organic waste stream from landfills. This is prohibited in statute and it is therefore unnecessary to explicitly articulate this.</p>
9003	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	<p>Article 9 Section 18990.1 ( c)(3) seems inconsistent with the language added to Section 18990.1(a and b) which restricts local ordinances such that they may not impede organics recycling. Sub (c )(3) seems to supercede that restriction. Clarity or</p>	<p>A. The requested changes to the regulatory text are not necessary. However, CalRecycle is adding additional language to Section 18990.1(b)(1) to further clarify its meaning in light of comments received regarding it. Article 9, Sections 18990.1 (a) and (b) are not contradictory. 18990.1 (a) clarifies that it does not limit a jurisdiction in adopting more stringent standards than</p>

Comment Number	Received From	Question/Comment	Response(s)
		revision of this language is requested to ensure an open market across California for organics recycling.	<p>the ones outlined in this chapter. The purpose of the specific limitations set forth in paragraphs 1-5 of 18990.1 (b) are to ensure that jurisdictions do not impose restrictions on the movement and handling of waste and waste-derived recyclables that would interfere with or prevent meeting the organic waste recovery targets established in SB 1383.</p> <p>B. Article 2, Section 18983.1 (b)(6)(b) clarifies that land application of biosolids constitutes a reduction in landfill disposal provided that the application complies with minimum standards. This section specifies that to be considered a reduction in landfill disposal for the purposes of this regulation, land application of biosolids must comply with existing regulatory requirements and have undergone composting or anaerobic digestion. While this regulation defines land application as recovery, this regulation does not allow land application of biosolids be done in a manner that conflicts with existing public health and safety regulations and requirements. Land application of composted or digested biosolids prevents the landfill disposal of this material and reduces greenhouse gas emissions. This supports the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions and is therefore considered a recovery activity for the purposes of this regulation. The additional language will ensure that such restrictions can be reviewed on a case-by-case basis to determine if they are actually necessary and tailored to protect the public health and safety, or if they are actually unnecessary and overbroad restrictions.</p>
9004	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	Sub (f)(1) stipulates that compost is an eligible product. We assume this includes biosolids compost but request explicit confirmation of that. Furthermore, there are many other biosolids products which should be considered as eligible recovered organic waste products. A jurisdiction should be given broad latitude in meeting this requirement, and all biosolids products meeting the land application requirements of 40 CFR part 503 should be eligible.	The current draft regulatory text considers compost an eligible recovered organic waste product as long as the final product meets the definition of compost, per Section 17896.2(a)(4), and is produced either at a compost operation or facility or large volume in-vessel digestion facility that composts on-site (refer to Section 18993.1(f)(1)(A) and (B)). Biosolids and/or digestate that do not meet the compost definition will not count towards the procurement target. However, CalRecycle disagrees with adding "other biosolids products". The broad range of potential products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors.
9005	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	Sub (f)(2) stipulates that renewable transportation fuel is also an eligible recovered organic waste product. While we support the intent of this requirement to help create end markets, we question the definition of Renewable Transportation Fuel in Article 1 18982(a)(62), which requires the fuel be derived ". . . from organic waste diverted from a landfill and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste." Does this exclude renewable transportation fuel which is derived from sewage sludge anaerobic digestion alone, without co-digestion? We trust that is not the intent, since anaerobically digesting sewage sludge, land applying the resultant biosolids, and producing low carbon transportation fuel is certainly consistent with the requirements of SB 1383 and these regulations. All sewage sludge which is anaerobically digested could be considered to be diverted from landfills. Please clarify whether the intent of the language is to include all sewage sludge and co-	CalRecycle disagrees with the commenter's argument to allow renewable gas derived solely from sewage sludge to be eligible for procurement. The regulations clarify that only renewable gas derived from organic waste received at a POTW from solid waste facilities may count towards a jurisdiction's procurement target. Other materials digested at a POTW, such as sewage sludge, are ineligible. Renewable gas derived solely from sewage sludge is ineligible for procurement because a POTW is not a solid waste facility and therefore not in the scope of the legislative intent of SB 1383. Sewage sludge is also not typically destined for a landfill, so its use does not help achieve SB 1383's landfill diversion goals. For the reasons noted above, gas generated from the inflows of a sewer system and not from organic waste diverted from the solid waste stream cannot logically be considered a recovered organic waste product. It is inconsistent with the requirements of SB 1383 to incentivize or mandate activities that do not contribute to landfill diversion of organic waste.

Comment Number	Received From	Question/Comment	Response(s)
		<p>digested materials under this eligibility requirement. Alternatively, we respectfully request this definition be amended to read: ". . . gas derived from organic waste processed in an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 or Title 23."</p>	<p>However, POTWs that accept food waste can technically do so without a solid waste facility permit, they are explicitly authorized to do so per Title 14, making it functionally similar to incentivizing biomethane from a solid waste facility. Therefore it is justifiable to allow the portion of renewable gas resulting from the digestion of food waste that is recovered at POTWs that accept food waste from a facility or operation identified in Section 18993.1(h)(1)(A)-(C) to count toward the procurement targets.</p>
9006	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	<p>Sub (f)(2) — We also request that any other beneficial uses of methane be deemed eligible to qualify as fulfilling the procurement obligations. This includes pipeline injection for sale as a non-transportation fuel, on-site power production and exported electricity, as well as the production of renewable transportation fuel. All should be deemed to be recovered organic waste products and eligible to satisfy the procurement requirements.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle has revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. Note that pipeline injection is not an eligible procurement option in order to eliminate the potential for double-counting the same gas for different procurement targets. For example, by including pipeline injection, a jurisdiction(s) could count pipeline injected gas as well as the end use of that gas. The draft regulations do not preclude renewable gas facilities from injecting gas into the pipeline, but the language has been streamlined to clarify that only the end use of that gas (transportation fuel, electricity, heating applications) will be counted towards a jurisdiction's procurement target.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>

Comment Number	Received From	Question/Comment	Response(s)
9007	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	CalRecycle should include procurement of bioenergy and compost from diverted organic waste by the State of California. We recommend the proposed regulations be broadened to include procurement by the State in addition to local governments. This will help to achieve the requirements of SB 1383 in the most expeditious and cost effective manner.	<p>Regarding state agencies. State agency procurement is within the purview of the Legislature through the annual budgeting process, the Governor’s office through Executive Orders, the Department of General Services through the establishment of the State Administrative Manual (SAM), and other control agencies that oversee budgeting and procurement. CalRecycle cannot supersede those existing authorities and impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>There are existing procurement requirements on state agencies and this rulemaking will not be adding to those. CalRecycle currently works with sister agencies to implement existing procurement-related legislation. For example, CalRecycle coordinates with the Department of General Services (DGS) to implement the State Agency Buy Recycled Campaign (SABRC), Public Contract Code 12200 to 12217, which requires state agencies to purchase products, including compost and paper, containing recycled content. Additionally, AB 2411 (McCarty, Statutes of 2018), requires CalRecycle to develop a plan for compost use in wildfire debris removal efforts, and to coordinate with the Department of Transportation to identify best practices for compost use along roadways. CalRecycle also worked with sister agencies through the AB 1045 process, which directed CalEPA, CalRecycle, the Water Board, ARB, and CDFA to “develop and implement policies to aid in diverting organic waste from landfills by promoting the composting of specified organic waste and by promoting the appropriate use of that compost throughout the state.” These are examples of how CalRecycle works with sister agencies, but CalRecycle cannot impose procurement mandates on other state agencies without the necessary statutory authority, which SB 1383 lacks.</p> <p>Regarding “nonlocal entities”, it is important to clarify that the populations in, for example, local education agencies and special districts are already included in a jurisdiction’s population-based procurement target; the population data published by the Department of Finance (DOF) includes universities, community colleges, and other local education agencies. The populations inherent in these entities are built into the procurement target calculation, and jurisdictions are encouraged to work with these entities to meet their procurement targets, which may be accomplished through a contract or agreement, such as a Memorandum of Understanding (MOU). Applying procurement targets to these entities, especially population-based procurement targets, would result in double counting individuals contributing to the procurement requirements.</p>
9008	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	The proposed regulations should explicitly authorize diverted organic waste projects that were constructed prior to the adoption of the regulations. To avoid ambiguity, the proposed regulations should explicitly grandfather eligible bioenergy and compost projects constructed prior to adoption of the regulations. The proposed regulations do not explicitly do so now and it is important to ensure that early adopters of organic waste diversion projects are not penalized.	Grandfathering pre-existing operations as technologies that constitute diversion from landfill disposal may not ensure methane reduction.
9009	EBMUD (Chakrabarti, A., East Bay Municipal Utility District)	2014 Waste Characterization Study- Please confirm that this study has been updated to include biosolids data from 2014, since this serves as the baseline upon which compliance with the draft regulations is based.	The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the

Comment Number	Received From	Question/Comment	Response(s)
			<p>most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle's use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study.</p> <p>However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.</p>
3151	Edminster, D.	1. Section 42652.5(a)(3) states that there is no numeric waste disposal limit for individual landfills. So, my question is whether landfills may continue to accept self-haul deliveries of organic waste from individual property owners and businesses, such as landscape services?	Yes. Nothing in the regulations prohibits this from occurring.
3152	Edminster, D.	2. Does SB 1383 apply to non-MSW, namely organic agricultural waste, and may landfills continue to accept this waste for disposal?	The regulations define organic waste by material type. The regulations do not define organic waste by source sector. Jurisdictions are required to provide organic waste collection services to generators subject to their authority, however as noted in the regulations, nothing prevents generators from managing their own organic waste on site (e.g. on-farm composting). Additionally jurisdictions may waive generators from collection requirements if they generate de-minimis amounts of organic waste for collection.
3153	Edminster, D.	3. If I understand correctly, SB 1383 uses tons of disposal in the year 2014 as the baseline, with a mandate to reduce that figure by 75% by the year 2025. Thus, if a jurisdiction disposed 100,000 tons of organics in 2014, it would need to divert 75,000 tons and reduce disposal to 25,000 tons by the year 2025. Do I have that right? Also, can these tonnage figures be adjusted to account for population growth and economic expansion since 2014?	Comment noted. The comment relates to the statutory language in SB 1383 rather than the regulatory text or the regulatory process.
11	Edwards, D, Air Liquide Hydrogen Energy	We are requesting that regulations continue to support all options for renewable hydrogen supply by continuing to enable landfill gas as a transportation fuel feedstock across CalRecycle programs. In the attachment to this document, we have further information to support this position.	The SB 1383 mandate is to recover organic waste that would be disposed. Generating gas in municipal solid waste landfills requires disposal of organic waste in landfills; therefore it is inconsistent with statute to incentivize or mandate activities that do not reduce landfill disposal.
12	Edwards, D, Air Liquide Hydrogen Energy	The proposed SLCP Regulations are clearly an outcome of substantial efforts made by the staff to address concerns and comments raised in previous workshops. We applaud the staff's efforts and creativity in seeking long-term solutions and in their consideration of industry inputs over the life of this program. As originally conceived, the Legislature specifically directed CalRecycle to comply with a number of conditions in developing the regulatory requirements. including: Support cost-effective, and environmentally beneficial uses of biomethane derived from solid waste facilities and it is noted that The SLCP Strategy states that transportation fuel represents the highest value use of biomethane.	Thank you for your comment. CalRecycle agrees that procurement will be an important part of meeting SB 1383's organic waste diversion goals.

Comment Number	Received From	Question/Comment	Response(s)
13	Edwards, D, Air Liquide Hydrogen Energy	We ask the CalRecycle to continue to consider all reduced carbon pathways to meet the renewable requirements in it's programs and not to invoke limitations on landfill gas as an eligible feedstock in hydrogen production for transportation fuels.	The SB 1383 mandate is to recover organic waste that would be disposed. Generating gas in municipal solid waste landfills requires disposal of organic waste in landfills; therefore it is inconsistent with statute to incentivize or mandate activities that do not reduce landfill disposal.
6246	Eggemeyer, J., County of San Mateo	Please provide examples of "food service distributors" as you have for "food recovery organization," "large event," "large venue," and others.	<p>In a previous draft of the regulations, food service providers and food distributors were included under one definition. The term used to identify these entities was "food service distributor." Due to this definition lacking clarity, a commenter asked CalRecycle to provide examples of "food service distributor." Another commenter recommended that the term "food service distributor" be removed from the regulations and that separate definitions for "food distributor" and "food service provider" be used instead.</p> <p>CalRecycle revised the regulatory text in response to these comments. Recognizing that food distributors and food service providers have different functions in the food supply chain and often perform very different roles, the term "food service distributor" was removed and replaced with two separate definitions; one definition for "food distributor," and a separate definition for "food service provider." The final definitions are below:</p> <p>"Food distributor means a company that distributes food to entities including, but not limited to, supermarkets and grocery stores."</p> <p>"Food service provider means an entity primarily engaged in providing food services to institutional, governmental, commercial, or industrial locations of others based on contractual arrangements with these types of organizations."</p> <p>Please note that specific names of companies that meet these definitions were not included in the regulations.</p>
6247	Eggemeyer, J., County of San Mateo	Please provide guidance on how to determine if a grocery store is 7,500 sf or larger as well as how to determine if a restaurant exceeds 5,000 sf. Clarification is needed as to whether this is gross or net square footage (e.g. does it include storage areas, restrooms, etc.).	<p>CalRecycle revised the threshold for grocery stores from 7,500 square feet to 10,000 square feet. This change was made in an effort to have the threshold align with environmental health inspections of grocery stores, so that these commercial edible food generators can be more easily identified by the jurisdiction through their local environmental health department's food facility permit records. The same methodology could be used to help identify restaurants that meet the 250 or more seats or total facility size equal to or greater than 5,000 square feet threshold.</p> <p>In regard to the commenter's question about gross or net square footage, the precise language used in the regulations is a "grocery store with a total facility size equal to or greater than 10,000 square feet. This includes storage areas and restrooms. The same is true for restaurants. Restaurants with 250 or more seats or a total facility size equal to or greater than 5,000 square feet are required to comply with the commercial edible food generator requirements.</p>
6248	Eggemeyer, J., County of San Mateo	Please provide clarity on the definition of "food" in the context of SB 1383. For example, chocolate, candy, alcoholic beverages, and chewing gum are considered edible food per the Health and Safety Code but are not substances food banks and other food recovery organizations wish to redistribute in their programs	<p>SB 1383's statute requires CalRecycle to adopt regulations that include requirements intended to meet the goal that not less than 20 percent of edible food that is currently disposed is recovered for human consumption by 2025. The statute does not state that 20% of healthy or nutritious food must be recovered. As a result, SB 1383's regulations do not include requirements that only certain types of food be recovered. Commercial edible food generators must arrange to recover the maximum amount of edible food that would otherwise be disposed. If a food recovery organization or service does not want certain foods because the food does not meet the organization's nutrition standards, then the food recovery organizations does not have to accept the food. Please note that there is nothing in SB 1383's regulations that prohibits a food recovery</p>

Comment Number	Received From	Question/Comment	Response(s)
			organization or service from refusing to accept edible food from a commercial edible food generator.
6249	Eggemeyer, J., County of San Mateo	Section 18984.1. Three-Container Organic Waste Collection Services: Please refine the definition of "non-compostable paper"-does it include drink containers, paper plates and cups, or is it primarily for aseptic packaging (e.g. Tetrapak). A clearer definition could be: Plastic-coated paper is a coated or laminated composite material made of paper or paperboard with a plastic layer or treatment on the surface or within the layers.	The definition includes paper covered in any plastic material that won't break down in the composting process. Wax coatings on paper drink containers, for example, are compostable.
6250	Eggemeyer, J., County of San Mateo	Section 18984.1. Three-Container Organic Waste Collection Services: Please clarify how bioplastics fit into the new recycling and composting processes and provide a definition for bioplastics as not all bioplastics are biodegradable.	CalRecycle generally supports processes that could help increase participation and capture rates, but SB 1383 provides that the intent of these regulations is to reduce the disposal of organic waste that generate methane in landfills. Bioplastics are generally not considered an organic waste and therefore is outside the purview of these regulations. In addition, bioplastics are designed to degrade in an aerobic composting environment but these regulations are not limited to just composting.
6251	Eggemeyer, J., County of San Mateo	Section 18984.5 Container Contamination Minimization - Due to the added cost for conducting route reviews, the County requests that the timeframe for conducting route reviews of all routes be extended from quarterly to once or twice a year.	Thank you for the comment. CalRecycle modified the regulations to be annual. For clarity, the regulations allow the jurisdictions to determine random selection, which is the least costly and burdensome approach compared to requiring statistically significant sampling.
6252	Eggemeyer, J., County of San Mateo	Section 18984. 7 Container Color Requirements The County requests that the responsibility for providing carts lie with the hauler instead of the jurisdiction.	Article 1, Section 18981.2 allows for jurisdictions to designate responsibility for providing containers to its hauler.
6253	Eggemeyer, J., County of San Mateo	Section 18984.8 Container Labeling Requirements The County supports grandfathering existing carts in the proposed labeling requirements. Alternatively, the County also supports switching to a phase-in approach to only include carts that are broken or have deteriorated. Currently, labels do not stick to carts in the SBWMA service area; instead, the carts have embedded labels. Relabeling the carts would require replacing them all resulting in significant additional costs.	The regulations provide that a jurisdiction is not required to replace functional containers, including containers purchased prior to January 1, 2022, that do not comply with the color requirements of this article prior to the end of the useful life of those containers, or prior to January 1, 2036, whichever comes first. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container. This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that

Comment Number	Received From	Question/Comment	Response(s)
			<p>these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers' useful life or by 2036.</p> <p>A jurisdiction's designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>A change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p> <p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>The current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier time.</p>
6254	Eggemeyer, J., County of San Mateo	Section 18986.1 Non-Local Entities Requirements The County requests that vegetarian pet waste be allowed to be collected in a green container (e.g. waste from rabbits, hamsters, etc.)	<p>If the Local Enforcement Agency determines that a material type cannot be safely recycled, then a jurisdiction would be allowed to list that material as not acceptable. Additionally, during the informal workshops many other stakeholders stated that they have programs for these material types. Further human and pet waste are not required to be measured as organic waste for the purpose of measuring contamination in 18984.5. With respect to human and pet waste, a jurisdiction may prohibit human waste in the green or blue container in a 3-container system and in the green container in a 2-container system. This change is necessary in order to support jurisdiction efforts to minimize public health impacts.</p> <p>This revision does not apply to pet waste, as many jurisdictions collect manure and take this material to processing facilities that have to meet pathogen reduction requirements.</p>
6255	Eggemeyer, J., County of San Mateo	Section 18986.1 Non-Local Entities Requirements - There is an inconsistency between the requirements for non-local entities and other entities. For example, the prohibition on pet waste in green containers is only specified for non-local entities.	Thank you for the comment. CalRecycle amended the applicable sections for consistency.

Comment Number	Received From	Question/Comment	Response(s)
6256	Eggemeyer, J., County of San Mateo	The County does not have a franchise in rural areas due to the limited customers in these areas nor does it qualify as rural exempt due to the overall population numbers. Additionally, there are three areas that are considered special districts in which the County does not receive franchise fees nor manage the garbage franchise agreements for, and two more areas that are part of a city franchise agreement. There are only two unincorporated areas that the County manages the franchise for	A change to the regulatory text is not necessary. It is possible that the areas referenced here would fall in low population waivers. Pursuant to 18988.1, a County will have to initiate some type of authorization to collect organic waste in rural areas that do not have a franchise.
6257	Eggemeyer, J., County of San Mateo	The County cannot increase the franchise fee for the entire unincorporated area as this would be a Proposition 218 violation. How is the County expected to assess a fee for these programs or demonstrate other means of financially supporting the expansion of organic recycling for all of the unincorporated areas? Proposition 218 restricts property-related fees, defined as fees imposed "as an incident of property ownership." Is it possible for the County to charge a fee on all organic tons processed within the service area? This would be similar to the AB939 fee imposed at the landfills for all tons disposed. If so, please add this language to the regulations.	<p>CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.</p> <p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, "No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code." Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a "tax" under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe "any fees" that may in the future be imposed by the numerous local jurisdictions in California as "likely" to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
6258	Eggemeyer, J., County of San Mateo	Regarding "other funding mechanisms," please provide additional clarity as to what other mechanisms could be.	A change to the regulatory text is not necessary. A change is not necessary because the regulations do not specify how the jurisdiction must fund its program. A jurisdiction might fund programs through a variety of means, including grants, partnerships, franchise fees, local assessments, etc.

Comment Number	Received From	Question/Comment	Response(s)
6259	Eggemeyer, J., County of San Mateo	Although there is language around funding for the edible food recovery program and organic waste recycling capacity planning, we did not find any language in the regulations allowing for funding mechanisms related to reporting and enforcement. Is the expectation that the Local Enforcement Agencies will be required to conduct these tasks under AB 939?	Local Enforcement Agencies are not expected to oversee Chapter 12 of the regulations. It is beyond their statutory authority and duties.
6260	Eggemeyer, J., County of San Mateo	The County finds that the requirement that generators contract with recovery organizations the most important and innovative aspect of the Edible Food Recovery Program legislation. We encourage CalRecycle to continue to keep this requirement as the program will be impossible to implement without such a requirement.	A change to the regulatory text was not necessary because this comment is in support of SB 1383's commercial edible food generator requirements.
6261	Eggemeyer, J., County of San Mateo	Please provide guidance on how to tell if an edible food generator has "intentionally" allowed food to spoil and thereby preventing it from being recovered.	To clarify, an example of intentionally spoiling edible food would be if a commercial edible food generator placed edible food that could be recovered for human consumption into a dumpster and then poured bleach or some other substance over the edible food to render it inedible. There are examples of businesses practicing this kind of activity to prevent individuals from taking food from dumpsters and consuming it. Since some commercial edible food generators do intentionally spoil edible food that could be recovered for human consumption, CalRecycle added language to Section 18991.3(e) stating that a commercial edible food generator shall not intentionally spoil edible food that is capable of being recovered by a food recovery organization or service.
6262	Eggemeyer, J., County of San Mateo	Due to lack of resources for inspection and enforcement, the County requests extending the timeframe for issuing notices of violation from 60 days to 90 days to allow for more flexibility.	A change to the regulatory text is not necessary. Section 18995.4 explains the minimum timeframe for the process of issuing a Notice of Violation to an entity if there are found non-compliant. A jurisdiction has 60 days from the date of inspection to issue a NOV. This allows time for the entity to remedy the situation before the jurisdiction issues a NOV. Extending this time frame would allow the entity to be non-compliant an additional 30 days. Once the jurisdiction issues a NOV, it must follow up within 90 days. This subsection conforms to the Departments general procedure of written notices of potential failure and a reasonable timeframe for remedy.
6263	Eggemeyer, J., County of San Mateo	Please clarify whether or not administrative citations would qualify as a Notice of Violation. If not, the County requests that the language in the regulations be changed to reflect this distinction as the County issues administrative citations and the time frame for compliance is different than proposed in the regulations.	A change to the regulatory text is not necessary. The Chapter allows a jurisdiction the flexibility to fulfill its oversight role by adopting their own enforceable ordinances and enforcement timeframes. A jurisdiction has the discretion to name the process of issuing a Notice of Violation anything it finds appropriate but the process must adhere to the standards and procedure and also be equivalent or more stringent as the process outlined in the regulations.
6264	Eggemeyer, J., County of San Mateo	To ensure that the legislation is implemented effectively and consistently, the County requests that CalRecycle provide cities and counties with the following tools and resources: o A sample ordinance cities and counties can adopt o A system for sampling route reviews o Clear instructions for how to fulfill recordkeeping requirements o A method for calculating a jurisdiction's edible food recovery capacity o Funding	Comment noted. This comment is not specific to any aspect of the regulatory text. CalRecycle intends to provide guidance to jurisdictions throughout 2020 and 2021 prior to the implementation date of the regulatory requirements. CalRecycle will additionally continue to provide regulatory guidance as the regulations take effect.
6265	Eggemeyer, J., County of San Mateo	The requirements for enforcement, outreach, and reporting will place a significant financial and staffing burden on local jurisdictions.	Comment noted. CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to

Comment Number	Received From	Question/Comment	Response(s)
			impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
6266	Eggemeyer, J., County of San Mateo	Please clarify the language for special districts (e.g. a sanitary district, LAFCO) located in unincorporated county areas which manage these types of franchises with a waste hauler. Who is responsible for complying with these regulations? If the County is responsible, language is needed for these types of districts to report and comply with the jurisdictions doing the reporting and enforcement.	In response to this comment, CalRecycle defined a “special district” as having the same meaning as Section 41821.2 of the Public Resources Code. Special districts can be jurisdictions or non-local entities depending on the nature of the district and its activities. There are special districts that oversee waste collection services. Accordingly, the definition of jurisdiction was amended to note that a “special district that provides solid waste collection services” is a jurisdiction. Additionally, a special district could be a non-local entity. Non-local entities are specifically defined as entities that are organic waste generators but are not subject to the control of a jurisdiction’s regulations related to solid waste. The definition of “non-local entity,” lists special districts as an example of a type of entity that could be a “non-local entity” but it does not definitively state that all special districts are non-local entities. Any special district that is a “jurisdiction” and also a “non-local entity” generator would be subject to enforcement by the Department for violations of generator requirements in Chapter 12 unless requirements are waived under Section 18986.3. CalRecycle revised the definition of ‘jurisdiction’ in Section 18982(a)(36) because the original term “handling” as used in the definition is overly broad. This change is necessary to provide clarity.
3316	Elliott-McCrea, W., Second Harvest Food Bank Santa Cruz County	<p>Financial and nutrition considerations</p> <ul style="list-style-type: none"> <li>• The State, local jurisdictions and food banks will only be able to achieve this goal with appropriate investment in capacity building and physical infrastructure to increase the volume of food can receive, store and distribute.</li> <li>• In addition, jurisdictions must be able to fund these food recovery activities through avenues such as franchise fees and local assessments.</li> <li>• It is important that we have an extremely limited budget. We must be diligent in creating ongoing partnership that do not risk our ability to sustain food bank services. Food Banks need to be able to refuse food donations.</li> <li>• Please note that our core mission is to increase access and consumption of nutritious food for families, children, seniors and others, so that they can have healthier lives.</li> <li>• Unhealthy diets and related chronic disease leads are one of the largest barriers to children growing up healthy and successful. We divert as much unhealthy food that we recover as possible for animal feed and work with a number of ranchers directly. We look forward to the City of Watsonville to enhance its composting capacity so that our increased recovery efforts do not result in larger garbage bills for the food not fit for animal food. We cannot afford these extra costs and they would curtail our ability to be more aggressive in our food recovery work.</li> <li>• What I am saying is that fundamental to this work is recognition that our participation is voluntary in regard to which edible food waste generators meet our standards for edibility and healthy nutrition.</li> </ul>	A change to the regulatory text was not necessary because the commenter did not make recommendations to revise the text. CalRecycle recognizes that there is a lack of sustainable funding for food rescue infrastructure and capacity in California. To address this, CalRecycle included language in Article 10, Section 18991.1 stating that a jurisdiction may fund the actions taken to comply with the jurisdiction edible food recovery program requirements through franchise fees, local assessments, or other funding mechanisms. This language was included in the section to encourage jurisdictions to establish a sustainable funding source to help fund their local food recovery programs. CalRecycle would also like to mention that CalRecycle has a food waste prevention and rescue grant program that funds food waste prevention and food rescue projects in California. To date, CalRecycle has awarded 20 million dollars to over 60 grantees. CalRecycle also recognizes that a core value of many food recovery organizations and services is to reduce food insecurity in their communities by rescuing and distributing healthy and nutritious food to help feed people in need, and that some organizations have nutrition standards for the food they are willing to accept. To help address this, the final regulations include a provision in Section 18990.2 that states, “Nothing in this chapter prohibits a food recovery service or organization from refusing to accept edible food from a commercial edible generator.” As a result, food recovery organizations and food recovery services are not mandated to accept food. In addition, the final regulations require commercial edible food generators to establish contracts or written agreements with food recovery organizations or services. However, there is no requirement in SB 1383’s regulations mandating food recovery organizations and food recovery services to enter into contracts or written agreements with commercial edible food generators. Food recovery organizations and food recovery services can choose not to participate. If a

Comment Number	Received From	Question/Comment	Response(s)
			commercial edible food generator approaches a food recovery organization or a food recovery service requesting a contract or written agreement, it is at the discretion of the food recovery organization or the food recovery service to determine if they want to enter into such contract or agreement. It is also at the discretion of food recovery organizations, food recovery services, and commercial edible food generators to determine the specific language that will be included in their contracts or written agreements for food recovery.
3317	Elliott-McCrea, W., Second Harvest Food Bank Santa Cruz County	Funding mechanisms recognize that 1. A large share of the costs associated with increasing the capacity for food rescue will be for labor and physical infrastructure costs associated with coordinating the additional food, 2. Recovery activities pursuant to SB 1383's goal will nearly always augment work already being done with a mixture of existing and new capacity (staff, cold storage, vehicles, fuel and other fixed costs), and therefore funding should not be restricted to incremental pounds of food.	CalRecycle recognizes that there is a lack of sustainable funding for food recovery infrastructure and capacity in California. To address this, CalRecycle included language in Article 10, Section 18991.1 stating that a jurisdiction may fund the actions taken to comply with the jurisdiction edible food recovery program requirements through franchise fees, local assessments, or other funding mechanisms. This language was included in the section to encourage jurisdictions to establish a sustainable funding source to help cover their program implementation costs. If a jurisdiction decides to fund their edible food recovery program through franchise fees, local assessments, or other funding mechanisms, then it is at the discretion of the jurisdiction, not CalRecycle, to determine how the funding will be dispersed. CalRecycle would also like to clarify that nothing in SB 1383's regulations prohibits a food recovery organization or a food recovery service from including cost-sharing language in their contracts or written agreements with commercial edible food generators. For further clarification please refer to the FSOR.
3318	Elliott-McCrea, W., Second Harvest Food Bank Santa Cruz County	It is imperative that CalRecycle and local jurisdictions exempt the 'nonprofit charitable organizations' (food banks and their non-profit partners) from fees and penalties related to their own waste incurred during compliance with SB 1383 as long as they are accepting donations with the intention to distribute the food for consumption. As the stream of donations increases, there may be more instances where food is not handled safely or as represented and if the non-profit charitable organizations are to help get this food out, it is important that they not be penalized for attempting to solve the overall problem.	Nothing in SB 1383's regulations requires a food recovery organization or a food recovery service to accept edible food. Section 18990.2 of the regulations states, "(d) Nothing in this chapter prohibits a food recovery service or organization from refusing to accept edible food from a commercial edible food generator." If a food recovery organization or service cannot safely collect and distribute food because it is at maximum capacity, then it should not be collecting any more food. In addition, nothing in SB 1383's regulations requires food recovery organizations and food recovery services to enter into contracts or written agreements with commercial edible food generators. Food recovery organizations and food recovery services can choose not to participate. If a commercial edible food generator approaches a food recovery organization or a food recovery service requesting a contract or written agreement, then it is at the discretion of the food recovery organization or the food recovery service to determine if they want to enter into such contract or agreement. A food recovery service or organization may wish to consider any costs associated with recovering additional food when deciding whether or not to enter into a contract or written agreement with a commercial edible food generator, thus subjecting them to a potential increase in costs. Please note, nothing in SB 1383's regulations prohibits a food recovery organization or a food recovery service from including cost-sharing specifications in their contracts or written agreements with commercial edible food generators.
3319	Elliott-McCrea, W., Second Harvest Food Bank Santa Cruz County	Reporting requirements The reporting requirements as written are simply unworkable as they would violate donor confidentiality. Instead, as food recovery groups have this information, jurisdictions should make requests - solely for pounds out of simplicity and consistency with generator donation metrics. The primary reporting responsibility	SB 1383's reporting requirements do not violate donor confidentiality. There is no requirement in SB 1383's regulations for food recovery organizations or food recovery services to report donor names. They are only required to report (to the jurisdiction that they are located in) the total pounds collected in the previous calendar year from the commercial edible food generators that they contract with or have written agreements with pursuant to Section 18991.3 (b). Reporting

Comment Number	Received From	Question/Comment	Response(s)
		needs to be owned by edible food waste generators, and it is important that information is shared with food banks so that we can develop agreements and partnerships with those generators.	the total pounds collected is critical for measuring progress and to help jurisdictions and CalRecycle identify if more capacity building needs to occur. With regard to the comment about requiring commercial edible food generators to report, it is not prudent to require each individual commercial edible food generator to report information to the jurisdiction. Such a revision would require jurisdictions to review and aggregate data from thousands of commercial edible food generators rather than a much smaller number of food recovery organizations and food recovery services. For example, one food bank could work with over a hundred commercial edible food generators. It is far more efficient and feasible for a jurisdiction to review one report from the food bank rather than 100 individual reports from generators that all work with the same food bank.
3809	Emami, R., City of Anaheim	Section 18984.7 -This section requires that containers at the end of their useful life are replaced with SB 1383 color-compliant containers. The City recommends that Ca/Recycle eliminate the need to replace containers at the end of their useful life with SB 1383 co/or-compliant containers, and instead mandate that all containers comply with the color requirements described above by 2032. This will allow jurisdictions to utilize current container inventories and allow for a uniform replacement of new containers and messaging throughout the jurisdiction.	The regulations provide that a jurisdiction is not required to replace functional containers, including containers purchased prior to January 1, 2022, that do not comply with the color requirements of this article prior to the end of the useful life of those containers, or prior to January 1, 2036, whichever comes first. Container Color Requirements need to be in place by the end of useful life of the containers or prior to January 1, 2036, whichever comes first. The regulations do not specify how containers are phased in. The regulations allow for phasing in at the discretion of the jurisdiction and their designees provided that the correct colors are phased in by 2036. Having a definitive replacement date is necessary to ensure that color is ultimately standardized to support generator education, which will help minimize contamination. Since these regulations will be adopted in early 2020, that will provide another two years, for a total of 16 years, for jurisdictions to plan for replacement of containers. Additionally, during that time nothing precludes a jurisdiction from placing labels on a container.
3810	Emami, R., City of Anaheim	Article 3 - Mandatory Organic Waste Collection Section 18984.1(a){S}{A} - This section states that carpets, non-compostable paper and hazardous wood waste are prohibited from being placed in the green container. This subset is limited in scope and should be expanded. Currently the California Department of Food and Agriculture (COCA) restricts movement of certain organics within quarantine zones and this material should not be included in the green containers. This is addressed elsewhere in the proposed regulation text for non-local entities and at the facility level when measuring organic recovery rates, but not at the point of collection. The City recommends that CalRecycle amend the list of prohibited materials to include "material subject to a quarantine on movement issued by a county agricultural commissioner." Alternatively, the definition of organic waste in Section 18982(0)(46) could be amended to state "material subject to a quarantine on movement issued by a county agricultural commissioner is considered incompatible materials rather than organic waste.	Thank you for the comment. CalRecycle added language in Section 18984.13 to address quarantined waste.
3811	Emami, R., City of Anaheim	Section 18984.11(a){2} - This subsection allows for jurisdictions to waive organics program requirements due to limited physical space. The City recommends that CalRecycle clarify what constitutes "evidence demonstrating a lack of adequate space."	CalRecycle has not included implementation standards or minimum documentation requirements to allow jurisdictions set appropriate criteria. Jurisdictions, not haulers, administer the waiver, so the physical space waiver will not result in a race to the bottom in nonexclusive service areas. A hauler, licensed architect, or licensed engineer may provide evidence that a premise has a legitimate space constraint. If a jurisdiction has concerns about haulers in nonexclusive service

Comment Number	Received From	Question/Comment	Response(s)
			areas, they can opt not to issue waivers or use a qualified source other than a hauler to demonstrate lack of adequate space for separate organic waste containers.
3812	Emami, R., City of Anaheim	<p>Section 18986.l(a)(l)(A) - This section states that textiles, carpets, plastic coated paper, and human or pet waste may not be collected in the blue container for non-local entities. This requirement appears to be incongruent with the requirements placed on local entities.</p> <p>The City recommends that Ca/Recycle amend the definition to align with the requirements placed on jurisdictions in Sections 18984.1 and 18984.2.</p>	Thank you for the comment. CalRecycle amended the applicable sections for consistency.
3813	Emami, R., City of Anaheim	<p>Section 18985.l(f)- This section requires public education materials in various languages if more than 5% of the jurisdiction's population is identified as a "limited English speaking household," or as "linguistically isolated" by the U.S Census Bureau. The City recommends that CalRecycle consider increasing the percentage threshold to reduce the cost associated with preparation of public education materials in multiple languages.</p>	Comment is on text that was removed from the final regulation and replaced with reference to the Government Code Section 7295 linguistic standards.
3814	Emami, R., City of Anaheim	<p>Section 18985.2(a) -This section requires that each jurisdiction develop a list of edible food recovery services and organizations operating within each jurisdiction and post the information on their website.</p> <p>The City recommends that Ca/Recycle consider establishing a State-wide database similar to FACIT where food recovery service providers and organizations can register and provide their information once for access to all jurisdictions and generators.</p>	<p>Although CalRecycle intends to provide tools and resources prior to 2022 to assist with SB 1383 edible food recovery regulatory compliance, it is critical that jurisdictions develop their own lists of food recovery organizations and services operating in their area.</p> <p>Developing a list that includes food recovery organizations and services that have sufficient capacity and a proven track record of safely and efficiently recovering food for human consumption will help jurisdictions assess their edible food recovery capacity and identify capacity needs that exist. In addition, developing local lists will help commercial edible food generators find organizations and services that are capable of safely handling and distributing recovered food on a regular basis in their area.</p> <p>The list is intended to serve as a tool to help commercial edible food generators find appropriate food recovery organizations and services to establish a contract or written agreement with, and thereby help ensure that edible food in the jurisdiction is not sent to landfills, but rather put to its highest and best use of helping to feed people in need.</p>
3815	Emami, R., City of Anaheim	<p>Section 18982(a)(65) - This section defines a route review as visual inspection of containers along a hauler route for the purpose of determining container contamination. Without specifying a minimum quantity of inspections per route, the regulations may result in a "race to the bottom" where haulers or jurisdictions are inspecting minimal containers per route. Another concern is an inconsistent interpretation or application of the minimum standards by Local Enforcement Agents.</p> <p>The City recommends that CalRecycle amend this definition or the corresponding enforcement section {18984.5} to specify a minimum percentage of containers or customers along the route to be inspected.</p>	<p>Comment noted. For clarity, the regulations allow the jurisdictions to determine random selection, which is the least costly and burdensome approach compared to requiring statistically significant sampling. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements.</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization. For clarity, the regulations allow the jurisdictions to determine random selection, which is the least costly and burdensome approach compared to requiring statistically significant sampling.</p>
3816	Emami, R., City of Anaheim	<p>General - This article will require a significant expenditure by jurisdictions throughout California to staff the enforcement efforts, including but not limited to: route reviews, compliance reviews, contamination monitoring, follow-up site visits, and the issuing of fines. During the enforcement workshop, CalRecycle suggested the potential for CalRecycle to perform the enforcement on behalf of agencies, similar to how agencies can arrange for Cal Recycle to be the Local Enforcement Agency for regulating solid waste facilities.</p> <p>The City recommends that Ca/Recycle provide an option for jurisdictions to contract with Ca/Recycle to perform the inspection and enforcement procedures.</p>	<p>A change to the regulatory text is not necessary. CalRecycle will not be contracting with jurisdictions to perform inspection and enforcement actions. There are insufficient resources at the state level to contract out for jurisdictions.</p>
3817	Emami, R., City of Anaheim	<p>Article 14. Enforcement Requirements</p> <p>Section 18995.l(a)(l)(A) - This section states that compliance reviews and route reviews shall be conducted to ensure compliance with the generator requirements outlined in Section 18984.9. The City recommends that Section 18995.l(a)(l)(A) be amended to require that compliance reviews and route reviews ensure compliance with the generator requirements set forth in Section 18984.9(a).</p>	<p>CalRecycle has revised section 18995.1(a)(1)(A) in response to this comment. Section 18995.1(a)(1)(A) has been revised to state that a jurisdiction shall determine compliance with the organic waste generator requirements set forth in section 18984.9(a). The clarification was added by adding the (a) to exempt jurisdictions from the requirements in subsections (b) through (e) of section 18984.9.</p>
3818	Emami, R., City of Anaheim	<p>Section 18997.2(d) -This section states that the penalty amount for each violation (subject to range limitations) will be determined through a qualitative process. It is likely that the current process will result in an uneven application of fines across jurisdictions.</p> <p>The City recommends that this section be amended to include a quantifiable</p>	<p>A change to the regulatory text is not necessary. Section 18997.3(d) has been changed to 18997.3(c) due to deletion of the penalty tables and the addition of the new penalty structure outlined in section 18997.3(b). The factors listed in Section 18997.3(c) are commonly used when determining a penalty amount. The penalty range may be used to consider aspects such as but limited to, the population of a jurisdiction. CalRecycle will not be including a quantifiable penalty formula in the regulations.</p>

Comment Number	Received From	Question/Comment	Response(s)
		formula for determination of fines that eliminates subjectivity and the potential for inconsistent application.	
3819	Emami, R., City of Anaheim	Section 18997 .S{d) -This section states that upon receipt of an accusation of violation, a jurisdiction has 15 days to file a request for a hearing. Additionally, this section prescribes an expedited time frame for imposition of penalties, leaving jurisdictions little time to investigate potential violations and respond thoughtfully. The City recommends that jurisdictions receive a minimum of 45 days to investigate the accusation and request a hearing.	The 15 day window for requesting a hearing is modeled on the timeline for regulated solid waste facilities in Public Resources Code Section 44310. Provisions were included in Section 18994.1 for jurisdictions to report the primary contact person in the jurisdiction and the agent for service of enforcement process, if different. The purpose of these provisions was to ensure that enforcement process is routed to the proper individual within a jurisdiction. It is incumbent upon that individual to ensure the process material is routed efficiently and appropriately. In addition, the commencement of a penalty proceeding is only allowed to occur following a notice of violation process in which the jurisdiction will be on notice with an opportunity to correct. By the time a penalty accusation is served, a jurisdiction should be aware of a violation and the issues involved and the informational bar for requesting a hearing is set low.
3820	Emami, R., City of Anaheim	Section 18997.S(e) - This section states that if a party waives their right to a hearing, there is a potential to enter a settlement agreement. It is unclear how the settlement process could or should be conducted. The City recommends that this section be amended to provide guidance and parameters for settlements, or at a minimum contains a reference to the appropriate document that does provide this information.	A change in the regulatory text is not necessary. It is unclear on what parameters the commenter is suggesting, but in general, adding such parameters to the language may unduly restrict the discretion of the parties in reaching adequate settlement.
3821	Emami, R., City of Anaheim	Section 18995.2 - SB 1383 currently requires a voluminous centralized repository for all information related to SB 1383 programs, which entails over 40 units of observations and potentially millions of data points. Subsection 14.2 (c) requires that the jurisdiction shall provide access to the implementation record within one business day of request. The City recommends that the timeframe for providing or reviewing the implementation record be changed for consistency with The California Public Records Act, which indicates an agency must provide the records within a reasonable period of time and allows a ten-day period for response.	CalRecycle has revised section 18995.2 (c) in response to this comment to allow for 10 business days rather than one.
3641	Etherington, K., Central Contra Costa Solid Waste Authority	I. Reporting - The draft regulations include extensive requirements for reporting and record keeping. These include: <ul style="list-style-type: none"> <li>• Article 3. Record Keeping: Waivers and Exemptions</li> <li>• Article 4. Record Keeping Requirements for Compliance with Education and Outreach Requirements</li> <li>• Article 7. Compliance with Jurisdiction Hauler Program</li> <li>• Article 10. Record Keeping: Jurisdiction Edible Food Recovery Program</li> <li>• Article 11. Schedule for Reporting: Organic Waste Recycling Capacity Planning</li> <li>• Article 12. Record Keeping Requirements: Recovered Organic Waste Procurement Target</li> <li>• Article 13. Reporting</li> <li>• Article 14. Implementation Record and Record Keeping: Enforcement Requirements</li> </ul> Although record keeping and reporting are necessary components of measuring progress, excessive use of these activities can distract jurisdiction staff and	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.

Comment Number	Received From	Question/Comment	Response(s)
		<p>resources from the more important work of implementing and operating the actual programs that will divert organic waste. CalRecycle staff are already aware of the extensive reporting requirements and record keeping that is required in the current annual reporting format, especially in areas of mandatory commercial recycling (MCR) and mandatory organics recycling (MO Re). The requirements for reporting in the draft SLCP regulations make reporting more complex, staff intensive, and increase the potential for inaccuracy.</p> <p>RecycleSmart requests that CalRecycle staff reconsider the amount of reporting and record-keeping required to only the most critical information needed to measure progress toward the goals of SB1383. Reducing the level of record keeping and reporting will allow staff to focus efforts and resources on effective program implementation, management, and education &amp; outreach.</p>	
3642	Etherington, K., Central Contra Costa Solid Waste Authority	<p>Enforcement - Within Section 18996.2 (Department Enforcement Actions Over Jurisdictions), the draft regulations describe immediate issuance of a Notice of Violation in instances where a jurisdiction fails to comply with any part of the extensive program requirements. Under AB939, CalRecycle may consider a jurisdiction's "Good Faith Effort" (GFE) in implementation and management of required programs. However, in the draft SLCP regulations, GFE is replaced by "Substantial Effort" and "Extenuating Circumstances" which are much narrower in the protections they provide to jurisdictions. With a less complex regulation, this might not be an issue, but the extensive program requirements in the draft SLCP regulations and the possibility that not all may be met within a required timeframe makes the lack of a true GFE consideration a real concern.</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>
3643	Etherington, K., Central Contra Costa Solid Waste Authority	<p>Penalties -Article 16 (Administrative Civil Penalties) lists the violations and "penalty severity levels" (monetary fines) for not meeting the requirements of this regulation. The regulations currently include thirty-nine (39) violations in areas of jurisdiction compliance with collection services, jurisdiction compliance with organic waste recovery education and edible food recovery education, jurisdiction compliance with CalGreen and Procurement, and jurisdiction adoption and enforcement of ordinances. Unlike the AB939 mandated requirements for implementation of all required source reduction and recycling measures and meeting the 50% diversion target, the draft regulations have an extensive list of violations with fines ranging from \$500 to \$10,000 per day. This creates an environment where jurisdictions will be more concerned with implementation of all required programs rather than selective program implementation based on local needs, staffing levels, funding, and resources.</p> <p>RecycleSmart requests that CalRecycle reduce the number of jurisdictional violations and the fines associated with violations. Institute a Good Faith Effort determination for those instances where a jurisdiction has attempted to respond to requirements of the regulations but not met the desired performance standard. Consider CalRecycle staff review and assistance to jurisdictions prior to issuing fines.</p>	<p>The legislature amended SB 1383 to strip the requirement that CalRecycle use the "Good Faith Effort" requirement of AB 939 (Sher, Chapter 1095, Statutes of 1989) for enforcement for SB 1383. SB 1383 requires a more prescriptive approach and state minimum standards; jurisdictions must demonstrate compliance with each prescriptive standard. CalRecycle does exercise its enforcement discretion to allow consideration of "substantial efforts" made by the jurisdiction and the placement on a "Corrective Action Plan" (CAP). This effectively allows CalRecycle to consider efforts made by a jurisdiction, while not absolving them of responsibility. This structure allows CalRecycle to focus on compliance first and dedicate enforcement efforts to egregious offenders. The 75 percent organic waste diversion target in 2025 will not be reachable with the longer compliance process under the Good Faith Effort standard. Implementation of the prescriptive regulatory requirements of the regulation are designed to achieve the organic waste reduction targets, which is consistent with the explicit statutory direction</p>

Comment Number	Received From	Question/Comment	Response(s)
6005	Etherington, K., RecycleSmart	Work with Dept of Pub Health and local Enviro Health Depts regarding food recovery, transfer requirements, and conflicts with existing regs and standards.	Comment noted. Commenter is expressing an opinion regarding how the regulations should be implemented once finalized.
6006	Etherington, K., RecycleSmart	Identify costs and potential funding sources associated with edible food recovery	<p>CalRecycle recognizes that there is a lack of sustainable funding for food recovery infrastructure and capacity in California. To address this, CalRecycle included language in Article 10, Section 18991.1 stating that a jurisdiction may fund the actions taken to comply with the jurisdiction edible food recovery program requirements through franchise fees, local assessments, or other funding mechanisms. If a jurisdiction decides to fund their edible food recovery program through franchise fees, local assessments, or other funding mechanisms, then it is at the discretion of the jurisdiction, not CalRecycle, to determine how the funding will be dispersed.</p> <p>CalRecycle would also like to note that SB 1383 provides a broad grant of authority to jurisdictions to “collect fees to recover the local jurisdiction’s costs incurred in complying with the regulations...” The types of fees a jurisdiction may impose are not limited to tip fees or franchise fees. That said, some jurisdictions in California are already successfully using such fees to fund food recovery operations and activities.</p> <p>In addition, CalRecycle also is heavily focused on increasing food recovery infrastructure and capacity in California. CalRecycle’s Food Waste Prevention and Rescue Grant Program funds food waste prevention and food recovery projects across the state. To date, CalRecycle has awarded \$20 million dollars to over 60 grantees; the majority being food recovery organizations and services.</p>
6007	Etherington, K., RecycleSmart	RE schools and school districts: calrecycle should be the primary provider of assistance in establishing and implementing program requirements, including for edible food recovery	Local jurisdictions should still provide education to non-local entities and local education agencies within their geographic boundaries, as they already are doing under AB 1826 and AB 341. It is Important for these entities to know what collection options are available locally. CalRecycle will also provide assistance to local education agencies in implementing programs. The regulations already provide that compliance with this provision by these entities would be enforced by CalRecycle.
6008	Etherington, K., RecycleSmart	CalRecycle should provide the cost implications for the programs required by the regs, including identifying funding available from the state	CalRecycle prepared a SRIA to evaluate the economic impacts of the proposed regulations. CalRecycle is also exploring opportunities to provide support funding for implementation of the regulatory requirements
6009	Etherington, K., RecycleSmart	CalRecycle should consider less prescription in the regs and establish organics reduction/diversion goals. Allow jurisdictions to develop program solutions that fit local needs.	<p>Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA).</p> <p>CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were</p>

Comment Number	Received From	Question/Comment	Response(s)
			established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
3025	Evans-Fudem, E., League of California Cities	Infrastructure Capacity: As we have noted, California lacks sufficient capacity today to be able to meet the needs for new organic waste processing. Many cities have expressed concern over an ability to comply with organic waste diversion requirements due to a lack of waste disposal infrastructure. There is an uneven distribution of waste disposal infrastructure, such as bio-digesters, across the state. Moreover, where the infrastructure does exist, capacity is limited. While the regulation provides five years to implement programs, cities are concerned that this is not sufficient time to develop and permit new facilities.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
3026	Evans-Fudem, E., League of California Cities	Funding: Lack of sufficient funds continues to be among the major challenges local governments face in the effort to implement new organic waste diversion programs. The League and others continue to seek solutions to address the need for substantial public sector funding. For example, for a number of years, we have urged that "Cap-and-Trade" proceeds be used to help offset the costs for developing organic recycling infrastructure. However, even if additional appropriations were made to the Waste Diversion Program, it will not address much of the local need. Local governments continue to work to address the need for funds to undertake prescribed activities, such as updating bins and labels, as well as providing education and outreach.	SB 1383 provides the authority for jurisdictions to charge fees to offset the costs of implementing the proposed regulations. CalRecycle is also looking into methods to direct supplemental funding to local jurisdictions to assist in implementation.
3027	Evans-Fudem, E., League of California Cities	Enforcement: These regulations allow for Corrective Action Plans and establishes extended timelines and milestones for achieving compliance. We appreciate the addition of a pathway to compliance. This is a step in the right direction and we continue to urge careful consideration of the differences among local jurisdictions, as well as the variety of community stakeholders, and infrastructure challenges a local jurisdiction may face.	Thank you for the comment. The comment is in support of current regulation language.
3028	Evans-Fudem, E., League of California Cities	Penalties: The penalties outlined in these regulations are premature. If the purpose of penalties is to ensure generators are sufficiently deterred from non-compliance, this regulation puts the cart before the horse by designing penalties before the sticking points and needs of generators are understood. We encourage CalRecycle	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations

Comment Number	Received From	Question/Comment	Response(s)
		<p>to continue working through the programmatic scheme before implementing an appropriate set of penalties, particularly since programs have until 2022 to be implemented. We ask that CalRecycle adopt penalties in a second set of regulations to take effect at a future date.</p>	<p>“may include penalties to be imposed by the Department.” This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations that require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.</p>
3029	Evans-Fudem, E., League of California Cities	<p>Procurement: New procurement requirements in these proposed regulations require local governments to purchase recovered organic waste products targets set by CalRecycle. We anticipate these requirements will result in substantial additional costs to local governments, over and above the costs we already anticipate to comply with the extensive programmatic requirements of the proposed regulations. We ask that CalRecycle instead work to develop markets for such materials in a second regulatory proceeding.</p> <p>The League further notes the additional costs that will result from complying with the procurement regulations represent an unfunded state mandate under Cal. Const. Art. XIII B, sec. 6(a) as the regulations would impose a new program on cities and neither the draft regulations nor the Initial Statement of Reasons identifies a state funding source. CalRecycle should not rely on the fee authority granted to local jurisdictions in SB 1383. Any fee that a city attempted to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, sec. 1(e) (Prop. 26) as it would not meet any of the exceptions identified in that section. Further, even were a fee to survive scrutiny under Prop. 26, it is questionable whether a city would not have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII D, sec. 6 (Prop. 218.) This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929). For these additional reasons, the League requests that the procurement regulations be addressed in a separate regulatory proceeding.</p>	<p>CalRecycle has determined that procurement requirements are necessary to achieve the statutory organic waste diversion targets by ensuring an end use for processed organic waste. In addition, CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate.</p> <p>First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, “No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.” Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)).</p> <p>Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a “tax” under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a</p>

Comment Number	Received From	Question/Comment	Response(s)
			form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.
6280	Flood, M., LA Regional Food Bank	As the language in Articles 10 and 11 recognize, there are significant labor and infrastructure resources that are needed to obtain, process, and distribute food. The state and local jurisdictions will only be able to achieve this goal with an appropriate investment in the capacity and physical infrastructure of emergency food recovery organizations to increase the volume of food they receive, store and distribute. To that end, we are grateful to see the January 18 draft regulations include language in Article 10 about jurisdictions being able to fund these activities through avenues such as franchise fees and local assessments, as well as the ability for generators to self-haul and enter into contracts directly with food recovery organizations. We are in strong support of these funding mechanisms, which must be included in the final language, but urge that the capacity planning process in Article 11 be expanded to formally include stakeholders such as emergency food groups, to properly inform jurisdictions about gaps and needs. Furthermore, it is important that the final state and local regulations recognize as fundamental to this work that food recovery organizations' participation is voluntary, given the existing strains on the budgets of under-resourced non-profits and largely volunteer labor force engaged in food recovery.	This comment is in support of SB 1383's edible food recovery capacity planning process and requirements specified in Article 11 and language that was included in Section 18991.1. Regarding the comment that the capacity planning process in Article 11 be expanded to formally include stakeholders such as emergency food groups, to properly inform jurisdictions about gaps and needs. Section 18992.2 states that in complying with this section the county in coordination with jurisdictions and regional agencies located within the county shall consult with food recovery organizations and food recovery services regarding existing, or proposed new and expanded capacity that could be accessed by the jurisdiction and its commercial edible food generators. It is inherent in the requirements of Section 18992.2 (a)(2)-(4) that counties, in coordination with jurisdictions and regional agencies located within the county, will have to consult with food recovery organizations and services which will likely include emergency food groups.
6279	Flood, M., LA Regional Food Bank; Goodwin, A., Redwood Empire Food Bank; Coffaro, D., Second Harvest Food Bank of Orange County; Hall, V., Feeding San Diego; Flood, M., LA Regional Food Bank	First, in consultation with our food bank partners, we agree with input provided by our state association of food banks that significantly refined comments regarding data collection in Article 13 offering an improved approach, and urge the Department to scale back and reimagine the role of emergency food providers in the data reporting process to avoid the unworkable and burdensome program, as currently written. We	A change to the regulatory text was not necessary because it was not clear what the commenter meant by "reimagine the role of emergency food providers in the data reporting process." Without a clear and detailed description of what was meant by asking CalRecycle to "reimagine the role of emergency food providers in the data reporting process," CalRecycle could not make a determination about whether a revision to the regulatory text was warranted. CalRecycle could like to mention that SB 1383's reporting requirements do not violate donor confidentiality. There is no requirement in SB 1383's regulations for food recovery organizations or food recovery services to report donor names. They are only required to report (to the jurisdiction that they are located in) the total pounds collected in the previous calendar year from the commercial edible food generators that they contract with or have written agreements with pursuant to Section 18991.3 (b). Reporting the total pounds collected is critical for measuring progress and to help jurisdictions and CalRecycle identify if more capacity building needs to occur.
6301	Foster, C., City of Oceanside	Article 1 Section 1(a)(62)- This section defines Renewable Natural Gas Transportation Fuel as derived " ... from organic waste diverted from a landfill and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste." This definition may be interpreted to exclude renewable natural gas transportation fuel which is derived from sewage sludge anaerobic digestion or co-digested operations, which is likely the result of the City's integrated approach to organic food waste and biosolids. Accordingly, the City respectfully requests this definition be amended to read: " .... gas derived from organic waste processed in an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 or Title 23."	CalRecycle disagrees with the commenter's argument to allow renewable gas derived solely from sewage sludge to be eligible for procurement. The regulations clarify that only renewable gas derived from organic waste received at a POTW from solid waste facilities may count towards a jurisdiction's procurement target. Other materials digested at a POTW, such as sewage sludge, are ineligible. Renewable gas derived solely from sewage sludge is ineligible for procurement because a POTW is not a solid waste facility and therefore not in the scope of the legislative intent of SB 1383. Sewage sludge is also not typically destined for a landfill, so its use does not help achieve SB 1383's landfill diversion goals. For the reasons noted above, gas generated from the inflows of a sewer system and not from organic waste diverted from the solid waste stream cannot logically be considered a recovered organic waste product. It is inconsistent with the requirements of SB

Comment Number	Received From	Question/Comment	Response(s)
			<p>1383 to incentivize or mandate activities that do not contribute to landfill diversion of organic waste.</p> <p>However, POTWs that accept food waste can technically do so without a solid waste facility permit, they are explicitly authorized to do so per Title 14, making it functionally similar to incentivizing biomethane from a solid waste facility. Therefore it is justifiable to allow the portion of renewable gas resulting from the digestion of food waste that is recovered at POTWs that accept food waste from a facility or operation identified in Section 18993.1(h)(1)(A)-(C) to count toward the procurement targets.</p>
6302	Foster, C., City of Oceanside	<p>Article 2 Section 2.1(b)(2)- This section identifies community composting, as defined in Section 18982(a)(8) as a means of acceptable landfill reduction. Even though the City strongly believes community composting plays an integral role in integrated organics management, the City is concerned that SB 1383 draft language does not adequately provide oversight to ensure that high diversion is being achieved through this method, and that this method does not present any potential nuisance, vector, and/or odor issues. Accordingly the City recommends that Ca/Recycle consider including language that requires community composting operations/haulers/operators: remain below required thresholds for facility size; store and handle materials in a manner to protect public health and safety and the environment; and control vectors, fires, odors and nuisances; and to provide annual reporting of operations, generators, and education to local jurisdiction annually.</p>	<p>Community composting, as specified in Section 17855(a)(4), is an excluded activity and therefore does not require a solid waste facility permit or EA Notification. CalRecycle determined during the rulemaking process for the 2015 compostable material handling rulemaking that the small size of these operations does not represent a significant enough threat to public health, safety, or the environment to require permitting. To ensure oversight, however, a solid waste Enforcement Agency may inspect these activities to verify that continued qualification as an excluded activity and may take any necessary enforcement action.</p>
6303	Foster, C., City of Oceanside	<p>Article 2 Section 2.1(b)(4)- This section includes a Biomass Conversion operation as constituting a reduction of landfill disposal; however, it specifies that biomass conversion operations are to be per Section 40106 of the Public Resources Code. Section 40106 of the Public Resources Code excludes materials that contain "sewage sludge". The market for land application of biosolids in southern California is limited. Accordingly, the City currently land applies its biosolids by shipping them to Arizona. While it is the intent of the City to identify and exploit local markets for land applying biosolids as part of the Master Plan, land application is subject to market forces which are beyond the City's control. Should the land application market decline or the market for biochar (byproduct of incinerated biosolids) surge, biomass conversion of sewage sludge is an alternative for treatment that would reduce landfill disposal. Additionally, for facilities that codigest food waste and biosolids (which is the likely outcome for the City's project), biomass conversion does not appear to be in conformance with the proposed rules. Accordingly, the City recommends that Ca/Recycle consider including biomass conversion of materials that contain sewage sludge as reducing landfill disposal.</p>	<p>The commenter raises an issue that is in conflict with statutory limitations on what can be permitted as a biomass conversion facility in California that would require changes to statute. Although the process described could theoretically be handled under Section 18983.2 as an alternative process or technology, permitting of such a facility would remain a challenge.</p>
6304	Foster, C., City of Oceanside	<p>Article 2 Section 2.1(b)(6)(B)(1)- This section includes land application of biosolids as constituting a reduction of landfill disposal; however, it specifies that land applied biosolids shall have undergone anaerobic digestion or composting as defined in Part 503, Title 40 of the Code of Federal Regulations, Appendix B. Appendix B provides detail on a suite of Class B and Class A pathogen reduction technologies, which includes far more options for each Class, which are all deemed equivalent to</p>	<p>At this time, staff cannot confidently conclude that the specific pathogen treatment processes used to safely apply biosolids to land, other than composting and anaerobic digestion, reduce greenhouse gas emissions to the benchmark value of 0.30 MTCO<sub>2e</sub> per short ton organic waste. CalRecycle evaluated the BEAM model referred to by one commenter and determined the model does not provide enough detail to evaluate whether the greenhouse gas emission factors used are peer reviewed. Additionally, the BEAM model estimates carbon sequestration benefits of compost</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>anaerobic digestion or composting. While the City of Oceanside currently utilizes anaerobic digestion to treat biosolids, the City may need to construct new infrastructure in the future to treat additional organic wastes at the site (either those generated within the City or regionally). Limiting the treatment technologies to anaerobic digestion and composting may eliminate optimal treatment options for the City that are not in conflict with the State's Goals.</p> <p>Accordingly, the City recommends that Ca/Recycle replace the words " .... anaerobic digestion or composting .... 11 With " ..... one of the processes, .... 11 to enable all pathogen reduction technologies to be considered.</p>	<p>applications, which are not permanent and thus cannot be used to meet the requirements of the proposed regulation. Thus, a change to the regulation is not appropriate at this time. Staff notes that any process or technology not specified in Section 18983.1 as a reduction of landfill disposal, including the pathogen reduction processes mentioned previously, may be submitted and evaluated in accordance with the requirements of Section 18983.2.</p>
6305	Foster, C., City of Oceanside	<p>Article 3 Section 3.l(a)(G)- This section narrowly identifies the collection options for organic waste. This section only provides opportunities for source separated collection through a two cart system, three cart system, four cart system, and/or split cart system. It fails to permit a yellow bag system that would allow the generator to source separate food waste organics into a yellow bag, and place that yellow bag into the green waste cart, to then be collected, and removed for processing at an organics recycling facility. Current sorting and preprocessing systems can guarantee minimal contamination with a yellow bag program, equal to, receiving systems for two carts, three carts, four carts, and split cart systems. Current systems have proven this technology can work, and can ultimately result in high diversion through anaerobic digestion, composting, and other technologies. Furthermore, the yellow bag system allows for jurisdictions to achieve high diversion, without needing to replace transportation infrastructure (collection vehicles for split carts); cart infrastructure; and/or citing a compost facility in dense urban areas, that have limited options when it comes to land, resources, and permitting capability. The draft language as it stands today, limits our City's opportunity for diversion, and further requires the City to consider options that would not be cost effective, and could ultimately result in greater contamination, lack of community buy-in (4th cart), and increased greenhouse gas emissions from additional routing truck traffic. Accordingly the City recommends that Ca/Recycle consider adding language that will permit the use of a yellow bag food waste/organics collection program within the green waste cart.</p>	<p>The commenter's situation is addressed in the regulations. CalRecycle revised Sections 18984.1, 18984.2, and 18984.3(e) to provide clarity about when a jurisdiction may allow plastic bags to be placed in containers. The issue of whether to allow bags hinges primarily on whether or not the receiving facility will accept them. Many facilities are not accepting bags because of operational problems and product quality issues. In order to document jurisdiction decisions about the use of bags, CalRecycle also revised Section 18984.4(a) to require that jurisdictions keep information in their records about the facilities to which they send bags.</p> <p>It would be acceptable for the facility to provide the letter to the hauler and the hauler would provide the letter to the City.</p> <p>Nothing precludes a facility from specifying the type of resins and products the facility will accept. The written notification from the facility is given to the jurisdiction every 12 months after the regulation takes effect. As many stakeholders have noted markets and technology is are dynamic. A solid waste facility needs the ability to determine that accepting plastic bags or compostable plastics is no longer feasible and have the ability to notify a jurisdiction. This may trigger and require behavior change for the collection program in order to improve overall recovery. The notification requirement is intended to foster this. The requirement to annually check with the facility that bags are still allowed is not onerous or burdensome.</p>
6306	Foster, C., City of Oceanside	<p>Article 3 Section 5.(b)- The City understands that in order for organics diversion to be successful, contamination must be addressed through outreach, monitoring, reporting and enforcement, and as a result the City further understands Cal Recycle's interest in directing contamination oversight.</p> <p>However, this section currently provides overly prescriptive direction on how a jurisdiction is to monitor and report on contamination. Quarterly route reviews by the Jurisdiction, along with mandatory immediate route reviews by the Jurisdiction if the hauler or solid waste facility operator identifies any level of contamination is not reasonable, and overly burdensome to the jurisdiction. Oceanside's service area covers over 175,000 residential customers, along with several thousand commercial customers. Quarterly route reviews, reporting, and pre- and posteducation would</p>	<p>Comment noted. Under Section 18995.1, states that a jurisdiction shall conduct a sufficient number of route reviews and inspections of entities to adequately determine overall compliance with the Chapter. It is not intended for a route review to include the inspection of every container on a route, but a random sampling of containers during the year. Section 18995.1 also states a jurisdiction shall have an overall inspection and enforcement program that is designed to ensure overall compliance with the Chapter. This allows the jurisdiction the flexibility and discretion to develop programs that set minimum standards and best fits their jurisdiction. CalRecycle also modified the regulations to annual. During the informal rulemaking period, stakeholders commented on the difficulty of measuring contamination on a volume or weight basis, the associated costs, and the inability to justify a particular percentage. In response, CalRecycle</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>be too burdensome to our jurisdictions staffing resources, costly and could result in unreasonable nuisances to the public. Additionally, the current proposed language does not clearly identify what minimal levels of contamination are allowed, or what level of contamination warrants further investigation. Without clear guidance on contamination levels, jurisdictions could face arbitrary requests to investigate for contamination. Accordingly, the City recommends Ca/recycle consider revising this section to require annual inspections of all routes, and further add limiting language that clarifies what constitutes significant contamination, and as a result requires additional investigation.</p>	<p>modified the contamination monitoring provision to eliminate the percentage threshold and allow more flexibility to jurisdictions, while still maintaining enforceable requirements. Moreover, in response to comments received during the 45-Day comment period, CalRecycle revised the contamination monitoring provision to allow primarily solid waste facility based monitoring, as an alternative to requiring jurisdictions to conduct individual route reviews. These changes will result in a less costly alternative that will still have the desired results in addressing contamination. This could result in increased inspections and follow-up education in areas where there is consistent contamination, with associated savings of not having to conduct reviews in areas that do not exhibit consistent contamination. It would also address the issue of what constitutes significant contamination, because the facility would sample and measure contamination levels.</p> <p>CalRecycle disagrees with the recommendation to exempt residential routes from the, since the residential section makes up approximately more than half of organic waste generation. The revisions to Section 18984.5 address the cost issues raised by this comment. CalRecycle also disagrees that contamination monitoring should be totally at the discretion of jurisdictions. However, CalRecycle revised Section 18984.5(c)(1) to remove the term 'physically.' This change is necessary to allow jurisdictions to use video monitoring to inspect the containers. This change would be in alignment with the definition of "route review" in Section 18982 (a)(65) which allows the use of cameras to determine container contamination.</p> <p>In addition, nothing would restrict a jurisdiction from developing its own requirements for how the facility would conduct waste characterization.</p>
6307	Foster, C., City of Oceanside	<p>Article 3 Section 6(a)(3)(A)· This section requires the jurisdiction to maintain for records and production as requested by CalRecycle all documentation related to the implementation, outreach, and enforcement of this law. This includes overly prescriptive requirements to maintain any and all written and oral based records, which include the reporting of any oral or "direct" interactions with the public on the organics program. This is nearly impossible, considering our team interfaces with the public dozens of times, every day both casually and formally, which could ultimately result in the need to produce thousands of pieces of documentation for basic public interface and outreach needs. Accordingly the City recommends Ca/Recycle consider removing Section 6{a}{3}(A) in its entirety, and if needed, replace this section with a requirement to provide a summary of how the jurisdiction handles "direct" interactions with the public, with a recommendation for the jurisdiction to provide samples of direct interactions and/or basic scripts for public interface.</p>	<p>This requirement was removed from the text.</p>
6308	Foster, C., City of Oceanside	<p>Article 3 Section 5(b)(1)· This Section requires that all carts/containers be adequately labeled, and further requires that in order to comply, the language specifically states that jurisdictions must place labels on all containers commencing January 1, 2022. In order to use existing infrastructure, under this requirement, our City would have to produce and physically place new labels on over 90,000 residential carts, and over 15,000 commercial containers. Our City lacks significantly in the staffing and</p>	<p>Thank you for the comment regarding the additional time, great cost savings, and easier compliance with the container color and label requirements.</p> <p>This section is necessary to ensure that containers are properly labeled which is necessary to ensure that collected organic waste is clean and recoverable. The section specifies that a jurisdiction may comply by placing a label (e.g., sticker or hot-print) with text or graphics indicating acceptable materials for that container on the body or lid of the container, or by imprinting text or graphics on the body or lid of the container that indicate which materials may</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>financial resources to accomplish this, and would be further limited by the difficulty in ensuring all customers place their carts out properly for physical labeling. Additionally, due to our high turnover rate from tourism, military, and general seasonal migration, many carts are not placed out for servicing on collection dates, further making labeling by the jurisdiction not effective. In order to be efficient, cost effective and timely in this process, would Ca/Recycle permit a jurisdiction to mail labels to generators (commercial and residential) in lieu of physical placement, and if so, would Ca/Recycle consider amending this section to reflect this option as compliance?</p>	<p>be accepted in that container. The labeling requirements were refined through the informal public rulemaking process to accommodate the various types of labels jurisdictions currently use on their containers. Stakeholders indicated that these types of labels are effective and durable. Correctly-colored labels may be applied to existing bins or lids until the containers are replaced at the end of their useful life.</p> <p>Labeling requirements, commencing January 1, 2022, only apply to new containers or lids. Thus, imprinting of labels would be directly onto new containers, either at the end of old containers' useful life or by 2036.</p> <p>A jurisdiction's designee can place labels on the containers.</p> <p>The regulations already apply to all containers provided by a hauler, including temporary dumpsters. The regulations specify that all containers provided by a hauler must meet both the container color and container label requirements by 2036. However, the regulations do allow for either the lid or the body to meet the color requirement.</p> <p>With respect to compactors owned by private businesses and not the hauler, the containers may conform with either the container color requirements or the container label requirements.</p> <p>In regards to the interior containers, this was the least costly and burdensome approach and still achieves the necessary organic disposal reduction. Those businesses subject to AB 827 will have to meet that statute's signage requirements. Nothing in these SB 1383 regulations precludes a jurisdiction from requiring businesses to have signage.</p> <p>In regards to the lid comment, a change was made to allow for the exposed portion of lid or body to be required color and to allow the required color to be on either the lid or the body, not just the lid. The change is necessary because this approach is the least costly and burdensome one that still achieves the organics disposal reductions.</p> <p>For the text and graphics, this section references that primary materials must be included. If there is a change in the primary materials, then the information would need to be updated as containers are replaced. The regulations are allowing flexibility on size of the label (text and graphics), the requirement is only for primary materials, and all containers need labels. However, this includes all containers and residential/non-residential. Also, for consistency purposes, CalRecycle revised Section 18984.8(c)(1) to mention primary items.</p> <p>In regards to the new technology, CalRecycle is unclear on how that will help educate the generators.</p> <p>Nothing prohibits jurisdiction from mailing labels for existing containers, in addition to ensuring that new containers are properly labeled.</p> <p>The current text reflects stakeholder input during the informal rulemaking period that it would be costly to place labels on all containers. CalRecycle determined that this change would provide jurisdictions with flexibility to implement less burdensome education methods (e.g., labels on new containers) that ensure organic waste is collected and recovered, to support the state's efforts to keep organic waste out of landfills and reduce greenhouse gas emissions. However, nothing in the regulations prohibits a jurisdiction from placing labels on all containers at an earlier time.</p>
6309	Foster, C., City of Oceanside	Article 3 Section 10· This section requires property and business owners to provide adequate containers for organics recycling, education, and access to containers. It fails to require or address the need for property or business owners to ensure	The recommendation is not necessary to achieve the organic waste reduction target and jurisdictions already have the authority to address nuisances.

Comment Number	Received From	Question/Comment	Response(s)
		collection containers are maintained and stored in an area screened from public view and free of public nuisance. Accordingly, the City recommends that Ca/Recycle consider adding language in this section to require property and business owners to screen collection containers from public view, and to maintain collection containers in a manner free of public nuisance, odor, fire, and vermin.	
6310	Foster, C., City of Oceanside	Article 3 Section 11 (a)(2)- This section permits a jurisdiction to provide physical space waivers to commercial businesses and/or property owners. This section is extremely vague, overly burdensome to jurisdictions, and furthermore opens the door to capricious and arbitrary abuse of customers seeking to bypass compliance of this regulation, and ultimately bypass collection fees and services. In coastal cities, like Oceanside, and other older cities across the State of California, jurisdictions constantly face the challenge of accomplishing diversion in areas that lack proper access for storage and servicing of all material streams. To resolve these issues our jurisdiction has taken great steps to incorporate split bin systems, shared servicing systems, and service audit programs, to help business find space in "tight areas". To permit a waiver of this nature and extent, with no specific limitations, and/or oversight by CalRecycle, Cities like Oceanside will face the potential of hundreds, if not thousands of waiver requests, most of which the City would not be permitted to deny. It would also make it very difficult for Oceanside or many cities in general to achieve the high organics diversion goals, that SB 1383 calls for. Accordingly the City recommends Ca/Recycle remove the "Physical Space Waiver" or replace existing language with additional direction on how to determine an appropriate threshold for a waiver, limitations on a waiver, along with direct oversight by Ca/Recycle. For example, if a waiver was permitted by a jurisdiction, that waiver should be reviewed annually by Ca/Recycle, and should ultimately have the potential to be rescinded by Ca/Recycle and the jurisdiction if abuse is suspected, or other options present itself Furthermore, the waiver section should not limit the City's right to charge a fee to cover organics programming services citywide.	It is optional whether jurisdictions grant physical space waivers. They are not required to. Note that jurisdictions also may have more stringent requirements than the proposed regulations
6311	Foster, C., City of Oceanside	Article 3 Section 13 (b)(2)- This section provides for disaster and emergency debris disposal waivers, and further allows for the disposal of all materials, organics included from dams, culverts, reservoirs, and other flood control areas. This section does not specifically state whether a general clean-up or a clean-up of a homeless encampment would qualify for a waiver. Considering the hazardous nature, and the high contamination levels of materials generated from these types of activities, the City is recommending that Ca/Recycle add language to this section that would permit a waiver for the disposal of debris from general clean-ups and homeless encampment clean-ups.	Jurisdictions are not required to separate and recover organic waste removed from homeless encampments. While waste removed from homeless encampments or illegal disposal sites does still count as statewide disposal, the jurisdiction is allowed to dispose of the material and is not subject to enforcement for disposing of the material. As stated in the statement of purpose and necessity for the regulations, specifically Article 3, this regulation does not subject jurisdictions to diversion targets. This regulation cannot alter what activities count as disposal under AB 939.
6312	Foster, C., City of Oceanside	Article 6 Section 6.2(a)(l)- This section requires all biosolids produced at any wastewater treatment plant to be treated via anaerobic digestion and/or composting and sent for land application. Local land application in Southern California is limited, is subject to market forces, and may not always be a viable or	These requirements are to ensure methane reduction. CalRecycle will not be changing these requirements.

Comment Number	Received From	Question/Comment	Response(s)
		<p>optimal option for diversion of biosolids from landfills. In addition to biomass conversion, there are also other end uses employed which appear to be disallowed under this requirement. While the current market forces enable economic land application of biosolids for the City of Oceanside, the City is looking at all options for treated biosolids. Accordingly, the City recommends that Ca/Recycle consider all end uses that divert biosolids from landfill and do not otherwise conflict with the State's Goals. Additionally existing biosolids management practices whereby biosolids do not leave the site should be excluded from these regulations. And emerging technology which may result in energy production (thermal) or avoid fossil-based fuels (cement kilns), but which do not send any biosolids to a landfill should be encouraged.</p>	
6313	Foster, C., City of Oceanside	<p>We recommend all treatment technologies specified in Appendix B of 40 CFR part 503 which result in land application or land reclamation should be counted as a reduction in landfill disposal. Existing biosolids management practices whereby biosolids do not leave the site should be excluded from these regulations. And emerging technology which may result in energy production (thermal) or avoid fossil-based fuels (cement kilns), but which do not send any biosolids to a landfill should be encouraged.</p>	<p>CalRecycle understands the importance of the various pathogen treatment process provided in Appendix B to Part 503. Currently, only biosolids that have been processed by anaerobic digestion or composting have been verified to reduce greenhouse gas emission equivalent to the baseline of 0.30 MTCO<sub>2</sub>e per short ton organic waste processed. Therefore, section 18983.1(b)(6(B) can only consider these technologies when the resulting products are applied to land to ensure the state meets the prescribed emissions reduction target delineated in SB 1383. However, to maintain flexibility to consider additional activities and/or technologies not already verified to minimally meet the baseline, section 18983.2 provides a regulatory pathway for a determination process. Section 18983.2 allows CalRecycle, in consultation with CARB, to make a determination if a project that is not already identified in Section 18983.1(b) can achieve permanent greenhouse gas emissions reductions equivalent to those achieved by composting the same organic waste. Please refer to Section 18983.2 for more information.</p>
6314	Foster, C., City of Oceanside	<p>Article 7 Section 7.(c)(l) - This section requires the jurisdictional approval of haulers, in an effort to ensure haulers are in compliance with the regulation, and are further monitored by the jurisdiction. This section falls short, in that it allows for community composting operations to be exempt from registering or reporting to the jurisdiction. This is contradictory to other requirements throughout the law that require jurisdictions to report on all diversion activities including community composting. It also creates the potential for abuse by community composting, that are actually conducting operations at a large scale, or operations that pose a nuisance or threat to the public health, and/or are in violation to any local franchise operations. Accordingly, the City recommends Ca/Recycle eliminates the blanket exemption for community composting, and further add language that requires community composters to register and provide reporting of operations and generators to jurisdictions at minimum on an annual basis.</p>	<p>Nothing in the cited section allows for community composting operations to be exempt from registering or reporting to the jurisdiction. In addition, any community composting operation must operate lawfully in accordance with all applicable local and state requirements regarding size and throughput. These regulations also do not allow community composting operations to be in violation or any local franchise agreement. Nothing in the regulations prohibits a jurisdiction from having more stringent requirements, such as requiring reporting.</p>
6315	Foster, C., City of Oceanside	<p>Article 10 Section 18991.2, 18991.3, 18991.4 - This section outlines requirements for recordkeeping and reporting by jurisdictions, edible food generators, and edible food recovery organizations. It puts a significant burden on jurisdictions to monitor,</p>	<p>The regulations specify that commercial edible food generators and regulated food recovery organizations and services are subject to inspection, and since an "inspection" is defined in Section 18982(a)(35) to include the review of applicable records, commercial edible food</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>collect information, and report on the activities of both edible food generators and edible food recovery organizations.</p> <p>However, it fails to require adequate recordkeeping and reporting of activities by edible food generators and edible food recovery organizations. Accordingly, the City recommends Ca/Recycle adds language to require that not only records be developed and maintained by edible food generators and edible food recovery organizations, but also provided by request to Jurisdictions, and/or annually to jurisdictions.</p>	<p>generators and regulated food recovery organizations and services must provide jurisdictions with access to the records required under this section upon request by the jurisdiction. A failure to provide such access may be considered a failure to maintain records. Maintenance of and access to the records described in this section is critical for jurisdictions to be able to monitor compliance.</p>
6316	Foster, C., City of Oceanside	<p>Article 12 Section 12.l(f)- This section requires jurisdictions to procure recycled organic waste product but limits those products to compost and renewable natural gas transportation fuel or "RNG". This limitation appears to incentivize RNG over other forms of recycled organic waste product such as renewable electricity produced from biogas. The City currently produces renewable electricity from the biogas produced at City facilities and has recently compared the economics of producing RNG, renewable natural gas for pipeline injection, and biogas for use in a combined heat and power system. The results of that analysis included significant additional costs and/or risk to the City for producing renewable natural gas for either transportation fuel or pipeline injection including but not limited to (1) additional gas cleaning infrastructure, (2) piping infrastructure to the nearest natural gas pipeline, (3) fleet conversions to compressed natural gas, (4) uncertain state and federal subsidies, and (5) market factors. Based on all of these factors, the preliminary recommendation as part of the City's project favored production of electricity from the biogas produced from co-digestion of organic food waste and biosolids. Additionally, the City is aware of research regarding conversion of biogas to other reusable resources such as bioplastics. While these types of efforts are still in the research phase, the current language would add a barrier to development of these types of products. Accordingly, the City recommends that Ca/Recycle consider all forms of recycled organic waste product as meeting this procurement requirement, including but not limited to the generation of electricity from biogas produced from co-digestion of organic food waste and biosolids, renewable natural gas for alternate uses, and byproducts made from the treatment process.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications.</p> <p>CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission's 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 "Renewable Gas" states that renewable gas is not "one size fits all" and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy's Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>
6317	Foster, C., City of Oceanside	<p>Article 12 Section 12.l(f)(l)- This section establishes a procurement requirement for jurisdictions for compost. While the City currently procures compost that meets the intent of this section, the IW2EBMP is evaluating an integrated organic waste/biosolids approach that is likely to include codigestion of organic food waste</p>	<p>The current draft regulatory text considers compost an eligible recovered organic waste product as long as the final product meets the definition of compost, per Section 17896.2(a)(4), and is produced either at a compost operation or facility or large volume in-vessel digestion facility that</p>

Comment Number	Received From	Question/Comment	Response(s)
		<p>and biosolids and co-composting of green waste and the digestate produced from the co-digestion operations to produce a commercially viable product. Article 1 Section 1(a)(12) defines compost as having the same meaning as in Section 17896.2(a)(4). Title 14 CCR Section 17896.2(a)(4) defines compost as "the product resulting from the controlled biological decomposition of organic solid wastes that are source separated from the municipal solid waste stream, or which are separated at a centralized facility." This definition may be interpreted to exclude materials that include biosolids. Under the City's integrated approach, the compost procured would not meet the narrow definition of compost proposed under the rules. The City recommends that CalRecycle amend the definition of Compost to the following: "the product manufactured through the controlled aerobic, biological decomposition of organic waste".</p>	<p>composts on-site (refer to Section 18993.1(f)(1)(A) and (B). Biosolids and/or digestate that do not meet the compost definition will not count towards the procurement target. CalRecycle disagrees with adding any products that include biosolids, that don't meet the above criteria. The broad range of potential products raises the possibility that evaluation on an individual basis would be overly burdensome and would not be transparent to all stakeholders. CalRecycle worked closely with the Air Resources Board to determine the eligibility of the recovered organic waste products in the current regulatory proposal using publicly available pathways and conversion factors</p>
6318	Foster, C., City of Oceanside	<p>Article 12 Section 12.1(f)(2)- This section establishes a procurement requirement by jurisdictions for Renewable Natural Gas transportation fuel. Article 1 Section 1(a)(62) defines Renewable Natural Gas Transportation Fuel as derived " ... from organic waste diverted from a landfill and processed at an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 to recycle organic waste." This definition appears to exclude renewable natural gas transportation fuel which is derived from sewage sludge anaerobic digestion and co-digestion operations, which is likely the result of the City's integrated approach to organic food waste and biosolids. Accordingly, we respectfully request this definition be amended to read: " .... gas derived from organic waste processed in an in-vessel digestion facility that is permitted or otherwise authorized by Title 14 or Title 23."</p>	<p>CalRecycle disagrees with the commenter's argument to allow renewable gas derived solely from sewage sludge to be eligible for procurement. The regulations clarify that only renewable gas derived from organic waste received at a POTW from solid waste facilities may count towards a jurisdiction's procurement target. Other materials digested at a POTW, such as sewage sludge, are ineligible. Renewable gas derived solely from sewage sludge is ineligible for procurement because a POTW is not a solid waste facility and therefore not in the scope of the legislative intent of SB 1383. Sewage sludge is also not typically destined for a landfill, so its use does not help achieve SB 1383's landfill diversion goals. For the reasons noted above, gas generated from the inflows of a sewer system and not from organic waste diverted from the solid waste stream cannot logically be considered a recovered organic waste product. It is inconsistent with the requirements of SB 1383 to incentivize or mandate activities that do not contribute to landfill diversion of organic waste.</p> <p>However, POTWs that accept food waste can technically do so without a solid waste facility permit, they are explicitly authorized to do so per Title 14, making it functionally similar to incentivizing biomethane from a solid waste facility. Therefore it is justifiable to allow the portion of renewable gas resulting from the digestion of food waste that is recovered at POTWs that accept food waste from a facility or operation identified in Section 18993.1(h)(1)(A)-(C) to count toward the procurement targets.</p>
6319	Foster, C., City of Oceanside	<p>Article 12 Section 12.1(f)(2)- We also request that any other beneficial uses of methane be deemed eligible to qualify as fulfilling the procurement obligations. This includes pipeline injection, on-site power production and exported electricity, as well as the production of renewable transportation fuel.</p>	<p>The regulatory proposal provides jurisdictions with flexibility to choose the recovered organic waste products that fit local needs, including various renewable gas options such as transportation fuel, electricity, and heating applications. CalRecycle revised the proposed regulatory text to allow for the use of renewable gas for transportation fuel, electricity, and heating applications. CalRecycle is also allowing electricity from biomass conversion provided that the biomass facility receives feedstock from certain solid waste facilities. The intent is to be consistent with SB 1383 language to support beneficial uses of biomethane derived from solid waste facilities. The changes are necessary to provide more flexibility to jurisdictions in meeting the procurement target with recovered organic waste products in a manner consistent with local needs. Note that pipeline injection is not an eligible procurement option in order to eliminate the potential for double-counting the same gas for</p>

Comment Number	Received From	Question/Comment	Response(s)
			<p>different procurement targets. For example, by including pipeline injection, a jurisdiction(s) could count pipeline injected gas as well as the end use of that gas. The draft regulations do not preclude renewable gas facilities from injecting gas into the pipeline, but the language has been streamlined to clarify that only the end use of that gas (transportation fuel, electricity, heating applications) will be counted towards a jurisdiction’s procurement target.</p> <p>SB 1383 requires state agencies to consider recommendations in the Energy Commission’s 2017 Integrated Energy Policy Report (IEPR) for priority end-uses of renewable gas. Chapter 9 “Renewable Gas” states that renewable gas is not “one size fits all” and the best end-use depends on factors such as feedstock, location, and timing. While the IEPR identified renewable transportation fuel as the most likely near-term, cost-effective solution to maximizing greenhouse gas emissions reduction benefits, it also notes that priority end uses may evolve over time in reaction to state climate change goals, market transformations, and technology advancements. The IEPR supports electricity generation using in-state renewable gas, noting its utility towards meeting the waste reduction requirements and reducing short-lived climate pollutants. The IEPR recognizes that electricity can be more cost-effective than transportation fuel, and specifically mentions the Renewable Portfolio Standard (RPS) and the Bioenergy Market Adjusting Tariff (BioMAT) mechanisms that offer long-term, fixed-price contracts for exporting grid electricity. The proposed end uses also align with recommendations in the SLCP Strategy’s Economic Analysis. While the analysis focuses on transportation fuel via pipeline injection as the highest value use of biomethane generated through organic waste diversion, it also identified barriers such as the economic uncertainty associated with RIN and LCFS prices. The report recommends electricity generation for use on-site and export to the grid as an alternative and potentially more stable revenue stream compared transportation fuel.</p>
6320	Foster, C., City of Oceanside	<p>Sections 17409.5.7, 17896.25.1, 17867, and 20901- These sections require the implementation of a load checking program to prevent the acceptance of prohibited waste. In the near-term, the City of Oceanside intends to perform a pilot study using a bioslurry produced at another facility. The bioslurry to be procured is anticipated to be required to have met certain contamination requirements to ensure minimal impact to the City facilities. The procurement of a bioslurry that is produced at another facility does not appear to be exempted from the load checking requirements, and the facilities that produce the bioslurry will likely have met the regulatory requirements for processing facilities rendering load checking requirements at the in-vessel digester facilities as unnecessary and labor intensive. Accordingly, the City recommends that facilities that procure bioslurry that is produced at another facility be exempted from the load checking requirements.</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations under Section 17409.5.7 in response to comments. The changes replace the number of waste evaluations and frequency of samples that will now be required. This change is necessary to replace the provision with a less burdensome alternative. The waste evaluation changes will reduce the frequency of sampling and reporting requirements. The gray container waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.</p>
6321	Foster, C., City of Oceanside	<p>Sections 17409.5.7, 17896.25.1, 17867, and 20901  Additionally, the City is evaluating the potential for processing raw organic streams into a bioslurry at City facilities. If this option is determined to be feasible, the City is concerned that the proposed rules will require onerous load checking requirements based on discussions with active processors. Accordingly, the City respectfully</p>	<p>CalRecycle has deleted the loadchecking requirements and replaced it with the gray container waste evaluations under Section 17409.5.7 in response to comments. 		request that language be added to enable alternate load checking requirements appropriate for local conditions.	waste evaluations will now only be required at Transfer/Processing operations and facilities that receive a gray container collection stream and more than 500 tons of solid waste from at least one jurisdiction annually will now only have to conduct one waste evaluation per quarter. The change will also allow operators to perform the gray container waste evaluations at an alternative solid waste facility. This is necessary to lessen the burden for operators that have limited space, resources, or finance to conduct the evaluations on-site.
6322	Foster, C., City of Oceanside	Section 17896.44.1- This section requires measurement of organic waste at in-vessel digestion operations. This section does not appear to account for measurement requirements at codigestion facilities, which will need to have separate measurement methodologies prior to digestion and a combined measurement methodology subsequent to digestion. Accordingly, the City respectfully requests that Ca/Recycle add language clarifying the measurement methodology for co-digestion facilities	Publicly Owned Treatment Works (POTW) that receives solid waste that is anaerobically co-digestion with POTW wastewater, pursuant to Section 18896.2, is an excluded activity. Activities that are excluded are not subject to the measurement requirements.
6323	Foster, C., City of Oceanside	Article 13 Section 2- This entire section outlines in overly prescriptive detail the reporting requirements of the entire regulation. Prior comments in this letter have already addressed specific concerns that are to be reiterated as they apply within this section. Much of the reporting burden put on the jurisdiction, generator, and haulers is unreasonable, and not realistic in the reporting timeframes set by Cal Recycle. The reporting requirements of this law alone, are greater than anything we have experienced in our industry, including reporting requirements for AB 939, AB 341, and AB 1826. Accordingly, the City would like to recommend Ca/Recycle reconsider much of its language in this section, and edit the language to mitigate the frequency and prescriptive detail that will only serve to undermine and "set up" jurisdictions good faith efforts to comply and report on activities. The City recommends Ca/Recycle consider jurisdictional proposals for reporting alternatives, annual programmatic summaries, and only if needed, when compliance is of concern, major reporting reviews every three to 5 years versus annually.	A change to the regulatory text is not necessary. Article 13 and 14 are necessary to set the minimum requirements for reporting and recordkeeping by jurisdictions. The reporting information summarizes elements of the Implementation Record and the recordkeeping requirements provide sufficient evidentiary record so the Department can ensure jurisdictional compliance with the chapter.
6324	Foster, C., City of Oceanside	2014 Waste Characterization Table- Please confirm that this Table has been updated to include Biosolids data from 2014, since this serves as the baseline upon which compliance with draft regulations is based.	The 2014 waste characterization was one source of data used to determine the baseline level of organic waste disposal in the year 2014. The 2014 waste characterization study was produced prior to the adoption of SB 1383 in 2016. The waste characterization study is an estimate based on surveys, CalRecycle has not claimed that the study represents an exact or perfect number of organic waste disposal tons that occurred in California in 2014; however, the study represents the most comprehensive estimate of waste disposal for California in 2014. The same study is also relied upon to set targets for AB 1826 which has a 2014 baseline linkage as well. CalRecycle's use of the 2014 study for the 1826 targets was public prior to the adoption of SB 1383. There is no evidence that the Legislature intended that CalRecycle take a different course and disregard the body of evidence compiled in the waste characterization study. However, CalRecycle did not solely rely upon the waste characterization study. CalRecycle supplemented the waste characterization study data with data from the Disposal Reporting System (now the Recycling Disposal and Reporting System) regarding disposal of organic waste as alternative daily cover (ADC) or alternative intermediate cover (AIC). CalRecycle additionally relied

Comment Number	Received From	Question/Comment	Response(s)
			upon data provided by the wastewater industry regarding the disposal of biosolids including the disposal of biosolids as ADC and AIC.
3301	Fox, D., City of Diamond Bar	Infrastructure Capacity: California lacks sufficient capacity today to be able to meet the needs for new organic waste processing. Many cities have expressed concern over an ability to comply with organic waste diversion requirements due to a lack of waste disposal infrastructure. There is an uneven distribution of waste disposal infrastructure, such as bio-digesters, across the state. Moreover, where the infrastructure does exist, capacity is limited. While the regulation provides five years to implement programs, cities are concerned that this is not sufficient time to develop and permit new facilities.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
3302	Fox, D., City of Diamond Bar	Funding: Lack of sufficient funds continues to be among the major challenges local governments face in the effort to implement new organic waste diversion programs. The City of Diamond Bar and other communities continue to seek solutions to address the need for substantial public sector funding. Local governments, like ours, continue to work to address the need for funds to undertake prescribed activities, such as funding household hazardous waste programs to prevent contamination of recyclables, and funding for targeted educational programs to help share knowledge about sustainable living.	Comment noted. The Legislature mandated ambitious organic waste diversion targets in SB 1383 on a short timeline and the Department acknowledges that infrastructure to handle the diversion of this material is key to achieving those legislative mandates. The Department has included provisions in the proposed regulations allowing for delayed enforcement in cases where extenuating circumstances beyond the control of a jurisdiction, such as deficiencies in organic waste recycling infrastructure or delays in obtaining discretionary permits or governmental approvals, make compliance with the regulations impracticable. The Legislature in SB 1383 furthermore authorizes local jurisdictions to charge and collect fees to offset the cost of complying with the proposed regulations. Regarding environmental issues regarding expected infrastructure expansion, those issues were addressed in the Environmental Impact Report that was prepared and certified by the Department for this rulemaking, and was subject to public comment, pursuant to the requirements of the California Environmental Quality Act (CEQA). CalRecycle acknowledges that the proposed regulations will require regulated entities to invest in actions and programs that will reduce pollution and protect the environment. The timelines were established in the statute and the regulations are necessarily designed to impose requirements in a manner that is in alignment with the ambitious statutory timelines. The legislation did not provide a dedicated source of state funding to fund compliance with the regulations but did provide a specific allowance for local jurisdictions to charge fees to offset their costs of complying.
3303	Fox, D., City of Diamond Bar	Penalties: The penalties outlined in these regulations are premature. If the purpose of penalties is to ensure generators are sufficiently deterred from non-compliance, this regulation puts the cart before the horse by designing penalties before the sticking points and needs of generators are understood. We encourage CalRecycle	A change to the regulatory text is not necessary. The legislature specifically authorizes CalRecycle's to develop regulations that "require local jurisdictions to impose requirements on generators or other relevant entities within their jurisdiction and may authorize local jurisdictions to impose penalties on generators for noncompliance." Also, the statute states the regulations

Comment Number	Received From	Question/Comment	Response(s)
		to continue working through the programmatic scheme before implementing an appropriate set of penalties, particularly since programs have until 2022 to be implemented. We ask that CalRecycle adopt penalties in a second set of regulations to take effect at a future date.	“may include penalties to be imposed by the Department.” This text clearly authorizes CalRecycle to adopt regulations that require specified action from jurisdictions, including regulations the require jurisdictions to impose requirements on entities subject to their jurisdiction. This approach mirrors CalRecycle's delegated enforcement approach for waste tire hauler oversight and solid waste facility oversight, where primary oversight is conducted at the local level (typically by county offices of environmental health) with CalRecycle concurrence. Programs that have enforcement generally see a higher rate of compliance than programs that do not have enforcement. The success of the Short-Lived Climate Pollutant Strategy relies on achieving significant reductions in landfill disposal of organic waste by 2020 and 2025. Delaying enforcement would impede California's goal of achieving these targets.
3304	Fox, D., City of Diamond Bar	Procurement: New procurement requirements in these proposed regulations require local governments to purchase recovered organic waste products targets set by CalRecycle. We anticipate these requirements will result in substantial additional costs to local governments, over and above the costs we already anticipate to comply with the extensive programmatic requirements of the proposed regulations. We ask that CalRecycle instead work to develop markets for such materials in a second regulatory proceeding.	A change to the regulatory text is not necessary. The draft regulatory proposal is designed to provide flexibility to jurisdictions in procuring the recovered organic waste product(s) that best fit local needs. Many jurisdictions already procure these products, or their equivalent forms, and this requirement should not result in “substantial additional costs”. CalRecycle disagrees with the suggestion to hold a subsequent rulemaking. If the state is to achieve the ambitious landfill diversion targets required by SB 1383, it would be detrimental to delay the much-needed organics diversion that these procurement regulations are designed to encourage. CalRecycle notes that the regulations do not even take effect until two years after the date the first target is supposed to be achieved. However, CalRecycle recognizes the significant effort and resources needed for program implementation, which is why the rulemaking process has been ongoing since 2017. Although the regulations will not take effect until 2022, adopting them in early 2020 allows regulated entities approximately two years to plan and implement necessary budgetary, contractual, and other programmatic changes. In other words, it is an opportunity for jurisdictions to phase-in compliance. Jurisdictions should consider taking actions to implement programs to be in compliance with the regulations on January 1, 2022.
3305	Fox, D., City of Diamond Bar	Constitutionality of Fees: CalRecycle should not rely on the fee authority granted to local jurisdictions in SB 1383. Any fee that a city attempted to impose to fund the additional costs of these regulations would likely be treated as a tax under Cal. Const. Art. XIII C, sec. 1 (e) (Prop. 26) as it would not meet any of the exceptions identified in that section. Further, even were a fee to survive scrutiny under Prop. 26, it is questionable whether a city would not have the authority to impose the fee without first complying with the majority protest procedures of Cal. Const. Art. XIII D, sec. 6 (Prop. 218.) This latter concern is currently the subject of litigation in the Third District Court of Appeal (Paradise Irrigation District v. Commission on State Mandates, Case No. C081929).	CalRecycle disagrees with the characterization of procurement requirements as an unfunded mandate. First, the Legislature, in SB 1383, explicitly authorized local jurisdictions to charge and collect fees to recover its costs incurred in complying with the regulations (Pub. Res. Code § 42652.5(b)). In addition, Section 7 of the bill states that, “No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because a local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the program or level of service mandated by this act, within the meaning of Section 17556 of the Government Code.” Such a fee authorization, and costs being recoverable from sources other than taxes, overcomes any requirement for state subvention of funds for reimbursement for a state mandate (see Gov. Code § 17556, County of Fresno v. State of California, 53 Cal.3d 482 (1991)). Second, local jurisdictions have discretion to design legitimate regulatory fees that charge, collect, and use funds in a manner that meets the exceptions to the definition of a “tax” under Cal. Const. Art. XIII C, Section 1 (e). There are no provisions in the SB 1383 regulations that limit that discretion. As such, it is overbroad and speculative to describe “any fees” that may in the future be imposed by the numerous local jurisdictions in California as “likely” to be treated as taxes. If a

Comment Number	Received From	Question/Comment	Response(s)
			<p>fee were to be challenged, the determination would be highly dependent on the particulars of how a local charge is purposed, collected and used. CalRecycle is not aware of any facts indicating that local jurisdictions are outright prevented from designing valid regulatory fees consistent with Prop. 26 and Prop. 218 to offset the costs of complying with SB 1383.</p> <p>According to the October 1, 2018 decision in Paradise Irrigation Dist. v. Commission on State Mandates, a statutory authorization to levy fees, such as that provided in SB 1383, is the relevant and dispositive factor in overcoming claims of subvention for a state mandate. This is true whether or not a local fee is subject to, or defeated by, a majority protest procedure. The court found the protest procedure to be a practical consideration for a local government as opposed to a legal factor in determining a requirement for subvention for a state mandate.</p> <p>Finally, it should be recognized that the procurement requirements are designed to apply to existing needs for a jurisdiction, such as for paper products, compost and mulch, and fuel for transport, heating and electricity, and require jurisdictions to instead purchase that material in a form derived from recovered organic waste. Thus, it is not designed to mandate new purchases but instead to make existing needs purchased from an alternate source.</p>
2030	Gardner, Janet; Fresno	At least one jurisdiction is pushing these requirements to the haulers to do the inspections of the hauler customers and report back to the jurisdiction. Thereby putting a huge burden on haulers and/or processors to act as enforcement officers. It appears SB 1383 compliance and enforcement measures are not realistic, verifiable, and consistent or equitable for all communities.	Pursuant to Section 18981.2, any designation of a public or private entity to carry out a jurisdiction's responsibilities under Chapter 12 would need to be pursuant to a contract or MOU. As such, a designation would be subject to a negotiated agreement and a potential designee cannot be forced into accepting a designation.
2031	Gardner, Janet; Fresno	Do customers have the option of refusing entry for the purpose of inspections? Would a court consider issuing an inspection warrant for this type of inspection? There are so many unintended consequences of implementation and enforcement.	CalRecycle added section 18984.10(c)(1) which states it is not intended to permit an employee or agent of the Department or a jurisdiction to enter the interior or a private residential property.
3635	Geyer, M., Kern County Solid Waste Management Advisory Committee LTF	On behalf of the governing jurisdiction(s), business enterprises, and the citizens of Kern County, this Committee has found that the SB 1383 regulations will result in hardships on all parties related to the upfront cost, the competitive viability of organic end use products, increased monitoring and reporting, cross-jurisdictional contamination, and the general intrusive nature that will be placed upon our businesses and citizens.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.
3636	Geyer, M., Kern County Solid Waste Management Advisory Committee LTF	This committee is concerned that the overall nature of this Senate Bill has been derived from a theoretical model that has not been vetted in the real world and will not have a successful practical application and the jurisdictions, businesses, and citizens will be left with the fallout. Therefore, the Kern County Solid Waste Management Advisory Committee and Local Task Force, in good faith, cannot support SB 1383, as presented.	Comment noted. The commenter is expressing an opinion regarding the authorizing statute rather than the regulations or regulatory process.
3637	Geyer, M., Kern County Solid Waste Management Advisory Committee LTF	For these reasons, we urge you to reconsider many of the proposed components of SB 1383 and take a more flexible approach on timelines, specified scientific parameters, and the penal nature of the bill. It is our deepest hope that many of the submitted comments are adhered to and those facets of the bill are changed accordingly.	Comment noted. The commenter is expressing an opinion regarding the overall regulatory model used by CalRecycle. CalRecycle has determined this model is necessary to achieve the ambitious organic waste diversion mandate in statute.

3071	Geyer, M., Kerntec Industries, Inc.	<p>In summary, the regulations, as written, will subject California’s public to unabridged unwarranted health hazards that are broad and real, including:</p> <ul style="list-style-type: none"> <li>• Putrescible “prohibited” food wastes will result in harmful residues in the compost,</li> <li>• Harmful human pathogens will be present in the compost,</li> <li>• Containers holding putrescible food waste will be a breeding-ground for pathogens,</li> <li>• Rotting putrescible food waste, in containers, will attract vectors,</li> <li>• Waste containers that stink and attract vectors will lead to conflict and disputes,</li> <li>• Food-waste containers will need frequent cleaning with corrosive chemicals, and</li> <li>• Composting facilities expose the public living and working downwind from these facilities to alarming concentrations of odors, bioaerosols, and particulate matter.</li> </ul> <p>It is negligent to think that mandatory composting food wastes will significantly improve public health in California. Public health should be a primary Dept. consideration given real hazards ... not theoretical, un-proven hazards associated with methane emissions and global warming.</p> <p>NOTE: This is a 4 page letter with one comment. I only included the summary here...</p>	<p>Comment noted. The regulations are designed to achieve the specific purpose of the statute. The comment does not recommend any specific regulatory change but references potential health and safety issues that the regulations already addresses.</p>
3072	Geyer, M., Kerntec Industries, Inc.	<p>In my opinion, the foundation for these rules is NOT supported by the US-EPA. As I understand it, the Dept. is mandating physical separation and then composting putrescible food waste with the intent of preventing landfill disposal, for the purpose of reducing generation of landfill gas (which contains 40 to 60% methane), to achieve greenhouse gas emissions reductions; because, as the Dept. believes, methane emissions from California’s landfill contribute significantly to global warming and climate change.</p> <p>My position (opposing these regulations) is supported by the U.S. Environmental Protection Agency’s (US-EPA) Landfill Methane Outreach Program (LMOP). Based on US-EPA LMOP facts:</p> <ul style="list-style-type: none"> <li>• Using landfill gas to generate energy and reduce methane emissions produces positive outcomes for local communities and the environment.</li> <li>• The benefits of landfill gas energy projects are significant for the following reasons: <ul style="list-style-type: none"> <li>o Reduce greenhouse gas emissions,</li> <li>o Reduce air pollution by offsetting the use of non-renewable resources,</li> <li>o Create health and safety benefits,</li> <li>o Benefit the community and economy, and</li> <li>o Reduce environmental compliance costs.</li> </ul> </li> <li>• Landfill gas energy projects capture between 60 and 90% of the methane emitted from a landfill.</li> <li>• CO2 emissions from municipal solid waste landfills are not considered to contribute to global climate change.</li> </ul>	<p>Commenter is expressing an opinion regarding the scope of the proposed regulations. However, the diversion of organic waste from landfill disposal is a statutory mandate as opposed to a discretionary decision by CalRecycle.</p>

Comment Number	Received From	Question/Comment	Response(s)
		<ul style="list-style-type: none"> <li>• Energy produced from landfill gas offsets the use of non-renewable resources, such as coal, oil or natural gas.</li> <li>• Landfill gas energy recovery gives communities and landfill owners the opportunity to reduce costs associated with regulatory compliance by turning landfill gas into a valuable community resource.</li> </ul> <p>( Reference: <a href="https://www.epa.gov/lmop/benefits-landfill-gas-energy-projects">https://www.epa.gov/lmop/benefits-landfill-gas-energy-projects</a> )  All of the above stated facts, by the US-EPA, are in stark contradiction to the Dept.'s Policy Statement Overview; which describes methane emitted from landfills to be significant contributors of global warming and climate change – a theoretical assumption at best.  I am appalled, because the Dept. has the authority, and duty, to provide for the protection of public health, and these rules don't. Moreover, the Dept. admits that these rules will result in a \$17.4 Billion dollar hit to California's economy. The Dept.'s analysis of public health benefits is dubious and weak. The Dept.'s analysis of the cost to California's is alarming; given a weak association of theoretical benefits. These rules are unwarranted and unjustified given facts provided by the US-EPA's LMOP program; which has been developed with over 20-years of landfill research and findings.</p>	
2004	Gilbert, Jennifer; City of Davis Public Works	The flexible waste container options showed in the SB 1383 presentation did not show a split recycling cart where both sides of the cart collect only recycling (paper on one side, glass, plastic and metals on another side). Are split recycling carts allowed under the proposed regulations?	A change to the regulatory text is not necessary because split carts already are allowed.
