## Table of Contents

Table of Tables ..... iv
Table of Figures ..... viii
Acknowledgments ..... xi
Executive Summary ..... 1
Summary of Objectives ..... 1
Summary of Approach ..... 1
Summary of Findings ..... 3
Introduction and Overview ..... 19
Objectives of the Study ..... 20
Contributing Consultants ..... 20
Material Streams ..... 21
Explanation of Tasks ..... 21
Industry Groups ..... 22
Sample Allocations ..... 24
Summary of Methods ..... 27
Selection and Recruitment Process ..... 27
Site Visits ..... 30
Study Results ..... 34
Rate and Density Findings ..... 35
Notes for the Composition and Quantity Findings ..... 45
Findings for the Overall Commercial Sector ..... 47
Findings for Arts, Entertainment, \& Recreation ..... 52
Findings for Durable Wholesale \& Trucking ..... 57
Findings for Education ..... 62
Findings for Hotels \& Lodging ..... 67
Findings for Manufacturing - Electronic Equipment ..... 72
Findings for Manufacturing - Food \& Nondurable Wholesale ..... 77
Findings for Manufacturing - All Other ..... 82
Findings for Medical \& Health. ..... 87
Findings for Public Administration ..... 92
Findings for Restaurants ..... 97
Findings for Retail Trade - Food \& Beverage Stores ..... 102
Findings for Retail Trade - All Other ..... 107
Findings for Services - Management, Administrative, Support, \& Social ..... 112
Findings for Services - Professional, Technical, \& Financial ..... 117
Findings for Services - Repair \& Personal ..... 122
Findings for Not Elsewhere Classified ..... 127
Findings for Multi-Family ..... 132
Additional Analyses Results ..... 137
Task 3 Analysis - Assessment of Commercial Curbside Diversion ..... 137
Recruitment Survey Questions ..... 146
Weight-Based Disposal Rate Study ..... 147
Summary of Methods ..... 147
Appendix A: Detailed Methodology ..... 151
Overview ..... 153
Industry Groups and Regions Included. ..... 154
Sample Allocations ..... 162
Comparison of Task Methodologies ..... 166
Recruitment ..... 167
Node Recruitment ..... 167
Generator Site Recruitment ..... 170
Field Sampling/Sorting ..... 179
General Design Elements ..... 179
Scheduling Site Visits ..... 180
Sample Collection ..... 182
Sorting Procedures ..... 184
Contingency Measures ..... 185
Data Forms ..... 186
Approach to Coordination ..... 187
Data Management Plan ..... 187
Quality Assessment/Quality Control ..... 188
Analysis ..... 189
Appendix B: Material Definitions ..... 191
Mapping the Material Types to the Compact List Used for Reporting ..... 193
Material Definitions ..... 196
Material Type Examples ..... 208
Recoverability Groups ..... 210
Contamination Subsort Definitions ..... 212
Material Groupings for Task 3 Analysis ..... 213
Appendix C: Description of Calculations. ..... 215
Calculating the Waste Stream Quantities ..... 217
Calculating the Waste Stream Compositions ..... 225
Calculating Waste Generation ..... 231
Special Note for Task 3 Analysis ..... 233
Appendix D: Field Forms ..... 237
Node Recruitment ..... 239
Business Recruitment ..... 246
Multi-Family Recruitment ..... 257
Field Data Collection Forms ..... 267
Appendix E: Detailed Composition Tables ..... 279
Means and Error Ranges ..... 281
Infrequent Material Types ..... 281
Appendix F: Other Analysis Tables ..... 355
Appendix G: Recommendations for Future Studies ..... 363
Appendix H: Health and Safety Plan ..... 367

## Acknowledgments

This study would not have been possible without the cooperation and assistance of solid waste management companies, waste haulers, and business and venue owners or operators throughout the state of California who generously agreed to participate in this effort, and the solid waste facilities that served as the research team's base for sorting the waste samples:

- San Francisco Solid Waste Transfer and Recycling Center. San Francisco, CA
- Zanker Road Landfill, San Jose, CA
- Hawthorne St. Transfer Station, Eureka, CA
- Lovelace Transfer Station, Manteca, CA
- Landers Sanitary Landfill, Landers, CA
- Golden Bear Waste Recycling Center, Richmond, CA
- Sun St. Transfer Station, Salinas, CA
- Paloma Transfer Station, Paloma, CA
- Chiquita Canyon Sanitary Landfill, Castaic, CA
- KWRA Material Recovery Facility, Hanford, CA
- Potrero Hills Landfill, Suisun City, CA
- Monterey Peninsula Landfill, Monterey, CA
- Pinecrest Transfer Station, Pinecrest, CA
- West Miramar Sanitary Landfill, San Diego, CA
- City of Clovis Landfill, Fresno, CA
- Central Transfer Station, Petaluma, CA
- MarBorg C\&D Recycling \& Transfer Facility, Santa Barbara, CA
- Calabasas Sanitary Landfill Agoura Hills, CA
- City of Redding Transfer Station/MRF, Redding, CA

The cooperation of the businesses and venues that participated in this study is very much appreciated. They unselfishly volunteered their time and resources to assist us with this project.

## Executive Summary

## Summary of Objectives

In 2011, California set an ambitious goal of 75 percent recycling, composting, or source reduction of solid waste by 2020. In 2006, California set ambitious goals to reduce greenhouse gas emissions. Directing waste materials that are generated in the state away from disposal and back into the economic stream, to their best and highest use, helps reach these goals. Businesses in California have diverted waste in many ways for many years and will continue to play a critical role in reaching these goals. The objective of this waste characterization project was to provide a better understanding of how discarded materials are generated, disposed, and diverted by the commercial sector, both for individual industry groups and for the commercial sector as a whole. This can help businesses, local governments, and CalRecycle better direct efforts to increase diversion and reduce disposal.
The California Department of Resources Recycling and Recovery (CalRecycle) commissioned this project to conduct an in-depth study of waste generated by California businesses. The objectives of the project were:

- To quantify what materials are generated and in what amounts. This includes all discards-both those disposed and those diverted from disposal.
- To characterize the sources of materials and to determine what materials are generated by different types of businesses, since they generate them in different ways (for example, compare restaurants to banks).
- To identify the paths or streams the discarded materials take, whether they are placed in disposal bins, recycling bins, or organics bins, or diverted though other means (such as a manufacturer selling scrap metal).

This study was accomplished by characterizing and quantifying disposal and diversion from individual commercial and multi-family generators statewide. CalRecycle conducted similar generator studies as part of the 1999 Statewide Waste Characterization Study and the 2006 Waste Disposal and Diversion Findings for Selected Industry Groups. The results of the present study provide CaIRecycle with updated information about disposal and diversion activities among commercial and multi-family generators statewide and by industry group.

## Summary of Approach

A total of 837 unique commercial generator sites and 52 unique multi-family generator sites participated in the study. Sites were recruited from the five regions of the state designed for this study: Bay Area, Coastal, Mountain, Southern, and Central Valley. Sampling occurred during four seasons in 2014. Recruitment staff gathered data from each participating site to (1) determine how to arrange and conduct visits for data collection purposes, (2) quantify and characterize disposal and diversion, and (3) correlate disposal and diversion information with other information about the generator
(such as number of employees, participation in recycling programs, number of visitors, etc.).
The study included the following 16 industry groups, as well as multi-family complexes:

- Arts, Entertainment, \& Recreation
- Durable Wholesale \& Trucking
- Education
- Hotels \& Lodging
- Manufacturing - Electronic Equipment
- Manufacturing - Food \& Nondurable Wholesale
- Manufacturing - All Other
- Medical \& Health
- Public Administration
- Restaurants
- Retail Trade - Food \& Beverage Stores
- Retail Trade - All Other
- Services - Management, Administrative, Support, \& Social
- Services - Professional, Technical, \& Financial
- Services - Repair \& Personal
- Not Elsewhere Classified

Industry groups were designed according to several factors: grouping business types with similar waste generation profiles and purposes; focusing on industries that generate large amounts of organics; focusing on industries with high employment in California; combining industries with less employment or fewer diversion opportunities into a final group; and project budget. The construction industry group was not included in this study because waste associated with this industry is mainly generated at building sites rather than the site of the business office. Waste disposed from construction activities and sites was characterized in a separate CalRecycle study titled California 2014 Waste Characterization Study.

Disposed waste was characterized by obtaining one 200-pound sample from each disposal stream at each site and hand-sorting it into 82 material categories. Diverted materials were characterized by obtaining one sample of up to 125 pounds from each diversion stream at each site and characterizing it according to the same 82 material categories used for disposal samples. Disposal and diversion were quantified through
measurements of material accumulation in dumpsters, interviews with staff, examination of disposal and diversion records, and inspection of recycling and diversion systems during on-site visits. Generation rates for disposal and diversion streams were determined on a per employee basis for businesses and per occupied unit for multifamily complexes.

## Summary of Findings

For the overall commercial sector, findings are presented in three ways:

- First, an overview of the quantity generated in each material stream: Disposed, Curbside Recycle, Curbside Organics, and Other Diversion.
- Second, a breakdown of the composition of materials in each stream, according to potential recoverability.
- Third, a summary of the total generation by recoverability group. This includes materials that were diverted as well as divertible materials that were placed in the Disposed stream.

Several additional tables and figures follow the overall commercial sector summaries. These additional tables and figures include:

- A summary of total generation for each group, broken down by stream.
- An overview of the generation rate and diversion rate for each industry group.
- Key metrics for each group, including the three most prevalent divertible materials.

## Key Findings for the Overall Commercial Sector

Figure 1 presents the annual tons for each material stream in the overall commercial sector. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams, such as food in recycling bins or glass in organics bins. As shown, almost two-thirds of the material generated at businesses went to the Disposed stream, while the remaining one-third was in the diversion streams.

Figure 1. Annual Tons by Waste Stream: Overall Commercial Sector

Note: Numbers may not total exactly due to rounding.

The 82 material types included in the study were aggregated into five recoverability groups: Curbside Recyclable, Compost/Mulch, Other Recyclable, Recoverable Inerts, and Other Materials. Materials were classified based on whether they were commonly accepted in curbside recycling programs; commonly used for compost or mulch; generally recyclable through other means (such as electronic waste or textiles); recoverable through construction and demolition programs (inerts such as concrete and asphalt), or not usually recovered. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Each material stream was composed of many different material types and each of those material types was assigned to one of the five recoverability groups. Figure 2 breaks down the potential recoverability (by recoverability group) for each stream in the overall commercial sector. As shown, Compost/Mulch accounted for almost half of the Disposed stream. The Other Diversion stream was nearly evenly split among Curbside Recyclable, Compost/Mulch, and Other Recyclable materials. Figure 2 illustrates that recyclable materials were found in the Disposed stream and that materials not usually recovered ("Other Materials") were indeed recovered by some businesses. In fact, materials of all recoverability types were found in all streams.

Figure 2. Recoverability by Stream: Overall Commercial Sector

Figure 3 summarizes each recoverability group's proportion of total generation, based on the types of materials, regardless of which stream they were found in. Each bar includes materials both diverted and disposed. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 3 illustrates, approximately 43 percent of total generation in the overall commercial sector was material in the Compost/Mulch recoverability group, and approximately 25 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 81 percent of the overall commercial sector generation.

Figure 3. Recoverability of Materials Generated in the Overall Commercial Sector
Percentage reflects the proportion of overall commercial sector generation

Taken together, Figures 1, 2, and 3 show that a large part of the discards generated by the commercial sector are recoverable, and there is significant potential to increase diversion of these materials from disposal. The remainder of this report provides details on the commercial waste stream to help understand industry sources for both disposed and recovered materials.

## Key Findings for Industry Groups

Businesses generate waste in different ways-for example, restaurants and banks generate different types of materials. A business' waste generation pattern, its waste management practices, and the prevalence of that business type in California have an influence on the overall commercial sector waste stream. This section highlights key findings for several of the largest industry groups.

- The Services-Professional, Technical, and Financial group accounted for approximately 19 percent of overall commercial sector generation, making it the largest generator in the state. This group also employs the most people in California. Examples of business types in this group include banks, real estate agencies, architecture firms, and engineering companies. The majority of generation in this group is in the Disposed stream: materials that are disposed directly from the businesses without further significant recovery.
- At nearly 14 percent of overall generation, Restaurants is the second-largest industry group in the study. For Restaurants, the largest portion of the material generated went to the Disposed waste stream. Although more restaurants are participating in food diversion programs, food is the most prevalent divertible material type in the Restaurants' disposed waste.
- Services-Management, Administrative, Social, and Support and Retail TradeAll Other are the only other groups to generate more than 10 percent of the overall commercial sector waste. These two groups have very different total generation composition profiles. Nearly 90 percent of the material generated by the "Retail Trade-All Other category went to the Disposed stream, but that proportion was approximately 52 percent in the Services-Management, Administrative, Social and Support group.
- Manufacturing-Electronic Equipment accounted for less than 1 percent of the overall commercial sector generation, making it the smallest group (by generation) in the state. Manufacturing-Electronic Equipment includes businesses manufacturing physical goods such as computers, radios, computing and memory chips, transformers, electrical appliances, and batteries, but it does not include software developers.

Figure 4 summarizes the annual generation by material stream for each industry group and the multi-family group. The percentages reflect that group's proportion of total commercial sector generation (nearly 26 million tons), excluding the multi-family group.

Figure 4. Annual Generation for Industry Groups, by Stream

The industry groups addressed by this study that achieve the highest diversion rates do so mainly by implementing effective programs to divert corrugated cardboard boxes, scrap metal, food and other organics, or pallets. Of the groups addressed in this study, Durable Wholesale and Trucking and Retail-Food and Beverage Stores have the highest diversion rates. Businesses in these groups divert 80 percent and 82 percent of their total generation, respectively. These groups achieve the vast majority of their diversion outside the normal curbside collection programs, primarily through backhauling pallets for reuse, directly selling their baled cardboard and scrap metal, or selfhauling their compostable materials to organics processors.

The Education and Multi-Family industry groups each divert an estimated 15 percent of their generation. Retail Trade-All Other and Medical and Health businesses have the lowest diversion rates, at 11 percent and 9 percent respectively.
The generation and diversion rate information, on a per employee basis, is summarized in Table 1.

Table 1. Generation Rate Summary by Weight, by Group (TPEPY)

|  | Tons per Employee per Year |  |  |  |  |  |

| Not Elsewhere <br> 16 Classified | 0.50 | 0.05 | 0.01 | 0.64 | 1.20 | 58\% |
| 17 Multifamily* | 0.74 | 0.13 | 0.00 |  | 0.87 | 15\% |

*Multifamily is reported in tons per unit per year

Based on the field data collection, key findings for each industry group are presented below in Table 2 through Table 19. These key findings include disposed tons per employee per year (TPEPY), diverted TPEPY, disposed tons, diverted tons, diversion rate, and the three most prevalent divertible materials (by weight) in the Disposed stream.

In general, compostable materials such as food, leaves and grass, and lower-grade compostable papers present an opportunity to greatly increase diversion for most of the industry groups. Recyclable papers such as cardboard and mixed paper also show significant potential for further recycling, as does lumber, for several industry groups.

## Additional Analysis - Assessment of Commercial Curbside Diversion

In 2012, California's Mandatory Commercial Recycling (MCR) law went into effect, requiring businesses to take actions to divert materials from disposal. Businesses can comply by source-separating materials and having them delivered for recycling or composting. They can also comply by subscribing to a service that may include mixedwaste processing (i.e., recyclables are not separated and the entire waste stream is processed), as long as the results are comparable to source separation. In order to determine what's comparable to source separation, an assessment of that source separation is needed. This part of the study provides one assessment of source separation.

This special analysis aimed to assess the performance of curbside programs by focusing on curbside diversion by businesses and multi-family sites. Curbside programs capture the materials that would be processed by a "clean" material recovery facility (MRF) or an organics processing facility. The generator sites used for this task were a subset of those used for the whole study. They were selected to represent the make-up of California's overall commercial and multi-family sector as a whole, not by industry group. To be included, the business site must have curbside recycling and/or organics service. Since the Mandatory Commercial Recycling law includes multi-family sites, the multi-family sector was included in the analysis. The analysis excluded Other Diversion-the items diverted through other methods such as back-hauling, selfhauling, take-back programs, and other means.

For this analysis the field crew performed a more detailed sort of Disposed, Curbside Recycle, and Curbside Organics samples from the subset of generators selected to participate in this part of the study. The field crew collected additional details on the level and the source of contamination for certain materials in these samples. The purpose of the contamination subsort was to estimate the fraction of the sorted materials that a MRF or organics processor could recover, recognizing some "recoverable" material arriving at a facility is too contaminated to be recovered.

As shown in Table 20, approximately 21 percent of the material placed in bins at businesses and multi-family complexes is recovered through curbside diversion programs capturing the standard recoverable materials.

*These materials were not subsorted for contamination. All glass containers, food, leave and grass, and prunings and trimmings are assumed to be recovered if in the appropriate bin.
**These are materials that are not typically recoverable and most of these materials were not subsorted for contamination.

## Introduction and Overview

The California Department of Resources Recycling and Recovery (CalRecycle) commissioned this study of commercial and multi-family waste generators to quantify and characterize material that was disposed or diverted by representative members of key industry groups. The resulting data provided CalRecycle with information about disposal and diversion activities among commercial and multi-family generators as a whole and by industry group. The industry group data provided information on sources of materials disposed and diverted by businesses and can help businesses, local governments, and CalRecycle better direct efforts to increase diversion and reduce disposal.

This study is part of a larger project that also included a disposal facility-based waste characterization study. The entire project consisted of four main tasks:

- Task 1: A comprehensive statewide characterization of materials disposed in California's waste stream, from residential, commercial, and self-hauled sectors, using disposal facility-based sampling. The results of this study are reported separately in 2014 Disposal-Facility-Based Characterization of Solid Waste in California.
- Task 2: A characterization of materials disposed from industry groups, and the commercial sector as a whole, using generator-based sampling.
- Task 3: An assessment of recovery of materials from commercial sourceseparation systems, using generator-based sampling (using data collected from Task 2 and Task 4).
- Task 4: A characterization of materials diverted from industry groups, and the commercial sector as a whole, using generator-based sampling.

The results of Tasks 2, 3, and 4 are reported here. These tasks are described further in Appendix A: Detailed Methodology.

CalRecycle conducted similar generator studies as part of the 1999 Statewide Waste Characterization Study and the 2006 Waste Disposal and Diversion Findings for Selected Industry Groups. The results from this study are not directly comparable with those previous studies due to changes in the methodology. Industry groups in the previous studies were based on Standard Industrial Classification (SIC) business codes; however, this study uses the current system, the North American Industrial Classification System (NAICS) business codes, to group businesses. The number of industry groups, and the types of businesses included in those industry groups, is different than in previous studies. Perhaps the biggest difference is in the number of material streams included. The 1999 study focused exclusively on the disposed stream, while the 2006 study included both disposal and a more limited characterization and quantification of the diversion streams than this study. This study included detailed
sorting of materials in curbside recycling and curbside organics bins as well as quantification of materials diverted through other means.

## Objectives of the Study

The objective of this study was to develop representative disposal and diversion composition, quantity, and rate data for key industry groups and for the multi-family sector. The rate data is presented as tons per employee per year (TPEPY) for businesses and as tons per occupied unit per year (TPUPY) for multi-family sites. This study included the entire commercial sector, divided into 16 industry groups, as well as multi-family properties. This study was completed using a carefully designed sequence of field sampling, sorting, and quantification activities involving interviews and visits with representative commercial establishments and multi-family properties. The resulting data provides a complete picture of waste generated by commercial and multi-family generators, as well as information on the types of diversion activities occurring in the business sectors and multi-family sites included in the study. CalRecycle will use the data from the study to update its waste characterization database.

## Contributing Consultants

This study was managed by Cascadia Consulting Group, Inc., an environmental consulting firm based in Seattle, Washington. It relied on data collection activities conducted by Sky Valley Associates and L2 Environmental. The distribution of responsibilities was as follows:

- Cascadia Consulting Group, Inc.
- Project management
- Study design
- Coordination of business site recruitment
- Coordination of data collection
- Data entry and analysis
- Reporting
- Sky Valley Associates
- Collection, characterization, and quantification of disposed waste
- L2 Environmental
- Collection, characterization, and quantification of diverted material

The consultants provided training to CalRecycle staff in the recruitment and field data collection procedures. CaIRecycle staff assisted with the facility recruitment and some sample site recruitment. For the purposes of this study, we will refer to any of the parties mentioned here as "the project team."

## Material Streams

Text, tables, and figures throughout this report refer to the four waste streams included in the study: Disposed, Curbside Recycle, Curbside Organics, and Other Diversion. Each of those streams is defined as follows.

Disposed - materials headed to a landfill (either directly or indirectly via transfer station) with no further processing. May be collected by a third party or selfhauled.

Curbside Recycle - non-putrescible materials hauled by a contracted third party to a material recovery facility (MRF) that receives source-separated recyclable materials (i.e., "clean MRF").

Curbside Organics - putrescible material hauled by a contracted third party to a permitted facility mainly engaged in producing compost or mulch, or in anaerobic digestion of organics. Minor mechanical separation of contaminants or recyclable materials may occur at the facility prior to composting or digestion.

Other Diversion - all other forms of diversion including self-haul of materials to a MRF or compost facility, mixed-waste processing, source reduction, on-site composting, and reuse. This also includes materials that the generator sells directly to a market. For example, scrap metal sold directly to a recycler or bedding and manure sold as fertilizer by a horse racing track to a local farm is counted as Other Diversion.

Every stream of materials characterized or quantified at every site is assigned to one of these four streams. In many of the tables, figures, and text throughout the report, the four streams are further aggregated in two ways:

Generation - the sum of the four streams.
Curbside Diversion - the sum of the Curbside Recycle quantities and the Curbside Organics quantities.

## Explanation of Tasks

This generator study was divided into two major tasks:

- Calculate industry group specific disposed materials composition and quantity data through sampling at approximately 850 commercial and multi-family generator sites. This task is referred to as Task 2.
- Calculate industry group specific diverted materials composition and quantity data through sampling at a 430 -member subset of the commercial and multifamily generator sites recruited for the study. This task, referred to as Task 4, included any materials that would normally be a part of the waste stream diverted through any method (including curbside diversion, back-hauling, selfhauling, take-back programs, and other methods). It excluded diversion of hazardous materials; medical waste; manufacturing and process chemicals;
fats, oils, and grease; industrial quantities of tires; and other items that are not normally accepted for disposal at municipal solid waste landfills. Although ewaste is banned from landfills, the study did characterize and quantify the diversion of these materials.

The study also included a special analysis (referred to as Task 3) on a subset of the generator sites included in Task 4. Task 3 aimed to assess the performance of curbside programs by focusing on curbside diversion by businesses and multi-family sites. The analysis excluded Other Diversion-the items diverted through back-hauling, selfhauling, take-back programs, and other such methods.

The project team used the same basic methodology in all three tasks; the differences among tasks were isolated to the material streams characterized, the methods used to allocate samples among the regions and industry groups, and the level of detail in the material list used for sorting.

## Industry Groups

The project team recruited commercial generators from 16 industry groups as well as multi-family complexes. Industry groups were designed using the North American Industry Classification System (NAICS), and with several factors in mind: business types with similar waste generation profiles and purposes; industries that generate large amounts of organics; industries with high employment in California; industries with less employment or less diversion opportunities; and project budget. The construction industry group was not included in this study because waste associated with this industry is mainly generated at building sites rather than the site of the business office. Waste generated from construction activities and sites was characterized in a separate disposal facility-based study by CalRecycle.
Industry groups 8 and 16 include subgroups. The project team allocated samples to the listed subgroups but reported results at the group level. The industry groups and subgroups included in this study are listed in Table 21, and the three-digit NAICS codes corresponding to each of the 16 industry groups are listed in Appendix A: Detailed Methodology.

The 16 business groups (and their associated subgroups) were further divided by size based on reported employment at the site, as noted in Table 21. For each group, the number of employees distinguishes small businesses from large businesses. The size break was selected so that approximately 20 percent of employment in a group fell into small businesses (ones that have fewer employees than the size break number) and approximately 80 percent fell into large businesses (the other businesses in the group). During recruitment, the project team attempted to obtain a $4: 1$ ratio between large businesses and small businesses for each industry group. This was a group level target; the ratio within each region or season may not have been $4: 1$. Since small businesses often represent the majority of the number of businesses, but large businesses often represent the majority of employment in an industry group, this ensured each size class was properly represented. Very small businesses, those with fewer than five employees, were excluded from the study because they do not generate enough
material weekly to meet the minimum sample weights and frequently share bins with other businesses. For most industry groups, businesses with fewer than five employees made up far less than 10 percent of all employment for the group; overall, they account for 5 percent of statewide employment.

The multi-family group included complexes with five or more units; complexes with four or fewer units were not included in this study. Disposal characterization and quantity data for multi-family sites in the first two seasons was collected in a separate disposal facility-based study. Over the final two seasons, multi-family characterization and quantity data was collected as part of Task 2. Multi-family diversion characterization was part of Task 4 in this study for all four seasons. The multi-family group was not divided into subgroups by size.

## Sample Allocations

The project team ultimately collected data from 837 business sites and 52 multi-family complexes. The number of sites that participated in the generator-based disposal study (Task 2) and contributed each type of data (composition data or quantity data) are summarized in Table 22.

Table 22. Businesses Sampled - Disposal, by Group

| Group <br> Number | Group Name | Sample Goals | Total Sites Visited | Sites Included in Composition Calculations | Sites Included in Quantity Calculations | Total Streams Sampled |

|  | Totals | 850 | 889 | 888 | 830 | 892 |

The generator-based diversion study (Task 4) targeted 400 business and 30 multifamily sites for diversion sampling. Typically, diversion streams exhibit less variability from generator to generator than disposal streams. This homogeneity means fewer samples are required from diversion streams to achieve a given level of statistical confidence. For this reason, Task 4 targeted fewer generators than Task 2. The project team visited 481 generators and collected composition data from 445 generators. Those 481 generators divert material from more than 1,100 individual diversion streams. In addition to a curbside recycle stream and curbside organics stream, many generators have several other diversion streams such as diverted batteries or pallets back-hauled to a central distribution center for reuse. The number of generators included in the Task 4 diversion analysis is summarized in Table 23.

|  | Commercial Subtotals | 522 | 495 | 319 | 323 | 242 |
|  | Multifamily | 37 | 37 | 38 | 39 | 34 |
|  | Totals | 559 | 532 | 357 | 362 | 276 |

Ideally, complete and high-quality data for both composition and waste quantity would be obtained for each site visited. This is not always the case. The recruitment goals put an emphasis on composition data, and were intended to be the minimum number of sites visited with complete composition data. For all tasks, if the actual number of sites visited exceeded the goal, it was primarily because for a particular site, either the composition or quantity information was not of high enough quality to include in the analysis. For example, the composition data for a site could be good but the quantity data was incomplete (i.e., a representative sample meeting minimum weight requirements was collected and sorted, but the overall quantity of materials could not be estimated with confidence). In this case, the site counted toward the goal, the composition data was included in the composition calculations, and the quantity data was not used. If the quantity data was good but the composition data was

Table 25. Example Recruitment Tracking

| Site | Complete Data |  |
| :---: | :---: | :---: |

| Total | $\mathbf{1 0}$ | $\mathbf{1 1}$ |

incomplete (i.e., the quantity of materials in the desired stream could be estimated with confidence but a representative composition sample could not be obtained and sorted), the site did not count toward the goal, the quantity data was included in the quantity calculations, the composition data was not used, and an additional site was recruited to make up for the missing composition data. This process was repeated until the recruitment goals were met. Table 25 illustrates an example in which 14 sites needed to be recruited to obtain 10 sites with good composition data (and 11 sites had sufficient quantity data).

## Summary of Methods

This section describes the methodology that the project team used to complete this work. For a more detailed description of the study methodology, see Appendix A: Detailed Methodology.

## Selection and Recruitment Process

This section details the sorting facility (node) and generator recruitment processes. Node and generator recruitment were interconnected: The project team recruited nodes first, and then recruited generators within 30 miles of each selected node.

## Node Recruitment

Since the study involved sampling and sorting of disposed waste, solid waste facilities such as landfills and transfer stations were recruited to be sites where samples could be sorted and disposed. These sites served as the central point, or node, used to define the areas where businesses were recruited. CalRecycle staff used CaIRecycle's Solid Waste Information System (SWIS) database to identify potential nodes in each of the study regions that CalRecycle uses for waste characterization studies. The pool of potential nodes included only permitted facilities that accept putrescible solid waste for disposal or transfer/processing. To select nodes for each region and season, staff randomized the list of potential nodes, started recruitment calls at the top of each region's list, and continued until the required number of nodes had been recruited. Except for the Mountain region, the project team recruited one node per region for each of the seasons. Due to the low population and smaller number of businesses in the Mountain region, the project team recruited two nodes for that region and only visited the region during two seasons. A total of 18 nodes were used in the study.

The nodes and regions are mapped in Figure 5 along with their SWIS number and the 30 -mile sample area around each node from which generators sites were recruited. See Appendix A: Detailed Methodology for an explanation of how counties were allocated to each region, and the counties included in each region.

Figure 5. Study Regions and Recruitment Nodes

## Generator Site Recruitment and Assignment to Tasks

After finalizing the list of nodes participating in the study, the project team generated a list of eligible commercial generator sites using the following steps:

1. Map a 30-mile circle around each selected node.
2. Determine which ZIP codes are wholly or substantially within the node circle.
3. Purchase a list of all businesses (from a private business data clearinghouse) with more than five employees within the included ZIP codes.
4. Randomize the list order, assign each site a unique ID number, and import the organized generator information into the recruitment database.

Since multi-family sites were not included in business databases and lists could not be purchased, the methods for generating a list of eligible multi-family sites were different from the methods for generating a list of eligible businesses. Also, for two seasons, multi-family sites were sampled as part of another study, and the nodes used for that sampling were different. The steps to develop a list of eligible multi-family sites included:

1. Mapping a 30-mile circle around each selected multi-family node,
2. Determining which cities are wholly or substantially within the node circle,
3. Developing a list of all multi-family sites within the included cities using an online Yellow Pages search,
4. Randomizing the list order and assigning each multi-family site a unique ID number, and importing the organized generator information into the recruitment database.

After developing the list of potential sites, the project team recruited generator sites for Task 2 using a two-step process. Step 1 included a phone call to confirm the generator's eligibility, willingness to participate, and contact information. If the recruiter discarded a potential site for any reason during Step 1, the next business on the list for that industry group was contacted. Step 2 included a follow-up phone call to collect the additional information needed to (1) determine how to arrange and conduct visits for data-collection purposes, (2) quantify and characterize disposal and diversion, and (3) correlate disposal and diversion information with other information about the generator (such as number of employees, participation in recycling programs, number of visitors, etc.). The project team repeated these steps until the sampling targets were met. The project team recruited additional businesses as contingencies in the event that a site went out of business, backed out of the study, or was otherwise unavailable for sampling. This contingency was generally equal to about 10 percent of the group target.

The project team randomly selected sites for inclusion in Task 4 from the list of recruited generator sites. These were not additional generators; rather, they were a subset of the generators recruited to participate in Task 2.

Task 3 included a special contamination subsort on a portion of the material types in the study. To select sites for the Task 3 subsort, the project team filtered the list of Task 4 sites to include only generators with curbside recycling or curbside organics service and randomly selected sites from within that filtered list. These sites may also have had Other Diversion, but data for that stream was excluded from this analysis.

## Site Visits

This section provides a description of the fieldwork processes for collecting samples, sorting samples, and quantifying material. The field crew visited each selected site to quantify disposal and diversion, and to collect samples for characterization.

## Sample Collection

The field crew collected a sample from a randomly selected vertical cross-section, or "slice," of material from the selected container (see Figure 6). Each sample consisted of all material in the slice, from the top to the bottom of the container. For garbage samples, the field crew ensured that each sample weighed at least 200 pounds. For diversion samples, the field crew collected all material in the container up to 125 pounds.

Figure 6. Example Container with the Slices Illustrated

In cases where the material was inaccessible, unique arrangements were required for the sample collection to proceed. For example, if the site used a compactor, the team provided rolling carts for the businesses to deposit material into for one or more days, instead of into the compactor. The field crew then took material that accumulated in the rolling containers as the sample.

For garbage samples, the field crew contained the collected sample to prevent crosscontamination with other samples, labeled it with relevant details about its source using a sample placard, and transported it to the local node for sorting. Diversion samples were sorted on-site, and materials were returned to the containers.

## Collect Disposal Quantity Information

While on-site at each business, the field crew recorded the volume of waste in each container or collection area. We used this information to calculate annual disposed waste tonnage for each business and extrapolated these results for each industry group. The procedure for measuring waste during the site visit is described below. The field crew recorded this information on paper forms for later entry into the centralized generator database.

- Disposed Waste Volume Measurements: The field crew recorded the length, width, and height to the nearest inch for all disposed waste at each site. The volume of the disposed waste at each site was the sum of all volumes for each waste container or collection area (if there was more than one), in cubic inches.
- Disposed Waste Accumulation Time: During initial recruitment screening calls, recruiters asked the responsible party at the site for information to determine waste accumulation time, including the business operating hours, the time the waste containers were last collected by the hauler (or regular collection schedule), and when trash is regularly taken outside to dumpsters. While on-site, the field crew verified this critical information.

## Collect Curbside Diversion Quantity Information

While on-site, the field crew collected information about the amount of materials collected in recycling and organics containers. We used this as well as other information to calculate annual recycling and diversion quantities for each business. The procedure for measuring materials during the site visit is described below. The field crew recorded this information on paper forms for later entry into the centralized recruitment database.

- Diverted Material Volume Measurements: The field crew recorded the length, width, and height to the nearest inch for all material in recycling and organics containers at each site. The volume of the diverted material at each site was the sum of all volumes for each container (if there was more than one container on-site), in cubic inches.
- Diverted Material Accumulation Time: During initial recruitment screening calls, recruiters asked the responsible party at the site for information to determine diverted material accumulation time, including the business operating hours, the time the containers were last collected by the hauler (or regular collection schedule), and when material is regularly taken to outside containers. While on-site, the field crew verified this critical information.

## Collect Other Diversion Quantity Information

The field crew confirmed additional diversion practices (such as back-hauling, selfhauling, source reduction, and reuse) data during the same visit where they sampled, sorted, and quantified the curbside diversion streams.

The recruitment staff collected information about the site's other diversion practices that the field crew reviewed before they arrived at a site for the diversion assessment. At each site, the field crew met with key personnel to discuss other diversion practices and obtain any records or estimates necessary to quantify other diversion practices. The intent of these meetings was to verify quantity data and other information about diversion activities that the sampling and sorting of materials collected on site did not capture. The following scenarios illustrate some examples of quantifying other diversion:

- Scenario 1: A business back-hauls pallets to a central distribution facility for reuse. The field crew first asked the facility personnel if they could provide records regarding the number of pallets reused. If not, the field crew weighed the pallets on-site and correlated that information with the time elapsed since the last back-haul to estimate the annual quantity of pallets reused.
- Scenario 2: A business donates food to the local food bank. The field crew first asked the facility personnel if they could provide records regarding the quantity of food donated. If not, the field crew weighed the quantity of food set aside for donation and correlated that information with the time elapsed since the last donation to estimate the annual quantity of food donated.
- Scenario 3: A business bales cardboard and self-hauls the material to a local paper pulper. The field crew first asked the facility personnel if they could provide records regarding the number of bales sold. If not, the field crew weighed a bale, multiplied that weight by the number of bales on-site, and correlated that information with the time elapsed since the last haul to estimate the annual quantity of baled cardboard sold.

Other diversion quantity estimates were based on actual receipts or freight documents whenever possible.

During the site visit, the field crew also collected quantity information for any diversion not reported to the recruiters.

## Sorting Procedures

The sorting process for disposal and diversion samples was the same except that samples from each task were sorted in different locations: garbage samples at the local node and diversion samples on-site at each business or multi-family site. After selecting and measuring the volume of each sample, the field crew photographed the sample; sorted the sample into 82 material types; weighed the material in each category; and recorded the weights. The full list of material definitions is included in Appendix B: Material Definitions.

For a portion of the sites included in the Task 3 analysis, both the disposed material stream samples and the curbside diversion stream samples were sorted to a more detailed list. After the field crew sorted these samples into the 82 material types, they further sorted 20 of the material types into three contamination categories: clean, bincontaminated, or source-contaminated. The definition for each contamination category
is included at the end of Appendix B: Material Definitions. The 20 materials included in the more detailed sort are listed in Table 26.

Table 26. Materials Included in the Contamination Subsort

| Paper | Metal |
| :--- | :--- |
| Uncoated Corrugated Cardboard | Tin/Steel Cans - CRV Bimetal Containers |
| Paper Bags | Tin/Steel Cans - Other |
| Newspaper | Aluminum Cans - CRV |
| White Ledger | Aluminum Cans - Non-CRV |
|  | Plastic |
| Other Miscellaneous Paper - Compostable | PETE Containers - CRV |
| Other Miscellaneous Paper - Other | PETE Containers - Non-CRV |
| Remainder/Composite Paper - Rigid Food and Beverage Cartons | HDPE Containers - CRV |
| Remainder/Composite Paper - Compostable | HDPE Containers - Non-CRV |
| Remainder/Composite Paper - Other | Miscellaneous Plastic Containers (\#3-\&7) - CRV |
|  | Miscellaneous Plastic Containers (\#3-\&7) - Non-CRV |

## Changes in Methods from Original Design

The project team made several adjustments to the original study design to address unforeseen circumstances that arose over the course of this study.

Many sites did not dispose of 200 pounds of garbage over a regular collection cycle, so the field crew had to make multiple visits to each site. We limited disposal sample weights to the amount of material collected in three visits for the Bay Area, Southern, and Central Valley regions, and two visits in the Coastal and Mountain regions. If after two or three visits (depending on the region) the field crew had not collected 200 pounds, the sample was considered complete regardless of the sample weight. The field crew typically had more sites to visit in the Bay Area, Southern, and Central Valley regions and consequently spent more consecutive days working in these regions during sampling periods. Sites in these regions were visited three times instead of two because the longer fieldwork period in these regions facilitated more visits.

Node facilities were recruited far in advance of fieldwork to allow time for the generator site recruitment. Over the intervening period between node recruitment and fieldwork, several of the originally recruited nodes either changed their minds about hosting or for other reasons were not able to host the field sorting. In those cases, the recruitment team selected a nearby facility to host the field crew, even though the generator recruitment was centered around the original node.

The project team intended to characterize all disposed samples from multi-family generators in a separate disposal facility-based study. However, after the first two seasons, the disposed multi-family samples were collected and sorted by the Task 2 field crew. This change was made to better accommodate the contamination subsorts necessary for the Task 3 analysis.

The calculation methods used to quantify and characterize the Other Diversion stream were modified to better accommodate the wide range of data collected in the field for this stream.

## Study Results

This section presents the findings for each industry group and for all industry groups combined (the overall commercial sector), and multi-family. Tables and figures in this section refer to the four material streams: Disposed, Curbside Recycle, Curbside Organics, and Other Diversion. Streams are defined at the container level and include all materials placed in the container, whether they "should" be there or not. For example, all material in a curbside recycling container will be processed at a MRF, regardless of whether that material is actually recoverable, and all materials in a disposal bin will be disposed, including recyclables. The Other Diversion stream includes materials recovered apart from the curbside streams.

Results include findings for the quantities of materials in each stream, the rates at which they are produced, and overall densities for each stream. Also presented are the composition of materials in each of the four streams, recoverability of materials in each stream, and overall recoverability of all materials generated (all streams combined).

The 82 material types have been aggregated into five recoverability groups: Curbside Recyclable, Compost/Mulch, Other Recyclable, Recoverable Inerts, and Other Materials. The recoverability groups are defined at the material level, i.e. materials in the Curbside Recyclable group are materials that most MRFs could recover and sell.
For the purposes of this study, we have defined the recoverability group as follows:

- Curbside Recyclable: materials that most Material Recovery Facilities (MRFs) collect, bale, and market.
- Compost/Mulch: materials that fall under AB 1826, California's Mandatory Commercial Organics Recycling law.
- Other Recyclable: materials that are readily recyclable but usually not accepted in a curbside recycling program. These materials are often collected at drop-off locations.
- Recoverable Inerts: recoverable inert construction and demolition debris.
- Other Materials: all materials that do not fit in one of the other groups.

Materials from any recoverability group can be found in any stream. Curbside Recyclable materials are frequently found in the Disposed stream (businesses frequently throw away cardboard and aluminum cans) and Other Materials are frequently found in the Curbside Recycle stream (businesses frequently put hardcover books and broken drinking glasses in their recycling bin). A detailed list of the materials included in each recoverability group can be found in Appendix B: Material Definitions.

Throughout the report, recoverability groups are referenced with bold text (e.g.
Recoverable Inerts), and individual material types are referenced with italics (uncoated corrugated cardboard, for example).

## Rate and Density Findings

Tables and figures in this section summarize the quantity information for each group and for the commercial sector overall. Quantities disposed, diverted, and generated have been normalized on a per employee basis (or on a per occupied unit basis for multi-family). Normalizing the quantities facilitates comparisons between the various industry groups.

When interpreting the results presented in the tables and figures in this section, it is important to consider the effect of rounding.

To keep tables and figures readable, estimated rates are rounded to two decimal points, and density is rounded to the nearest whole number. Due to this rounding, the data presented, when added together, may not exactly match the subtotals and totals shown.

It is important to recognize that the data presented in the tables were calculated using unrounded numbers. Therefore, using the rounded values shown in the tables in calculations will yield quantities that are different than those shown. Values of less than 0.005 are shown as 0.00 .

Statewide, businesses disposed of approximately 1.13 tons per employee per year (TPEPY) and diverted another 0.64 TPEPY. In total, businesses across the state generated an estimated 1.77 TPEPY. Based on these findings, the commercial diversion rate was estimated to be 36 percent. Diversion was broadly defined to include any activity that avoids disposing of waste (including reuse, when it can be quantified). The majority of commercial diversion was in the Other Diversion stream, most frequently cardboard that was diverted via back-hauling or sales directly into the commodity market. The overall commercial sector TPEPY does not include the findings from multi-family properties.

Retail Trade - Food and Beverage Stores (Group 11) had the highest generation rate of all industry groups (6.64 TPEPY) and the greatest estimated diversion rate ( 82 percent). Both of those metrics are due to the large quantity of uncoated corrugated cardboard and food in the Other Diversion stream. Group 11 is mostly composed of grocery stores.

The Arts, Entertainment, and Recreation group (Group 1) and Durable Wholesale and Trucking (Group 2) had the next two highest generation rates (3.08 TPEPY and 2.99 TPEPY, respectively). Durable Wholesale and Trucking (Group 2) also had the next highest diversion rate ( 80 percent). The high generation rate and diversion rate for Group 2 were largely due to high Other Diversion rates for sites in this group. Group 2 businesses diverted large quantities of uncoated corrugated cardboard and scrap metal. The high generation rate for Group 1 was mostly due to the high Disposed TPEPY for this group (the highest in the study). The high Disposed TPEPY in Group 1 can be partly attributed to the fact both employees and large numbers of visitors and guests were generating material at these sites. Group 1 included live performance venues, parks, fairgrounds, bowling alleys, movie theaters, and stadiums. Group 2 was mostly composed of businesses warehousing and shipping durable consumer goods (items generally with a normal life expectancy of three years or more) such as motor vehicles,
furniture, construction materials, machinery and equipment (including household-type appliances), sporting goods, toys, and hobby goods.
The Public Administration group (Group 9) had the second-lowest Disposed TPEPY ( 0.32 TPEPY) and the lowest generated TPEPY ( 0.39 TPEPY) of all groups. Group 9 included all public sector sites, such as local government buildings and police and fire stations, but it did not include schools (public or private). The diversion rate for Group 9 was 16 percent.

The Medical and Health group (Group 8) had the lowest diversion rate of the studied groups ( 9 percent). This was likely due to a combination of the types of materials generated (such as patient gowns, tubing, and gloves) that could not be recovered and privacy policies that reduced the recovery of paper.

Multi-family properties disposed of an estimated 0.74 tons per occupied unit per year (TPUPY) and generated an estimated 0.87 TPUPY. None of the multi-family units visited had materials in the Other Diversion stream. Multi-family estimates did not take into account any diversion (e.g., recycling of computer equipment, furniture, etc.) done by tenants of the multi-family complex independently of the buildings' management and custodial services. The estimated diversion rate for the multi-family group was 15 percent.
Table 27 presents TPEPY results by industry group and for the overall commercial sector, and multi-family. The TPEPY was calculated for each industry group as a weighted average of the TPEPY at large businesses and the TPEPY at small businesses in that group. The calculations are detailed in Appendix C: Description of Calculations.

Table 27. Generation Rate Summary by Weight, by Group (TPEPY)

| Group Number and Name | Tons per Employee per Year |  |  |  |  | Diversion Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Disposed | Curbside Recycle | Curbside Organics | Other Diversion | Generation |  |
| Overall Commercial Sector | 1.13 | 0.14 | 0.12 | 0.39 | 1.77 | 36\% |
| $\begin{array}{ll} \hline 1 & \text { Arts, Entertainment, \& } \\ \text { Recreation } \end{array}$ | 2.56 | 0.17 | 0.03 | 0.33 | 3.08 | 17\% |
| 2 Durable Wholesale \& Trucking | 0.60 | 0.17 | 0.00 | 2.23 | 2.99 | 80\% |
| 3 Education | 0.43 | 0.05 | 0.01 | 0.02 | 0.50 | 15\% |
| 4 Hotels \& Lodging | 1.72 | 0.22 | 0.01 | 0.18 | 2.14 | 20\% |
| 5 Manufacturing Electronic Equipment | 0.31 | 0.07 | 0.00 | 0.36 | 0.75 | 58\% |
| 6 <br> Manufacturing - Food \& Nondurable Wholesale | 1.28 | 0.05 | 0.01 | 0.51 | 1.85 | 31\% |
| Manufacturing - All Other | 0.45 | 0.10 | 0.00 | 0.94 | 1.50 | 70\% |
| 8 Medical \& Health | 0.67 | 0.05 | 0.01 | 0.01 | 0.74 | 9\% |
| 9 Public Administration | 0.32 | 0.04 | 0.00 | 0.02 | 0.39 | 16\% |
| 10 Restaurants | 2.40 | 0.26 | 0.17 | 0.08 | 2.92 | 18\% |
| 11 Retail Trade - Food \& Beverage Stores | 1.21 | 0.15 | 0.13 | 5.15 | 6.64 | 82\% |
| 12 Retail Trade - All Other | 2.14 | 0.10 | 0.00 | 0.17 | 2.41 | 11\% |
| Services - Management, <br> 13 Administrative, Support, \& Social | 0.74 | 0.11 | 0.57 | 0.02 | 1.44 | 48\% |
| 14 Services - Professional, Technical, \& Financial | 1.86 | 0.32 | 0.08 | 0.04 | 2.31 | 19\% |
| 15 Services - Repair \& Personal | 0.94 | 0.15 | 0.24 | 0.18 | 1.50 | 38\% |
| 16 Not Elsewhere Classified | 0.50 | 0.05 | 0.01 | 0.64 | 1.20 | 58\% |
| 17 Multifamily* | 0.74 | 0.13 | 0.00 |  | 0.87 | 15\% |

*Multifamily is reported in tons per unit per year

Using the data collected during the site visits, the project team also calculated the annual volume of material disposed and diverted through curbside programs at each generator. These annual volumes were then normalized on a per employee basis to estimate the Cubic Yards Per Employee Per Year (YPEPY). At many generator sites, the annual quantities of Other Diversion materials were based on records provided by the business instead of direct measurements of material in containers. For this reason, the YPEPY cannot be calculated for the Other Diversion stream.

Businesses across the state disposed of an estimated 16.4 YPEPY and diverted approximately 6.4 YPEPY through curbside programs. Retail Trade - All Other (Group 12) had the greatest Disposed YPEPY at 31.1 YPEPY, and Public Administration (Group 9) had the lowest, with slightly more than 5 YPEPY. Restaurants (Group 10) had the highest combined Disposed and curbside diversion, with 40.9 YPEPY.

Table 28 presents yards per employee per year results by industry group, for the overall commercial sector, and for multi-family generator sites. The YPEPY was calculated for each industry group as a weighted average of the YPEPY at large businesses and the YPEPY at small businesses in that group. The calculations are detailed in Appendix C: Description of Calculations.

Table 28. Generation Rate Summary by Volume, by Group (YPEPY)

| Group Number and Name | Cubic Yards per Employee per Year |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Disposed | Curbside Recycle | Curbside Organics | Curbside Total |
| Overall Commercial Sector | 16.36 | 4.72 | 1.72 | 22.81 |
| 1 Arts, Entertainment, \& Recreation | 24.34 | 7.37 | 0.48 | 32.19 |
| 2 Durable Wholesale \& Trucking | 12.29 | 2.60 | 0.00 | 14.89 |
| 3 Education | 6.83 | 2.48 | 0.16 | 9.47 |

[^0]Table 29 provides density summaries for the Disposed, Curbside Recycle, and Curbside Organics streams, by industry group and for the overall commercial sector, and multi-family. The density was calculated based on the estimated annual volume and annual weight of materials at the study sites and excludes sites with compactors. The project team could not calculate densities for the Other Diversion stream because most Other Diversion stream samples did not have volumes associated with them. The density was calculated for each industry group as a weighted average of the density at large businesses and the density at small businesses in that group. Many industry groups (for example, Durable Wholesale \& Trucking) did not have curbside compost at any of the sampled generator sites. For those groups, the curbside organics density is blank. The calculations are detailed in Appendix C: Description of Calculations.

Table 29. Density Summary, by Group

| Group Number and Name | Pounds per Cubic Yard |  |  |
| :--- | ---: | ---: | ---: |
|  | Disposed | Curbside <br> Recycle | Curbside <br> Organics |
| Overall Commercial Sector | 138 | 58 | 135 |
| 1 | Arts, Entertainment, \& Recreation | 153 | 47 |
| 2 | Durable Wholesale \& Trucking | 77 | 31 |

Different types of businesses generate different types of materials. A business' waste generation pattern, waste management practices, and the prevalence of that business type in California have an effect on the overall commercial sector waste stream. The following are highlights for several of the largest industry groups.

The Services - Professional, Technical, and Financial group accounted for approximately 19 percent of the overall commercial sector generation, making it the largest generator in the state. This group also employs the most people in California. Examples of business types in this group include banks, real estate agencies, architecture firms, and engineering companies. The majority of generation in this group is in the Disposed stream-materials that are disposed directly from the businesses without further significant recovery.

At nearly 14 percent of overall generation, Restaurants is the second-largest industry group in the study on the basis of tons generated. The Disposed waste stream is the largest part of Restaurants generation. Although more and more restaurants are participating in food diversion programs, food is the most prevalent divertible material type in the Restaurants' Disposed waste.

Services - Management, Administrative, Social, and Support and Retail Trade - All Other are the only other groups to generate more than 10 percent of the overall commercial sector waste. These two groups have very different total generation composition profiles. The Disposed stream accounted for nearly 90 percent of the Retail Trade - All Other generation, but that proportion was approximately 52 percent in the Services - Management, Administrative, Social and Support group.

Manufacturing - Electronic Equipment accounted for less than 1 percent of the overall commercial sector generation, making it the smallest group (by generation) in the state. Manufacturing - Electronic Equipment includes businesses manufacturing physical goods such as computers, radios, computing and memory chips, transformers, electrical appliances, and batteries, but it does not include software developers.

Figure 7 summarizes the annual generation by material stream for each industry group and the multi-family group. The percentages reflect that group's proportion of total commercial sector generation (nearly 26 million tons), excluding the multi-family group.

Figure 7. Annual Generation for Industry Groups, by Stream

Services - Professional, Technical, and Financial was the largest group in the state, by employment, and disposed of more material, by weight, than any other group. Among all the industry groups, Retail Trade - Food and Beverage Stores diverted the most material, by weight. Hotels and Lodging had the fewest employees among the industry groups studied. Table 30 ranks all industry groups according to statewide employment, tons disposed, tons diverted, and tons generated.

Table 30. Rankings, by Group

|  | Statewide Employment* | $\%$ of <br> Statewide <br> Employment | Rank by Employment | Tons Disposed | \% of Comm. Disposal | Rank by Tons Disposed | Tons Diverted | \% of Comm. Diversion | Rank by Tons Diverted | Tons Generated | \% of Comm. Generation | Rank by Tons Generated | $\begin{array}{\|c\|} \hline \text { Diversion } \\ \text { Rate } \\ \hline \end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Employment based on 2013 data provided by CalRecycle

## Notes for the Composition and Quantity Findings

This section of the report presents the composition and quantity data for the overall commercial sector and each of the industry groups separately, and multi-family. Overall findings for each group are presented in five ways:

1. A table summarizing the key findings and metrics for the industry group, including disposed TPEPY, diverted TPEPY, disposed tons, diverted tons, diversion rate, and the three most prevalent divertible materials (by weight) in the disposed stream.
2. A bar chart summarizing the quantity and proportion of material generated by each material stream.
3. A bar chart that breaks down the composition of materials in each stream, according to potential recoverability.
4. A bar chart summarizing how much of all materials generated fall into each recoverability group. This includes all streams combined-both materials currently diverted and divertible materials placed in the Disposed stream.
5. A table detailing the quantity and composition for each stream. The detailed table aggregates the 82 material types used for sorting into 68 material types for reporting. Appendix B: Material Definitions includes a summary of how materials are aggregated from the 82 types down to 68 types. Appendix E : Detailed Composition Tables shows data for all streams according to the 82 detailed types, including error ranges. These tables also include data for California Redemption Value (CRV) materials.

Note: Estimates of the amount of contamination in recycling and organics bins are included. For this study, contamination in a bin consisted of materials not generally accepted in curbside recycling or organics programs, as listed in Table 95 of Appendix B: Material Definitions. Materials accepted in local programs may differ from this list.

## Rounding

When interpreting the results presented in the tables and figures in this report, it is important to consider the effect of rounding.

To keep the waste composition tables and figures readable, estimated tonnages are rounded to the nearest ton, and estimated percentages are rounded to the nearest tenth of a percent. Due to this rounding, the tonnages presented in the report, when added together, may not exactly match the subtotals and totals shown. Similarly, the percentages, when added together, may not exactly match the subtotals or totals shown. Percentages less than 0.05 percent are shown as 0.0 percent.

It is important to recognize that the quantities presented in the tables were calculated using unrounded percentages. Therefore, using the rounded percentages shown in the tables to calculate quantities will yield quantities that are different than those shown in the report.

For example, the rounded percentage for Disposed food in Table 32 is shown as 24.4 percent, but the unrounded number used in calculations was 24.4048519294363 percent. If the rounded percentage for Disposed food in Table 32 were used to calculate the tonnage, it would yield the following: 24.4 percent $\times 16,536,664$ (the rounded Disposal tonnage) $=4,034,946$ tons. However, if the more precise percentage for this material is used, it yields the following: 24.4048519294363 percent multiplied by $16,536,663.65$ (the unrounded tonnage) $=4,035,748.27688004$ tons, or $4,035,748$ tons when rounded to the nearest ton. Using unrounded instead of rounded numbers in the calculations results in a difference of more than 800 tons. The more precise tonnage of $4,035,748$ is shown in the table.

## Findings for the Overall Commercial Sector

This section summarizes the results for samples from all business generator sites. The results exclude data collected at the multi-family sites. Statewide, the commercial sector disposes of more than 16.5 million tons and diverts nearly 9.4 million tons. Based on these findings, the commercial diversion rate was estimated to be 36 percent. Diversion was broadly defined to include any activity that avoids disposing of waste (including reuse, when it can be quantified). The majority of commercial diversion was in the Other Diversion stream, most frequently cardboard that was diverted via back-hauling or sales directly into the commodity market. The overall commercial sector TPEPY does not include the findings from multi-family properties. Total generation was approximately 1.77 TPEPY. Food was the most prevalent divertible material type in the overall commercial sector Disposed stream, accounting for 24 percent of disposal. Table 31 summarizes the key findings for the overall commercial sector.

Table 31. Key Findings and Metrics: Overall Commercial Sector

| Overall Commercial Sector |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Food (24\%, 4,035,748 tons) |  |  |  |  |
| - Remainder/Composite Paper - Compostable (10\%, 1,673,592 tons) |  |  |  |  |
| - Clean Pallets \& Crates (4\%, 735,005 tons) |  |  |  |  |

Figure 8 presents the annual tons for each stream in the overall commercial sector. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams, such as food in recycling bins or glass in organics bins. As shown, almost two-thirds of total generation at businesses went to the Disposed stream, and the remaining one-third was in the diversion streams.

Figure 8. Annual Tons by Waste Stream: Overall Commercial Sector

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 9 breaks down the potential recoverability (by recoverability group) for each stream in the overall commercial sector. As shown, Compost/Mulch accounted for almost half of the Disposed stream. The Other Diversion stream was nearly evenly split between Curbside Recyclable,
Compost/Mulch, and Other Recyclable materials. Figure 9 illustrates that recyclable materials were found in the Disposed stream and that materials not usually recovered ("Other Materials") were indeed recovered by some businesses. In fact, materials of all recoverability types were found in all streams.

The overall commercial sector Curbside Recycle contamination rate was 16 percent, and the Curbside Organics contamination rate was 2 percent.

Figure 9. Recoverability by Stream: Overall Commercial Sector

Figure 10 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 10 illustrates, approximately 43 percent of total generation in the overall commercial sector was material in the Compost/Mulch recoverability group, and approximately 25 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 81 percent of the overall commercial sector generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 10. Recoverability of Materials Generated in the Overall Commercial Sector

Table 32 presents detailed overall commercial sector composition results for each stream as well as for the total generation.

Table 32. Composition Summary: Overall Commercial Sector

| Material | Disposed |  | Curbside Recycle Est. \% Est. Tons |  | Curbside Organics Est. \% Est. Tons |  | Other Diversion |  | Total Generation |  |

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Arts, Entertainment, \& Recreation

Table 33 presents key findings for the Arts, Entertainment, \& Recreation industry group (Group 1). Statewide, Group 1 disposed of nearly 830,000 tons and diverted more than 168,000 tons. Total generation was approximately 3.08 TPEPY. Group 1 had the second-highest generation rate and the highest Disposed stream TPEPY among all industry groups. The high Disposed TPEPY in Group 1 can be partly attributed to the fact that it was not just employees generating material at these businesses-large numbers of visitors and guests were also generating material at these sites. Group 1 included live performance venues, parks, fairgrounds, bowling alleys, movie theaters, and stadiums. Food was the most prevalent divertible material type in the Group 1 Disposed stream, accounting for 34 percent of disposal. Group 1 had the second densest Disposed stream of any industry group, 153 pounds per cubic yard (slightly higher than for restaurants). This likely reflects the high proportion of food in the Group 1 Disposed stream.

Table 33. Key Findings and Metrics: Arts, Entertainment, \& Recreation

| Arts, Entertainment, \& Recreation |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed TPEPY | Diverted TPEPY | Disposed Tons | Diverted Tons | Diversion Rate |
| 2.56 | 0.52 | 829,661 | 168,036 | 17\% |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Food (34\%, 278,639 tons) <br> - Remainder/Composite Paper - Compostable (9\%, 78,350 tons) <br> - Leaves and Grass ( $6 \%, 48,015$ tons) |  |  |  |  |

In addition to normalizing generation on a per employee basis (TPEPY), for this group the project team normalized generation by the number of annual visitors at each generator site. As shown in Table 34, Group 1 businesses generated an estimated 0.53 tons per thousand visitors per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 34. Generation Rate Summary by Weight: Arts, Entertainment, \& Recreation (tons per 1,000 visitors per year)

| Tons per 1,000 Visitors per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :---: | ---: | ---: | ---: | ---: | ---: |
| Arts, Entertainment, \& Recreation | 0.43 | 0.03 | 0.01 | 0.06 | $\mathbf{0 . 5 3}$ |

Figure 11 presents the annual tons for each stream in Group 1. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 83 percent of generation at Group 1 businesses went to the Disposed stream.

Figure 11. Annual Tons by Waste Stream: Arts, Entertainment, \& Recreation

Each stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 12 breaks down the potential recoverability (by recoverability group) for each stream in Group 1. As shown, more than three-quarters of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 1 Curbside Recycle contamination rate was 11 percent. No contamination was observed in the Curbside Organics stream.

Figure 12. Recoverability by Stream: Arts, Entertainment, \& Recreation

Figure 13 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 13 illustrates, approximately 57 percent of total generation in Group 1 was material in the Compost/Mulch recoverability group. Other Materials and Curbside Recyclable accounted for 19 percent and 17 percent of total generation, respectively. When combined, divertible materials accounted for roughly 81 percent of the Group 1 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 13. Recoverability of Materials Generated in the Arts, Entertainment, \& Recreation Sector

Table 35 presents detailed composition results for each stream in Group 1, as well as for the total group generation.

Table 35. Composition Summary: Arts, Entertainment, \& Recreation

| Material | Disposed |  | Curbside Recycle Est. \% Est. Tons |  | Curbside Organics <br> Est. \% Est. Tons |  | Other Diversion |  | Total Generation |  |

## Findings for Durable Wholesale \& Trucking

Table 36 presents key findings for the Durable Wholesale \& Trucking industry group (Group 2). Group 2 was mostly composed of businesses warehousing and shipping durable consumer goods (items generally with a normal life expectancy of three years or more) such as motor vehicles, furniture, construction materials, machinery and equipment (including household-type appliances), sporting goods, toys, and hobby goods. Statewide, Group 2 diverted more than 1.5 million tons and had one of the highest diversion rates: 80 percent. The Group 2 generation rate was approximately 2.99 TPEPY, third-highest among all industry groups. The high generation rate and diversion rate for Group 2 were largely due to high Other Diversion rates for sites in this group. Group 2 businesses diverted large quantities of uncoated corrugated cardboard and scrap metal. Clean pallets and crates was the most prevalent divertible material type in the Group 2 Disposed stream, accounting for 13 percent of disposal.

Table 36. Key Findings and Metrics: Durable Wholesale \& Trucking

## Durable Wholesale \& Trucking

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| :---: | :---: | :---: | :---: | :---: |
| 0.60 | 2.40 | 381,767 | $1,538,803$ | $80 \%$ |

Top Three Diversion Opportunities in Disposed Stream

- Clean Pallets \& Crates (13\%, 50,937 tons)
- Food (10\%, 38,192 tons)
- Remainder/Composite Paper - Compostable (6\%, 24,689 tons)

Figure 14 presents the annual tons for each stream in Group 2. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means, such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately three-quarters of total generation at Group 2 businesses went to the Other Diversion stream, and most of the remaining generation was in the Disposed stream. Group 2 reuses large quantities of uncoated corrugated cardboard boxes and sells large quantities of uncoated corrugated cardboard and other ferrous metal.

Figure 14. Annual Tons by Waste Stream: Durable Wholesale \& Trucking

Each stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 15 breaks down the potential recoverability (by recoverability group) for each stream in Group 2. As shown, approximately two-thirds of the Disposed stream was divertible, mostly Compost/Mulch materials. The Other Diversion stream was primarily Other Recyclable materials, including scrap metals not usually recycled through curbside programs.

The Group 2 Curbside Recycle contamination rate was 13 percent. The study did not include any sites from this group with Curbside Organics.

Figure 15. Recoverability by Stream: Durable Wholesale \& Trucking

Figure 16 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 16 illustrates, approximately 46 percent of total generation in Group 2 was material in the Other Recyclable recoverability group, and approximately 24 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 87 percent of the Group 2 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 16. Recoverability of Materials Generated in the Durable Wholesale \& Trucking Sector

Table 37 presents detailed composition results for each stream in Group 2, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Education

Table 38 presents key findings for the Education industry group (Group 3). Group 3 had one of the lowest generation rates, 0.50 TPEPY, and one of the lowest diversion rates, 15 percent, in the study. Food was the most prevalent divertible material type in the Group 3 Disposed stream, accounting for 34 percent of disposal.

Table 38. Key Findings and Metrics: Education

| Education |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |  |
| 0.43 | 0.07 | 562,442 | 97,926 | $15 \%$ |  |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |  |
| - Food (34\%, 189,957 tons) |  |  |  |  |  |
| - Remainder/Composite Paper - Compostable (13\%, 71,730 tons) |  |  |  |  |  |
| - Other Miscellaneous Paper - Other (4\%, 22,709 tons) |  |  |  |  |  |

In addition to normalizing generation on a per employee basis (TPEPY), for this group the project team normalized generation by the number of students at each generator site. As shown in Table 39, Group 3 sites generated an estimated 3.67 tons per hundred students per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 39. Generation Rate Summary by Weight: Education (tons per 100 students per year)

| Tons per 100 Students per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Education | 3.23 | 0.26 | 0.06 | 0.12 | $\mathbf{3 . 6 7}$ |

Figure 17 presents the annual tons for each stream in Group 3. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 85 percent of total generation at Group 3 businesses went to the Disposed stream.

Figure 17. Annual Tons by Waste Stream: Education

Figure 18 breaks down the potential recoverability (by recoverability group) for each stream in Group 3. As shown, more than three-quarters of the Disposed stream was divertible, mostly Compost/Mulch materials.
The Group 3 Curbside Recycle contamination rate was 19 percent, and the Curbside Organics contamination rate was 4 percent.

Figure 18. Recoverability by Stream: Education

Figure 19 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 19 illustrates, approximately 48 percent of total generation in Group 3 was material in the Compost/Mulch recoverability group, and approximately 25 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 80 percent of the Group 3 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 19. Recoverability of Materials Generated in the Education Sector

Table 40 presents detailed composition results for each stream in Group 3, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Hotels \& Lodging

Table 41 presents key findings for the Hotels \& Lodging industry group (Group 4). Statewide, Group 4 disposed of more than 384,000 tons and diverted nearly 94,000 tons. Total generation was approximately 2.14 TPEPY. Food was the most prevalent divertible material type in the Group 4 Disposed stream, accounting for 32 percent of disposal. Hotels \& Lodging had the fewest employees among the industry groups studied.

Table 41. Key Findings and Metrics: Hotels \& Lodging

| Hotels \& Lodging |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed TPEPY | Diverted TPEPY | Disposed Tons | Diverted Tons | Diversion Rate |
| 1.72 | 0.42 | 384,327 | 93,712 | 20\% |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Food (32\%, 123,483 tons) <br> - Remainder/Composite Paper - Compostable (9\%, 34,549 tons) <br> - Other Miscellaneous Paper - Other (3\%, 10,188 tons) |  |  |  |  |

In addition to normalizing generation on a per employee basis (TPEPY), the project team normalized generation by the number of guest rooms at each generator site. As shown in Table 42, Group 4 businesses generated an estimated 1.31 tons per guest room per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 42. Generation Rate Summary by Weight: Hotels \& Lodging (tons per guest room per year)

| Tons per Guest Room per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Hotels \& Lodging | 0.94 | 0.17 | 0.01 | 0.18 | $\mathbf{1 . 3 1}$ |

Figure 20 presents the annual tons for each stream in Group 4. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 80 percent of total generation at Group 4 businesses went to the Disposed stream.

Figure 20. Annual Tons by Waste Stream: Hotels \& Lodging

Each stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 21 breaks down the potential recoverability (by recoverability group) for each stream in Group 4. As shown, more than three-quarters of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 4 Curbside Recycle contamination rate was 43 percent, largely due to pallets and crates in the recycling bins. No contamination was observed in the Curbside Organics stream.

Figure 21. Recoverability by Stream: Hotels \& Lodging

Figure 22 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 22 illustrates, approximately 46 percent of total generation in Group 4 was material in the Compost/Mulch recoverability group, and approximately 27 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 81 percent of the Group 4 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 22. Recoverability of Materials Generated in the Hotels \& Lodging Sector

Table 43 presents detailed composition results for each stream in Group 4, as well as for the total group generation.

Table 43. Composition Summary: Hotels \& Lodging

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Manufacturing - Electronic Equipment

Table 44 presents key findings for the Manufacturing - Electronic Equipment industry group (Group 5). This group includes businesses manufacturing physical goods such as computers, radios, computing and memory chips, transformers, electrical appliances, and batteries, but it does not include software developers. Statewide, Group 5 disposed of more than 91,000 tons and diverted nearly 126,000 tons for a total generation rate of approximately 0.75 TPEPY. By weight, Group 5 accounted for less than 1 percent of the overall commercial sector generation, making it the smallest group (by generation) in the state. Remainder/composite paper - compostable was the most prevalent divertible material type in the Disposed stream at 13 percent of disposal. Manufacturing Electronic Equipment had the least dense Disposed stream, approximately 70 pounds per cubic yard. This correlates with the qualitative observations by the field crew that many of these businesses had primarily plastic film and Styrofoam packing materials in their waste bins.

Table 44. Key Findings and Metrics: Manufacturing - Electronic Equipment

## Manufacturing - Electronic Equipment

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| :---: | :---: | :---: | :---: | :---: |
| 0.31 | 0.43 | 91,265 | 125,666 | $58 \%$ |

Top Three Diversion Opportunities in Disposed Stream

- Remainder/Composite Paper - Compostable (13\%, 11,945 tons)
- Food (11\%, 10,310 tons)
- Clean Pallets \& Crates (11\%, 9,598 tons)

Figure 23 presents the annual tons for each stream in Group 5. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. Nearly half ( 48 percent) of Group 5 generation can be attributed to the Other Diversion stream. Group 5 generators sell large quantities of scrap metal directly to recyclers.

Figure 23. Annual Tons by Waste Stream: Manufacturing - Electronic Equipment

Each stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 24 breaks down the potential recoverability (by recoverability group) for each stream in Group 5. As shown, Compost/Mulch materials were the largest fraction in the Disposed stream, and Other Recyclable materials (including scrap metal) was the largest part of the Other Diversion stream.

The Group 5 Curbside Recycle contamination rate was 10 percent. The study did not include any sites from this group with Curbside Organics.

Figure 24. Recoverability by Stream: Manufacturing - Electronic Equipment

Figure 25 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 25 illustrates, approximately 35 percent of total generation in Group 5 was material in the Other Recyclable recoverability group, and approximately 27 percent was Compost/Mulch. When combined, divertible materials accounted for roughly 83 percent of the Group 5 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 25. Recoverability of Materials Generated in the Manufacturing - Electronic Equipment Sector

Table 45 presents detailed composition results for each stream in Group 5, as well as for the total group generation.

## Findings for Manufacturing - Food \& Nondurable Wholesale

Table 46 presents key findings for the Manufacturing - Food \& Nondurable Wholesale industry group (Group 6). This group consists of manufacturers of food, beverages, and tobacco products; and wholesalers of non-durable goods such as paper, apparel, groceries, and chemicals. Statewide, Group 6 disposed of more than 582,000 tons and diverted nearly 262,000 tons. Total generation was approximately 1.85 TPEPY. Food was the most prevalent divertible material type in the Group 6 Disposed stream, accounting for 38 percent of disposal.

Table 46. Key Findings and Metrics: Manufacturing - Food \& Nondurable Wholesale

## Manufacturing - Food \& Nondurable Wholesale

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| ---: | :---: | :---: | :---: | :---: |
| 1.28 | 0.57 | 582,486 | 261,646 | $31 \%$ |

## Top Three Diversion Opportunities in Disposed Stream

- Food (38\%, 220,403 tons)
- Remainder/Composite Paper - Compostable (8\%, 45,184 tons)
- Clean Pallets \& Crates (4\%, 23,205 tons)

Figure 26 presents the annual tons for each stream in Group 6. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means, such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams, such as food in recycling bins or glass in organics bins. The curbside diversion streams combined were approximately 4 percent of generation, and Other Diversion was an additional 28 percent. Approximately 68 percent of the Other Diversion stream was food. Many of the generators in this group back-haul or self-haul their organics for animal feed, composting, or anaerobic digestion.

Figure 26. Annual Tons by Waste Stream: Manufacturing - Food \& Nondurable Wholesale

Percentage reflects the proportion of industry group generation

Each stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 27 breaks down the potential recoverability (by recoverability group) for each stream in Group 6. As shown, more than three-quarters of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 6 Curbside Recycle contamination rate was 14 percent, and the Curbside Organics contamination rate was 6 percent.

Figure 27. Recoverability by Stream: Manufacturing - Food \& Nondurable Wholesale

Figure 28 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 28 illustrates, two-thirds of total generation in Group 6 was material in the Compost/Mulch recoverability group. Other Materials and Curbside Recyclable accounted for 15 percent and 13 percent of total generation, respectively. When combined, divertible materials accounted for roughly 85 percent of the Group 6 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 28. Recoverability of Materials Generated in the Manufacturing - Food \& Nondurable Wholesale Sector

Table 47 presents detailed composition results for each stream in Group 6, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Manufacturing - All Other

Table 48 presents key findings for the Manufacturing - All Other industry group (Group 7). Statewide, Group 7 disposed of more than 384,000 tons and diverted nearly 886,000 tons, mostly through the Other Diversion stream. Total generation was approximately 1.50 TPEPY. Remainder/composite paper - compostable was the most prevalent divertible material type in the Group 7 Disposed stream, accounting for 9 percent of disposal. Approximately 66 percent of the Group 7 Other Diversion stream was other ferrous and other non-ferrous.

Table 48. Key Findings and Metrics: Manufacturing - All Other

## Manufacturing - All Other

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| ---: | :---: | :---: | :---: | :---: |
| 0.45 | 1.05 | 384,292 | 885,586 | $70 \%$ |

Top Three Diversion Opportunities in Disposed Stream

- Remainder/Composite Paper - Compostable (8\%, 29,777 tons)
- Food (7\%, 26,907 tons)
- Clean Pallets \& Crates (6\%, 21,632 tons)

As shown in Figure 29, the Other Diversion stream accounted for approximately 63 percent of total generation in Group 7. The majority of the remaining generation (30 percent) is the Disposed stream. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins.

Figure 29. Annual Tons by Waste Stream: Manufacturing - All Other

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 30 breaks down the potential recoverability (by recoverability group) for each stream in Group 7. As shown, the Other Diversion stream was primarily Other Recyclable materials.

The Group 7 Curbside Recycle contamination rate was 23 percent, largely from lumber found in recycling bins. The study did not include any sites from this group with Curbside Organics.

Figure 30. Recoverability by Stream: Manufacturing - All Other

Figure 31 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 31 illustrates, approximately 47 percent of total generation in Group 7 was material in the Other Recyclable recoverability group, and approximately 28 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 88 percent of the Group 7 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 31. Recoverability of Materials Generated in the Manufacturing - All Other Sector

Table 49 presents detailed composition results for each stream in Group 7, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Medical \& Health

Table 50 presents key findings for the Medical \& Health industry group (Group 8). Statewide, Group 8 disposed of more than 1 million tons annually and had a 9 percent diversion rate, the lowest diversion rate of any industry group. This was likely due to a combination of the types of materials generated (such as patient gowns, tubing, and gloves) that could not be recovered and privacy policies that reduced the recovery of paper. Food was the most prevalent divertible material type in the Group 8 Disposed stream, accounting for 22 percent of disposal.

Table 50. Key Findings and Metrics: Medical \& Health

| Medical \& Health |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |  |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |  |  |  |  |  |
| 0.67 |  |  |  |  |  | 0.06 | $1,003,316$ | 93,629 | $9 \%$ |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |  |  |  |  |  |
| - Food (22\%, 216,983 tons) |  |  |  |  |  |  |  |  |  |
| - Remainder/Composite Paper - Compostable (11\%, 109,841 tons) |  |  |  |  |  |  |  |  |  |
| - Leaves and Grass (3\%, 26,201 tons) |  |  |  |  |  |  |  |  |  |

For sampling, this group was divided into two subgroups: "Ambulatory Health Care Services" and "Hospital, Nursing, and Residential Care Facilities." In addition to normalizing generation on a per employee basis (TPEPY) for the group as a whole, the project team normalized generation for the latter subgroup by the number of beds at each generator site. As shown in Table 51, Hospital, Nursing, and Residential Care Facilities in Group 8 generated an estimated 0.57 tons per bed per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 51. Generation Rate Summary by Weight: Medical \& Health (tons per bed per year)

| Tons per Bed per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Hospital, Nursing, \& Residential <br> Care Facilities | 0.52 | 0.03 | 0.01 | 0.01 | $\mathbf{0 . 5 7}$ |

Figure 32 presents the annual tons for each stream in Group 8. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 91 percent of Group 8 generation went to the Disposed stream.

Figure 32. Annual Tons by Waste Stream: Medical \& Health

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 33 breaks down the potential recoverability (by recoverability group) for each stream in Group 8. As shown, Compost/Mulch and Other Materials each accounted for approximately 40 percent of the Disposed stream.

The Group 8 Curbside Recycle contamination rate was 7 percent, and the Curbside Organics contamination rate was 21 percent.

Figure 33. Recoverability by Stream: Medical \& Health

Figure 34 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 34 illustrates, approximately 39 percent of total generation in Group 8 went to the Other Materials recoverability group. This is the only industry group in which Other Materials is the largest recoverability group, mainly due to a large amount of Remainder/Composite Organic materials, including diapers and other organic waste not typically recovered, that was generated. When combined, divertible materials accounted for roughly 61 percent of the Group 8 generation, the lowest diversion potential of any industry group. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 34. Recoverability of Materials Generated in the Medical \& Health Sector

Table 52 presents detailed composition results for each stream in Group 8, as well as for the total group generation.

Table 52. Composition Summary: Medical \& Health

| Material | Disposed |  | Curbside Recycle |  | Curbside Organics Est. \% Est. Tons |  | Other Diversion |  | Total Generation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Findings for Public Administration

The Public Administration industry group's 0.39 TPEPY was the lowest total generation rate of all industry groups. Statewide, Group 9 disposed of more than 259,000 tons and diverted more than 50,000 tons. Group 9 disposed of nearly 45,000 tons of food in 2013, making it the most prevalent divertible material type in the Group 9 Disposed stream. Group 9 included all public sector sites such as local government buildings and police and fire stations, but it did not include schools (public or private). Table 53 presents key findings for Group 9.

Table 53. Key Findings and Metrics: Public Administration

| Public Administration |  |  |  |  |
| :--- | :--- | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| • Food (17\%, 44,508 tons) |  |  |  |  |
| - Remainder/Composite Paper - Compostable (14\%, 37,208 tons) |  |  |  |  |
| - Clean Pallets \& Crates (5\%, 13,416 tons) |  |  |  |  |

The Disposed stream makes up 84 percent of total generation in Group 9, as illustrated in Figure 35. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins.

Figure 35. Annual Tons by Waste Stream: Public Administration

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 36 breaks down the potential recoverability (by recoverability group) for each stream in Group 9. As shown, approximately threequarters of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 9 Curbside Recycle contamination rate was 7 percent, and the Curbside Organics contamination rate was 8 percent.

Figure 36. Recoverability by Stream: Public Administration

Figure 37 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 37 illustrates, approximately 36 percent of total generation in Group 9 was material in the Compost/Mulch recoverability group. Curbside Recyclable and Other Materials accounted for approximately 28 percent and 26 percent of Group 9 total generation, respectively. When combined, divertible materials accounted for nearly three-quarters of the Group 9 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 37. Recoverability of Materials Generated in the Public Administration Sector

Percentage reflects the proportion of industry group generation

Table 54 presents detailed composition results for each stream in Group 9, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Restaurants

Table 55 presents key findings for the Restaurants industry group (Group 10). Statewide, Group 10 disposed of nearly 2.9 million tons and diverted nearly 618,000 tons. The total generation rate was approximately 2.92 TPEPY. Food is the most prevalent divertible material type in the Group 10 Disposed stream, accounting for 51 percent of disposal.

Table 55. Key Findings and Metrics: Restaurants

| Restaurants |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |  |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |  |
| - Food (51\%, 1,461,319 tons) |  |  |  |  |  |
| - Remainder/Composite Paper - Compostable (12\%, 350,240 tons) |  |  |  |  |  |
| - Newspaper (3\%, 76,093 tons) |  |  |  |  |  |

Figure 38 presents the annual tons for each stream in Group 10. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 82 percent of total generation at Group 10 businesses went to the Disposed stream.

Figure 38. Annual Tons by Waste Stream: Restaurants

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 39 breaks down the potential recoverability (by recoverability group) for each stream in Group 10. As shown, more than 80 percent of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 10 Curbside Recycle contamination rate was 15 percent, and the Curbside Organics contamination rate was 10 percent.

Figure 39. Recoverability by Stream: Restaurants

Figure 40 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 40 illustrates, approximately 61 percent of total generation in Group 10 was material in the Compost/Mulch recoverability group, and approximately 22 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 84 percent of the Group 10 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 40. Recoverability of Materials Generated in the Restaurants Sector

Table 56 presents detailed composition results for each stream in Group 10, as well as for the total group generation.

Table 56. Composition Summary: Restaurants

[^2]
## Findings for Retail Trade - Food \& Beverage Stores

Table 57 presents key findings for the Retail Trade - Food \& Beverage Stores industry group (Group 11). Statewide, Group 11 disposed of nearly 418,000 tons and diverted nearly 1.9 million tons, which worked out to an 82 percent diversion rate and 6.64
TPEPY. Group 11 had both the highest diversion rate and the highest generation rate among all industry groups. Food was the most prevalent divertible material type in the Group 11 Disposed stream, accounting for 42 percent of disposal. Among all the industry groups, Group 11 diverted the most material, by weight.

Table 57. Key Findings and Metrics: Retail Trade - Food \& Beverage Stores

## Retail Trade - Food \& Beverage Stores

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| :---: | :---: | :---: | :---: | :---: |
| 1.21 | 5.43 | 417,791 | $1,868,403$ | $82 \%$ |

## Top Three Diversion Opportunities in Disposed Stream

- Food (42\%, 173,504 tons)
- Remainder/Composite Paper - Compostable (9\%, 37,501 tons)
- Other Miscellaneous Paper - Other (3\%, 13,492 tons)

Figure 41 presents the annual tons for each stream in Group 11. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, more than three-quarters of total generation at Group 11 businesses went to the Other Diversion stream. Group 11 businesses reported backhauling and selling directly to commodity markets large quantities of both uncoated corrugated cardboard and food. The high proportion of Other Diversion, and the high overall diversion and generation rates, are primarily due to these activities.

Figure 41. Annual Tons by Waste Stream: Retail Trade - Food \& Beverage Stores

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 42 breaks down the potential recoverability (by recoverability group) for each stream in Group 11. As shown, approximately threequarters of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 11 Curbside Recycle contamination rate was 24 percent, and the Curbside Organics contamination rate was 2 percent.

Figure 42. Recoverability by Stream: Retail Trade - Food \& Beverage Stores

Figure 43 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 43 illustrates, approximately 56 percent of total generation in Group 11 was material in the Curbside Recyclable recoverability group, and approximately 38 percent was Compost/Mulch. When combined, divertible materials accounted for roughly 95 percent of the Group 11 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 43. Recoverability of Materials Generated in the Retail Trade - Food \& Beverage Stores Sector

Table 58 presents detailed composition results for each stream in Group 11, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Retail Trade - All Other

Table 59 presents key findings for the Retail Trade - All Other industry group (Group 12). Statewide, Group 12 disposed of more than 2.4 million tons and diverted approximately 306,000 tons. Total generation was approximately 2.41 TPEPY. Food was the most prevalent divertible material type in the Group 12 Disposed stream, accounting for 18 percent of disposal.

Table 59. Key Findings and Metrics: Retail Trade - All Other

| Retail Trade - All Other |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |  |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |  |
| - Food (18\%, 437,469 tons) |  |  |  |  |  |
| - Remainder/Composite Paper - Compostable (9\%, 209,655 tons) |  |  |  |  |  |
| - Clean Pallets \& Crates (6\%, 135,886 tons) |  |  |  |  |  |

The Disposed stream accounted for approximately 89 percent of Group 12 generation. Figure 44 presents the annual tons for each stream in Group 12. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins.

Figure 44. Annual Tons by Waste Stream: Retail Trade - All Other

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 45 breaks down the potential recoverability (by recoverability group) for each stream in Group 12. As shown, approximately two-thirds of the Disposed stream was divertible, mostly Compost/Mulch materials.

The Group 12 Curbside Recycle contamination rate was 18 percent. The study did not include any sites from this group with Curbside Organics.

Figure 45. Recoverability by Stream: Retail Trade - All Other

Figure 46 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 46 illustrates, one-third of total generation in Group 12 was material in the Compost/Mulch recoverability group, and approximately 30 percent was Other Materials. When combined, divertible materials accounted for roughly 70 percent of the Group 12 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 46. Recoverability of Materials Generated in the Retail Trade - All Other Sector

Table 60 presents detailed composition results for each stream in Group 12, as well as for the total group generation.

Table 60. Composition Summary: Retail Trade - All Other

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Services - Management, Administrative, Support, \& Social

Table 61 presents key findings for the Services - Management, Administrative, Support, \& Social industry group (Group 13). Statewide, Group 13 disposed of more than 1.5 million tons and diverted more than 1.4 million tons. Total generation was approximately 1.44 TPEPY. Food was the most prevalent divertible material type in the Group 13 Disposed stream, accounting for 25 percent of disposal.

Table 61. Key Findings and Metrics: Services - Management, Administrative, Support, \& Social
Services - Management, Administrative, Support, \& Social

Key Findings and Metrics

| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| :---: | :---: | :---: | :---: | :---: |
| 0.74 | 0.70 | $1,514,667$ | $1,417,462$ | $48 \%$ |

Top Three Diversion Opportunities in Disposed Stream

- Food (25\%, 376,502 tons)
- Remainder/Composite Paper - Compostable (11\%, 164,498 tons)
- Leaves and Grass (6\%, 86,284 tons)

For Group 13, in addition to normalizing generation on a per employee basis (TPEPY), the project team normalized generation by the estimated amount of office space occupied by each generator site. As shown in Table 62, Group 13 businesses generated an estimated 2.83 tons per thousand square feet of office space per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 62. Generation Rate Summary by Weight: Services - Management, Administrative, Support, \& Social (tons per 1,000 sq. ft. per year)

| Tons per 1,000 Sq. Ft. per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Services - Management, <br>  <br> Social | 1.18 | 0.20 | 1.41 | 0.04 | 2.83 |

Figure 47 presents the annual tons for each stream in Group 13. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means, such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. Curbside Organics are 40 percent of total generation in Group 13. This group includes property management agencies and landscapers, some of whom haul grass and prunings collected on the job to a central yard, where they are collected as part of the business' Curbside Organics stream.

Figure 47. Annual Tons by Waste Stream: Services - Management, Administrative, Support, \& Social

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 48 breaks down the potential recoverability (by recoverability group) for each stream in Group 13. As shown, Compost/Mulch materials accounted for almost half of the Disposed stream.

The Group 13 Curbside Recycle contamination rate was 30 percent. No contamination was observed in the Curbside Organics stream.

Figure 48. Recoverability by Stream: Services - Management, Administrative, Support, \& Social

Figure 49 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 49 illustrates, approximately 66 percent of total generation in Group 13 was material in the Compost/Mulch recoverability group, and approximately 15 percent was Other Materials. When combined, divertible materials accounted for roughly 85 percent of the Group 13 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 49. Recoverability of Materials Generated in the Services - Management, Administrative, Support, \& Social Sector

Table 63 presents detailed composition results for each stream in Group 13, as well as for the total group generation.

Table 63. Composition Summary: Services - Management, Administrative,
Support, \& Social

| Material | Disposed |  | Curbside Recycle |  | Curbside Organics |  | Other Diversion |  | Total Generation |  |

## Findings for Services - Professional, Technical, \& Financial

Table 64 presents key findings for the Services - Professional, Technical, \& Financial industry group (Group 14). Example business types in this group include banks, real estate agencies, architecture firms, and engineering companies. Statewide, the Group 14 total generation rate is 2.31 TPEPY. With more than 2.1 million employees (the most of any industry group), this group disposed of nearly 4 million tons and diverted nearly 950,000 tons. Group 14 accounted for approximately 19 percent of the overall commercial sector generation, making it the largest generator in the state. This group disposed of nearly 396,000 tons of remainder/composite paper - compostable, the most prevalent divertible material type in the Group 14 Disposed stream.

Table 64: Key Findings and Metrics: Services - Professional, Technical, \& Financial

| Services - Professional, Technical, \& Financial |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed TPEPY | Diverted | Disposed | Diverted | Diversion |
| TPEPY | TPEPY | Tons | Tons | Rate |
| 1.86 | 0.44 | 3,994,643 | 949,869 | 19\% |
| Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Remainder/Composite Paper - Compostable (10\%, 395,521 tons) <br> - Clean Pallets \& Crates ( $8 \%, 332,687$ tons) <br> - Food ( $8 \%, 330,452$ tons) |  |  |  |  |

In addition to normalizing generation on a per employee basis (TPEPY), the project team normalized generation by the estimated amount of office space occupied by each generator site. As shown in Table 65, Group 14 businesses generated an estimated 2.37 tons per thousand square feet of office space per year. The number of sites used in this calculation is noted in Table 98 in Appendix C: Description of Calculations.

Table 65: Generation Rate Summary by Weight: Professional, Technical, \& Financial (tons per 1,000 Sq. Ft. per year)

| Tons per 1,000 Sq. Ft. per Year | Disposed | Curbside <br> Recycle | Curbside <br> Organics | Other <br> Diversion | Generation |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Services - Professional, <br> Technical, \& Financial | 2.01 | 0.29 | 0.01 | 0.05 | $\mathbf{2 . 3 7}$ |

Figure 50 presents the annual tons for each stream in Group 14. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means, such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams, such as food in recycling bins or glass in organics bins. As shown, approximately 81 percent of total generation in Group 14 went to the Disposed stream.

Figure 50. Annual Tons by Waste Stream: Services - Professional, Technical, \& Financial

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 51 breaks down the potential recoverability (by recoverability group) for each stream in Group 14. As shown, more than one-third of the Disposed stream was Compost/Mulch materials.

The Group 14 Curbside Recycle contamination rate was 11 percent, and the Curbside Organics contamination rate was 1 percent.

Figure 51. Recoverability by Stream: Services - Professional, Technical, \& Financial

Figure 52 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 52 illustrates, approximately 35 percent of total generation in Group 14 was material in the Compost/Mulch recoverability group, and approximately 28 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 75 percent of the Group 14 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 52. Recoverability of Materials Generated in the Services - Professional, Technical, \& Financial Sector

Table 66 presents detailed composition results for each stream in Group 14, as well as for the total group generation.

Table 66. Composition Summary: Services - Professional, Technical, \& Financial

| Material | Disposed |  | Curbside Recycle |  | Curbside Organics |  | Other Diversion |  | Total Generation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Services - Repair \& Personal

Table 67 presents key findings for the Services - Repair \& Personal industry group (Group 15). Statewide, Group 15 disposed of more than 281,000 tons and diverted nearly 171,000 tons. Generation was approximately 1.50 TPEPY. Remainder/composite paper - compostable was the most prevalent divertible material type in the Group 15 Disposed stream, accounting for 9 percent of disposal. Combined, other ferrous and other non-ferrous accounted for nearly three-quarters of the Group 15 Other Diversion stream.

Table 67. Key Findings and Metrics: Services - Repair \& Personal

| Services - Repair \& Personal |  |  |  |  |  |
| :--- | :--- | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |  |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |  |
| Remainder/Composite Paper - Compostable (9\%, 24,506 tons) |  |  |  |  |  |
| - Food (7\%, 20,927 tons) |  |  |  |  |  |
| - Uncoated Corrugated Cardboard (5\%, 15,017 tons) |  |  |  |  |  |

As shown in Figure 53, the three diversion streams accounted for approximately 38 percent of total generation in Group 15, with the remaining 62 percent in the Disposed stream. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins.

Figure 53. Annual Tons by Waste Stream: Services - Repair \& Personal

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 54 breaks down the potential recoverability (by recoverability group) for each stream in Group 15. As shown, almost two-thirds of the Disposed stream was divertible, nearly evenly split between Curbside Recyclable, Compost/Mulch, and Other Recyclable materials.

The Group 15 Curbside Recycle contamination rate was 18 percent. No contamination was observed in the Curbside Organics stream.

Figure 54. Recoverability by Stream: Services - Repair \& Personal

Figure 55 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 55 illustrates, approximately 32 percent of total generation in Group 15 was material in the Compost/Mulch recoverability group. The Curbside Recyclable, Other Recyclable, and Other Materials groups each accounted for slightly more than 20 percent of total generation. When combined, divertible materials accounted for roughly 78 percent of the Group 15 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 55. Recoverability of Materials Generated in the Services - Repair \& Personal Sector

Table 68 presents detailed composition results for each stream in Group 15, as well as for the total group generation.

## Findings for Not Elsewhere Classified

Table 69 presents key findings for the Not Elsewhere Classified industry group (Group 16). This group consists of industries with less employment or atypical waste streams that may be less likelihood to be targeted for diversion programs, such as agriculture, utilities, and transportation. Statewide, Group 16 disposed of nearly 539,000 tons and diverted more than 750,000 tons. Generation was approximately 1.20 TPEPY. Food was the most prevalent divertible material type in the Group 16 Disposed stream, accounting for 16 percent of disposal.

Table 69. Key Findings and Metrics: Not Elsewhere Classified

| Not Elsewhere Classified |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed <br> TPEPY | Diverted <br> TPEPY | Disposed <br> Tons | Diverted <br> Tons | Diversion <br> Rate |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Food (16\%, 86,197 tons) |  |  |  |  |
| - Remainder/Composite Paper - Compostable (9\%, 48,398 tons) |  |  |  |  |
| - Leaves and Grass (6\%, 30,678 tons) |  |  |  |  |

Figure 56 presents the annual tons for each stream in Group 16. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins, and materials diverted through other means, such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. Other Diversion was the largest stream ( 53 percent), and the Disposed stream accounted for an additional 42 percent of Group 16 generation.

Figure 56. Annual Tons by Waste Stream: Not Elsewhere Classified

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 57 breaks down the potential recoverability (by recoverability group) for each stream in Group 16. As shown, the Other Diversion stream was approximately 81 percent Compost/Mulch, and nearly three-quarters of the Disposed stream was divertible.

The Group 16 Curbside Recycle contamination rate was 13 percent. No contamination was observed in the Curbside Organics stream.

Figure 57. Recoverability by Stream: Not Elsewhere Classified

Figure 58 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 58 illustrates, approximately 62 percent of total generation in Group 16 was material in the Compost/Mulch recoverability group, and approximately 15 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 87 percent of the Group 16 generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 58. Recoverability of Materials Generated in the Not Elsewhere Classified Sector

Table 70 presents detailed composition results for each stream in Group 16, as well as for the total group generation.

Tables detailing the composition for all 82 materials can be found in Appendix E: Detailed Composition Tables

## Findings for Multi-Family

Table 71 presents key findings for the Multi-Family group. Statewide, Multi-Family disposed of more than 2.5 million tons and diverted approximately 460,000 tons. The Multi-Family generation rate was approximately 0.87 tons per unit per year (TPUPY). Food was the most prevalent divertible material type in the Multi-Family Disposed stream, accounting for 25 percent of disposal.

Multi-Family estimates did not take into account any diversion (e.g., recycling of computer equipment, furniture, etc.) done by tenants of the multi-family complex independently of the buildings' management and custodial services.

Table 71. Key Findings and Metrics: Multi-Family

| Multifamily |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Key Findings and Metrics |  |  |  |  |
| Disposed TPUPY | Diverted TPUPY | Disposed Tons | Diverted <br> Tons | Diversion Rate |
| 0.74 | 0.13 | 2,524,183 | 460,083 | 15\% |
| Top Three Diversion Opportunities in Disposed Stream |  |  |  |  |
| - Food ( $25 \%, 625,274$ tons) <br> - Textiles (7\%, 188,044 tons) <br> - Remainder/Composite Paper - Compostable (7\%, 170,875 tons) |  |  |  |  |

Figure 59 presents the annual tons generated by each stream in Multi-Family. This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, curbside organics bins, and materials diverted through other means such as businesses selling their own cardboard or scrap metal directly to recyclers. The Curbside Recycle and Curbside Organics quantities include the contaminationmaterials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 85 percent of total generation in MultiFamily went to the Disposed stream.

Figure 59. Annual Tons by Waste Stream: Multi-Family

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. Table 95 in Appendix B: Material Definitions details the assignment of material types to recoverability groups. Figure 60 breaks down the potential recoverability (by recoverability group) for each stream in Multi-Family. As shown, nearly three-quarters of the Disposed stream was divertible.

The Multi-Family Curbside Recycle contamination rate was 27 percent, and the Curbside Organics contamination rate was less than 1 percent.

Figure 60. Recoverability by Stream: Multi-Family

Figure 61 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream; i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 61 illustrates, approximately 34 percent of total generation in Multi-Family was material in the Compost/Mulch recoverability group, and approximately 29 percent was Curbside Recyclable. When combined, divertible materials accounted for roughly 75 percent of the Multi-Family generation. Table 95 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups.

Figure 61. Recoverability of Materials Generated in the Multi-Family Sector

Table 72 presents detailed composition results for each stream in Multi-Family, as well as for the total group generation.

Table 72. Composition Summary: Multi-Family

## Additional Analyses Results

Task 3 Analysis - Assessment of Commercial Curbside Diversion
In 2012 California's Mandatory Commercial Recycling (MCR) law went into effect, requiring businesses to take actions to divert materials from disposal. Businesses can meet the law by source-separating materials and having them delivered for recycling or composting. They can also meet the law by subscribing to a service that may include mixed-waste processing (i.e. recyclables are not separated and the entire waste stream is processed), as long as the results are comparable to source separation. In order to determine what's comparable to source separation, an assessment of that source separation is needed.

The goal of this task was to gain a better understanding of diversion from curbside source-separation systems for the commercial sector in general.

This was done by gathering data on materials placed in recycling and organics bins by businesses that subscribe to these services. This data was then combined with data on materials placed in disposal bins (Task 2 of the project) to get a comprehensive picture of the amounts of recoverable materials flowing to disposal and diversion through binbased programs.

This data can be used to set a benchmark that mixed-waste processing should meet in order to be "comparable to source separation." Other diversion through non-curbside programs that occurs at businesses can happen whether the business uses recycling bins or mixed-waste processing; therefore, this other diversion stream was not included in the analysis. Only materials placed in bins that would be processed by a "clean" MRF (i.e., processes source-separated materials) or by an organics processing facility were included in this task.

This task assessed curbside diversion for the commercial sector as a whole, not by individual industry group. Since the law includes multi-family sites, this sector was included in the analysis. The Task 3 analysis includes quantity and composition data from only the sites with curbside diversion used in Task 2 (the generator-based disposal study) and Task 4 (the generator-based diversion study). The subset of generator sites included in the Task 3 analysis has different characteristics than the sites selected to participate in Task 4. The main difference is that all Task 3 sites have curbside diversion programs, but some Task 4 sites only have non-curbside diversion programs on-site. The distribution of samples between regions and industry groups in the two tasks is also different.

Figure 62 presents the annual tons generated by each stream for the businesses included in the Task 3 analysis (Task 3 Generators). This figure summarizes the quantity of materials placed in disposal bins, curbside recycling bins, and curbside organics bins. The Curbside Recycle and Curbside Organics quantities include the contamination-materials not typically acceptable in those streams such as food in recycling bins or glass in organics bins. As shown, approximately 75 percent of total generation at Task 3 Generators went to the Disposed stream.

Figure 62. Annual Tons by Waste Stream: Task 3 Generator Sites

Percentage reflects the proportion of overall commercial sector and multifamily generation

Each material stream was composed of many different material types, and each of those material types was assigned to one of the five recoverability groups. This figure, unlike similar figures elsewhere in the report, considers the contamination level when assigning a material to a recovery group. Table 96 in Appendix B: Material Definitions details the assignment of material types to recoverability groups for this figure. Figure 63 breaks down the potential recoverability (by recoverability group) for each stream for Task 3 Generators.

As shown, more than two-thirds of the Disposed stream was divertible. For Task 3 Generators, the Curbside Recycle contamination rate was 25 percent, and the Curbside Organics contamination rate was approximately 1 percent.

Figure 63. Recoverability by Stream: Task 3 Generator Sites
$■$ Curbside Recyclable ■ Compost/Mulch ■Other Recyclable Recoverable Inerts © Other Materials

Figure 64 summarizes each recoverability group's proportion of total generation. In this figure, the Compost/Mulch quantity is the sum of the Compost/Mulch quantities in each stream, i.e., the sum of the green bars in the previous figure equals the green bar in this figure. The same holds true for each of the other recoverability groups. As Figure 64 illustrates, approximately 52 percent of total generation for Task 3 Generators was material in the Compost/Mulch recoverability group, and approximately 24 percent was Other Materials. When combined, divertible materials accounted for roughly 76 percent of generation for Task 3 Generators. This figure, unlike similar figures elsewhere in the report, considers the contamination level when assigning a material to a recovery group. Table 96 in Appendix B: Material Definitions summarizes the assignment of material types to recoverability groups for this figure.

Figure 64. Recoverability of Materials Generated by Task 3 Generator Sites

As part of the Task 3 analysis, the field crew performed a more detailed sort of the Disposed, Curbside Recycle, and Curbside Organics stream samples obtained from some generators. The purpose of the contamination subsort was to estimate the fraction of the sorted materials that a MRF or organics processor could recover, recognizing that, due to contamination, not all "recoverable" material arriving at a facility is in a condition that permits its recovery. The field crew collected additional detail on the level and the source of contamination for certain materials on these samples. The 20 materials included in the contamination subsort are listed in Table 73. These materials are commonly accepted in curbside recycling programs. They also were included in the contamination subsort in CalRecycle's California 2008 Statewide Waste Characterization Study.

Table 73. Materials Included in the Contamination Subsort

| Paper | Metal |
| :--- | :--- |
| Uncoated Corrugated Cardboard | Tin/Steel Cans - CRV Bimetal Containers |
| Paper Bags | Tin/Steel Cans - Other |
| Newspaper | Aluminum Cans - CRV |
| White Ledger | Aluminum Cans - Non-CRV |
| Other Office Paper | Plastic |
| Other Miscellaneous Paper - Compostable | PETE Containers - CRV |
| Other Miscellaneous Paper - Other | PETE Containers - Non-CRV |
| Remainder/Composite Paper - Rigid Food and Beverage Cartons | HDPE Containers - CRV |
| Remainder/Composite Paper - Compostable | HDPE Containers - Non-CRV |
| Remainder/Composite Paper - Other | Miscellaneous Plastic Containers (\#3-\&7) - CRV |
|  | Miscellaneous Plastic Containers (\#3-\&7) - Non-CRV |

The field crew assessed the level of contamination for these 20 materials using the following guidelines:

Clean. Material not soiled or contaminated in the bin that could reasonably be expected to be recycled in recycling programs targeting the material without special processing, cleaning, and/or repair. For example, a clean plastic soda bottle, dry office paper, or a clean, dry, and still folded newspaper.

Figure 65. Clean Materials

Bin-Contaminated. Material that appears to have been contaminated after disposal. Typically these materials are contaminated with moisture or food, such as a newspaper wet from a leaked beverage, a plastic soda bottle covered with food on the outside, or a bottle or can covered in grass clippings.

Figure 66. Bin-Contaminated Materials

Figure 67. Source-Contaminated Materials

The field crew did not subsort magazines and catalogs or phone books and directories. The contaminated portion of these materials was calculated by applying the contaminated portion from the other subsorted Curbside Recyclable paper material types to the magazines and catalogs and phone books and directories quantities on a sample by sample basis. The composition and quantity data for Task 3 generator sites, including the contamination subsort detail, is included at the end of Appendix E :
Detailed Composition Tables.

To estimate the proportion of commercial-sector generation actually recovered through curbside programs, the project team split the 82 material types considered for this study into two groups: standard recoverable materials and all other materials.

- Standard Recoverable Materials: materials that are accepted in most Curbside Recycle or Curbside Organics programs around the state, based on research done by CalRecycle on materials listed as acceptable in local jurisdiction programs.
- All Other Materials: all materials that are not included in the list of standard recoverable materials.

The two groups were correlated with the contamination subsort data to estimate the curbside recovery rate. Table 74 lists the standard recoverable materials and their recoverability for the Task 3 analysis. Materials marked with an X are considered recovered for the purposes of the analysis.
As shown in Table 75, approximately 21 percent of the material generated at businesses and multi-family complexes is recovered through curbside diversion programs capturing the standard recoverable materials.

Table 74. Standard Recoverable Materials for Task 3 Analysis

|  | Curbside Recycle Bins |  |  | Curbside Organics Bins |  |  |

| Statewide Total for Businesses and Multifamily Complexes with Curbside Diversion | 5,246,840 | 534,172 | 6,751,774 | 1,977,196 | 64,305 | 407,836 | 1,702,125 | 6,800 | 6,984 | 3,537,852 | 16,698,032 | 21.2\% |

* These materials were not subsorted for contamination. All glass containers, food, leave and grass, and prunings and trimmings are assumed to be recovered if in the appropriate bin.
**These are materials that are not typically recoverable and most of these materials were not subsorted for contamination.

## Recruitment Survey Questions

During the recruitment process, recruitment staff asked businesses several survey questions about other waste diversion and reduction practices, waste scavenging, and their knowledge of California's Mandatory Commercial Recycling (MCR) law.

Recruitment staff asked businesses about their participation in five waste reduction activities: a waste exchange, used equipment or edible food donation, ink or toner cartridge recycling, and converting from paper towels to hand dryers. The responses are summarized in in Table 76.

Table 76. Survey Responses for Partipation in Waste Reduction Activites

| Proportion of businesses that reported participating in a waste <br> exchange: | $1 \%$ |
| :--- | :---: |
| Proportion of businesses that reported donating used <br> equipment: | $13 \%$ |
| Proportion of food-related businesses* that reported donating <br> leftover food: | $17 \%$ |
| Proportion of businesses that reported recycling ink and toner <br> cartridges: | $50 \%$ |
| Proportion of businesses that reported converting from paper <br> towels to hand dryers: | $7 \%$ |

* Includes Group 3 (Education), Group 4 (Hotels and Lodging), Group 6
(Manufacturing - Food and Nondurable Wholesale), Group 10 (Restaurants), and Group 11 (Retail Trade - Food and Beverage Stores).

Recruitment staff also asked businesses and multi-family complexes if their waste or recycling containers were scavenged for recoverable materials. As illustrated in Table 77, about 23 percent of businesses reported that their containers were occasionally or regularly scavenged. Similarly, 21 percent of multi-family complexes reported occasional or regular occurrences of scavenging. Businesses reported that the common materials targeted for scavenging included aluminum cans, plastic bottles, cardboard, and pallets. Many businesses also reported that employees will informally collect cans and bottles for redemption. When discussing scavenging, many businesses mentioned they also have regular occurrences of illegal dumping.

Table 77. Survey Responses for Scavenging

| Businesses that reported outside scavenging of disposal or <br> recycling containers: | $23 \%$ |
| :--- | :---: |
| Multi-family complexes that reported outside scavenging of <br> disposal or recycling containers: | $21 \%$ |

When recruitment staff asked businesses if they were aware of the state requirements for mandatory commercial recycling, about 12 percent of businesses reported knowing
about these requirements. Of these businesses, a little over 44 percent reported that they changed their recycling practices or pickup service as a result of these requirements. These results are also reported in Table 78.

## Table 78. Survey Responses for MCR

| Businesses that reported knowing about MCR: | $12 \%$ |
| :--- | :--- |
| Proportion of these that reported changing their recycling <br> practices: | $44 \%$ |

## Weight-Based Disposal Rate Study

The goal of the weight-based disposal rate study was to design and conduct a study that would provide CalRecycle with an alternative method for estimating waste disposal rates at businesses. Disposal rate data collection for this study was different from the Task 2 disposal rate data collection in two ways: 1) the project team weighed entire dumpsters rather than only portions of materials as in Task 2; and 2) the project team used a bin-fullness sensor system, Enevo ${ }^{\text {TM }}$, to track collection events. The Enevo ${ }^{\text {TM }}$ system uses wireless sensors that are installed in waste containers to detect bin fullness and record collection events. Each sensor sends this data over wireless cellular networks to the Enevo ${ }^{\text {TM }}$ servers to populate a visualization system that is accessible online.

This section presents the methods and results of this study and comparisons to the results of Task 2.

## Summary of Methods

## Selection and Recruitment Process

The weight-based disposal rate study was carried out in six jurisdictions where the local hauler approved installing Enevo ${ }^{\text {TM }}$ sensors in their containers over the course of the study. The study included two jurisdictions in each of the Bay Area, Southern, and Central Valley regions. This study focused on four businesses groups: Manufacturing All Other; Restaurants; Retail Trade - All Other; and Services - Professional, Technical, \& Financial.

The project team recruited individual businesses for participation in this weight-based disposal rate study using many of the same methods and tools used to recruit businesses for Task 2, though the sites used for the test did not participate in Task 2. The project team contacted each business to confirm eligibility and to collect employment data, operational hours, and collection schedules.

## Site Visits

Project team field staff collected weight and volume measurements at each of the selected businesses over a two-week period in February and March of 2015. During this period, field staff:

- Installed Enevo ${ }^{\text {TM }}$ sensors in all of the garbage dumpsters at each participating business.
- Used a pallet jack to weigh garbage dumpsters right before collection events. Field staff visited selected sites two to three times to take separate weight measurements. Field staff also weighed empty dumpsters to get a weight that the project team could subtract from the total weight of the full dumpster and generate the true weight of material in the dumpster.
- Recorded the length, width, and height of all accumulated material to the nearest inch each time a container was weighed.

## Calculations

The project team estimated annual tonnage for each site included in this study using a weight-based disposal rate. We calculated this rate by dividing the weight of waste material (determined using a pallet jack with an integrated scale) by the hours of operation since the last collection event recorded by the Enevo ${ }^{\text {TM }}$ system. We then multiplied this rate by annual hours of operation at the business to estimate annual tons.

We estimated the tons per employee per year, TPEPY, yards per employee per year, YPEPY, and average waste densities using the same calculations as in Task 2, which are presented in Appendix C: Description of Calculations.

## Results

Table 79 compares the results of the Task 2 study (Method 1) to the results of the weight-based disposal study (Method 2). The comparison is based on the results at 183 Task 2 sites and 131 sites sampled as part of the weight-based disposal study. Task 2 sites included in this comparison are businesses from one of the four targeted business groups and located in the Bay Area, Southern, or Central Valley region. The YPEPY estimates from Method 2 are lower than the estimates from Method 1 for all industry groups. The TPEPY estimates from Method 2 are also lower in all but one group, Restaurants. The Manufacturing - All Other and Restaurant density estimates from Method 2 are higher than the Method 1 density estimates. Method 2 density estimates for the other two industry groups are lower than their Method 1 estimates.

Table 79. Comparison of Task 2 and Weight-Based Disposal Study Results, by Group

|  | Sampled Sites |  | Density |  | Cubic Yards per Empl. per Year |  | Tons perEmpl. per Year |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Method 1 | Method 2 | Method 1 | Method 2 | Method 1 | Method 2 | Method 1 | Method 2 |
| Manufacturing - All Other | 46 | 34 | 87.96 | 97.67 | 10.9 | 1.7 | 0.48 | 0.28 |
| Restaurants | 46 | 34 | 149.12 | 157.83 | 27.4 | 16.9 | 2.04 | 2.37 |
| Retail Trade - All Other | 47 | 33 | 142.10 | 99.22 | 29.7 | 18.6 | 2.11 | 1.15 |
| Services - Professional, Technical, \& Financial | 44 | 30 | 180.21 | 144.70 | 15.9 | 6.7 | 1.44 | 0.70 |

Figure 68 presents the estimated TPEPY for the individual businesses sampled for Method 1 and Method 2 as a box and whisker plot. The bars represent the range of the second and third quartile TPEPYs, separated by a line representing the median value. The whiskers extending from the boxes mark the minimum TPEPY and interquartile range. Possible outliers are indicated with gray circles.

The box plot suggests that Method 2 TPEPY estimates are more representative than Method 1 TPEPY estimates. Most significantly, Method 2 TPEPY estimates for three out of the four business groups have a more normal distribution over the quartiles. Also for three out of the four business groups, Method 2 TPEPY estimates fall within a smaller interquartile range. Similarly, Method 2 consistently generated few outliers, which all occurred within a smaller range than Method 1 TPEPY estimates.

Figure 68. Business TPEPY Quartiles Comparisons of Task 2 and the WeightBased Disposal Study

These results for Method 2 can be attributed to a more robust data collection system. For Method 2, the field crew collected multiple weight and volume measurements for each business compared to Method 1, which collected a single volume and weight measurement for each business. Method 2 accumulation period estimates are also more precise since they are based on actual bin collection times as recorded by the sensors, rather than estimated collection times reported by businesses. Finally, capturing weights of entire dumpsters both increases sample sizes and provides the information needed to directly estimate a weight based disposal rate, rather than converting volumes using density estimates.

## Appendix A: Detailed Methodology

## Overview

This Appendix is based on the document that served as the study design for the California Department of Resources Recycling and Recovery (CalRecycle) 2013-2014 Generator Waste Composition Study. This study design describes the methods that Cascadia Consulting Group (Cascadia) used to characterize and quantify disposal and diversion from individual commercial and multi-family generators statewide. The resulting quantification and characterization data provided CalRecycle with information about disposal and diversion activities among commercial and multi-family generators statewide and by industry group. Collecting composition and quantity data for each individual industry group provided information on sources of materials disposed and diverted by businesses and was useful in projecting future changes in the waste stream and developing relevant and effective education, outreach, and legislative strategies.

Cascadia followed a data collection strategy similar to that of the 1999 Statewide Waste Characterization Study and the 2006 Waste Disposal and Diversion Findings for Selected Industry Groups (the two most recent CalRecycle generator-based waste characterization studies). This study was divided into two major tasks:

- Task 2: Calculate industry group-specific data on the composition and quantity of disposed materials through sampling at 850 commercial and multifamily generator sites.
- Task 4: Calculate industry group-specific data on the composition and quantity of diverted materials through sampling of a 430-member subset of the commercial and multi-family generator sites recruited for the study. This task included any materials diverted through any method (including haulercollected recycling and organics bins, back-hauling, self-hauling, take-back programs, and other methods) that would normally be a part of the waste stream. It excluded diversion of hazardous materials; medical waste; manufacturing and process chemicals; fats, oils, and grease; industrial quantities of tires; and other items that aren't normally accepted for disposal at a landfill, except for e-waste. Though e-waste is banned from landfills, the study did characterize and quantify the diversion of these materials.

The study also included a special analysis on a 230-member subset of the Task 4 generator sites. This task, referred to throughout the study as Task 3, aimed to gather data on materials placed in recycling and organics bins by businesses. This was done in order to develop a general assessment of the amount of recoverable materials put in the multiple bins used in source-separation programs, and of the performance of these programs. Therefore, the Task 3 analysis was limited to the commercially collected diversion at these sites, i.e., materials placed in collection containers provided by haulers or recyclers, that were delivered to a recycling or organics processing facility that processes source-separated materials. The analysis excluded the items diverted through other methods including back-hauling, self-hauling, take-back programs, and other methods.

The rest of this section presents the included industry groups and regions and the planned generator site allocations and distributions, and compares the methodologies for each task.

Detailed recruitment, sampling, and characterization methodologies are presented in the Recruitment and Field Sampling/Sorting sections.

## Industry Groups and Regions Included

Cascadia collected data from commercial and multi-family generators for the study from the industry groups and regions defined here.

## Industry Groups

Cascadia recruited commercial generators from 16 industry groups as well as multifamily complexes. All industry groups included in this study are listed in Table 81. Groups were designed using the North American Industry Classification System (NAICS). Industry groups were designed with several factors in mind: grouping business types with similar waste generation profiles and purposes; focusing on industries that generate large amounts of organics; focusing on industries with large employment in California; combining industries with less employment or less diversion opportunities; and project budget. The construction industry group was not included in this study because waste associated with this industry was mainly generated at building sites rather than the site of the business office. Waste generated from construction activities and sites was captured in a separate disposal facility-based study by CalRecycle. Groups 8 and 16 were lumped groups: Samples were allocated to the listed subgroups, but results were reported at the group level. The three-digit NAICS codes corresponding to each of the 16 industry groups are listed in Table 80.

Table 80. NAICS Codes and Industry Groups

| Group Number | Included NAICS Codes | Industry | 2013 Statewide Employment |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

For each group, the number of employees in the Size Break column of Table 81 distinguished small businesses from large businesses. The size break was selected so that approximately 20 percent of employment in a group fell into small businesses and approximately 80 percent fell into large businesses. During recruitment, we attempted to obtain a 4:1 ratio between large businesses and small businesses for each industry group. This was a group level target; the ratio within each region or season may not be 4:1. Since small businesses often represent the majority of the number of businesses, but large businesses often represent the majority of employment in an industry group, this ensured each size class was properly represented. Very small businesses, those with fewer than five employees, were excluded from the study because they do not generate enough material weekly to meet the minimum sample weights and frequently share bins with other businesses, though the annual employment figures included employment at these small businesses. Multi-family complexes were defined as residences with more than four units. Residences with four or fewer units were not included in this study. Note: Disposal characterization data for multi-family sites was collected as part of the accompanying disposal facility-based study, but multi-family diversion characterization was part of this study.

## Regions

Cascadia recruited generators from the five regions illustrated in Figure 69. These were the same regions used in all CalRecycle waste characterization studies. See CalRecycle's 1999 Statewide Waste Characterization Study for background on how regions were developed.

Figure 69. Study Regions

The distinguishing characteristics of the five regions are described below.

- Coastal-included the counties on or near the coast that are not in either the Bay Area or Southern regions. The Coastal region is more populated than the rural Mountain region and has a large agricultural component similar to the Central Valley.
- Bay Area-included the counties in the San Francisco Bay Area, which are more metropolitan and have strong industrial components.
- Southern-included counties that are strongly industrial with large populations and some agricultural influences.
- Mountain-included counties that are primarily rural, with strong agricultural economies, low population density, and a low industrial base.
- Central Valley-included counties between the Sierra Nevada Mountains and the Coast Range that have a major agricultural base with important population centers and some manufacturing.

Table 82 lists the counties within each region.
Table 82. Division of the State's Counties into Five Sampling Regions

| Coastal | Bay Area | Southern | Mountain | Central Valley |

## Sample Allocations

Table 83 presents a high-level overview of the recruitment goals and requirements for each task. The recruitment process is detailed in the Recruitment section. Garbage samples were planned to be collected and sorted from all 850 sites. Diversion samples were planned to be collected and sorted from a 430-member subset of the 850 recruited sites. The sampling scheme was designed with the following ideas in mind: a focus on the disposed waste stream, in order to obtain robust data on materials still disposed; statistical variability of the streams (the diverted stream tends to be less variable); including an adequate number of sites to assess source separation for the commercial sector in general; and project logistics and budget constraints.

Table 83. Overview of Recruitment Goals

| Task | Number of Recruited Generator Sites Included in the Task | Site Requirements |
| :---: | :---: | :---: |
| 2 | All 800 business and 50 multifamily sites | Business sites must have more than five employees. Multifamily sites must have more than four units. All sites must dispose of at least 200 pounds of garbage per week. |
| 3 | 200 business and 30 multifamily sites | Sites must have recycling or organics collection service provided by a third party, typically a hauler or recycler. Sites are mostly a subset of the Task 4 sites. |
| 4 | 400 business and 30 multifamily sites | Sites with any method or level of diversion (including no diversion) are elegible for this task. Sites are a subset of the 850 recruited generators. |

Figure 70 illustrates the generator sites overlap between tasks. Sites included in the Task 3 special analysis were a subset of the sites included in Task 4. All Task 3 and Task 4 sites were a subset of the sites included in Task 2.

Figure 70. Recruitment Overlap between Tasks

## Task 3-200 business and 30

multifamily sites

## Task 4-400 business and 30 multifamily sites

## Task 2-800 business and 50 multifamily sites

Cascadia allocated samples approximately evenly among the four field seasons over 1 year, approximately corresponding to winter, spring, summer, and fall. During the sample allocation process, if samples did not split evenly (for example, when trying to split six samples across four seasons), Cascadia allocated samples randomly among the seasons to achieve a whole number distribution. Once the allocations were complete, if there were gross inequalities in the number of samples (for example, if one season was allocated 60 sites and the next was allocated 40 sites when they should each be allocated approximately 50 sites), then the project team reallocated individual sites to even out the distribution.

## Task 2 Garbage Sample Allocations

Cascadia allocated the 800 commercial generator sites evenly among the 16 industry groups with 50 generator sites per group. Samples were further allocated to regions within each industry group according to regional employment in that group as shown in Table 84. For example, the Bay Area region accounts for 18 percent of statewide employment in industry Group 6, therefore Cascadia recruited 18 percent of the samples for industry Group 6 from the Bay Area ( 18 percent * $50=9$ samples).

In addition to the 800 businesses recruited, the sample allocation included 50 multifamily sites, 10 from each region, as determined by the study design for the accompanying disposal facility-based study.

Table 84. Allocation and Distribution of Recruited Generator Sites

|  | Industry Group | Regions |  |  |  |  |  |

## Task 4 Recycling Sample Allocations

Cascadia allocated the 400 commercial generator sites evenly among the 16 industry groups, 25 generator sites per group. Samples were further allocated to regions within each industry group according to regional employment in that group. For example, the Bay Area region accounts for 18 percent of statewide employment in Group 6. Therefore, Cascadia recruited approximately 18 percent of the samples for industry Group 6 from the Bay Area ( 18 percent * $25=5$ samples). In addition, a total of 30 multi-family sites (six sites per region) were included in Task 4. Where employment proportions resulted in "partial samples" in a region, some discretion was used to assign
whole samples to groups and regions to best represent the employment for the industry group.

Cascadia randomly selected approximately 430 of the 850 recruited generator sites to participate in Task 4. The Task 4 site allocation and distribution is shown in Table 85.

Table 85. Allocation and Distribution of Sites Selected to Participate in Diversion Sampling

## Task 3 Special Analysis Allocations

Cascadia planned to randomly select 200 of the 800 recruited businesses for the Task 3 analysis. These approximately 200 businesses were a wholly contained subset of the businesses selected to participate in Task 4. The selected businesses had commercially collected, source-separated commercial recycling and/or organics diversion through bin service provided by a hauler or recycler. The number of businesses selected from each industry group and region were approximately proportional to statewide employment in each industry group and region. For example, approximately 0.5 percent of the total statewide employment (all groups combined) was in Group 6 in the Bay Area, so approximately 0.5 percent of the 200 samples (one sample) were selected from that strata. Cascadia also randomly selected 30 multi-family sites with commercial sourceseparated recycling or compost service from among the 50 recruited multi-family sites. Because the availability of multi-family sites with recycling service was variable between regions, the project team did not set allocations by region.

The 430 generator sites selected to participate in Task 4 included most of the Task 3 sites, but given that the Task 4 requirements were different than the Task 3 requirements, there wasn't a perfect overlap between the two tasks. Table 86 details, by industry group and region, the number of businesses planned to be selected for inclusion in the Task 3 analysis.

Table 86. Distribution and Number of Sites Included in the Task 3 Special Analysis

|  | Industry Group | Regions |  |  |  |  |  |

|  | Total | 44 | 8 | 2 | 114 | 32 | 200 |

## Comparison of Task Methodologies

The methodologies for each of the three generator tasks were similar, but not the same; this section summarizes the similarities and differences in methodologies between the three tasks.

## Methodological Overlap

All three tasks had the following approaches in common:

- Recruitment efforts-The same recruitment process was used for all three tasks. The generator sites selected for inclusion in Tasks 3 and 4 were a subset of the generator sites recruited for Task 2.
- Industry groups-The same industry group definitions were used in each task.
- Sample collection process-A consistent method was used to collect samples for all tasks.
- Sample sorting procedure-The same sorting procedure was used for sorting all collected samples, though the Task 2 samples were transported to a local disposal facility for sorting and Task 4 samples were sorted at the generator sites.
- Material list-The same list of 82 materials, as defined by CalRecycle, was used to characterize all samples. The complete material list can be found in Appendix B: Material Definitions.

## Methodological Differences

The same basic methodology was used in all three tasks; the differences between tasks were isolated to the material streams characterized and the methods used to allocate samples among the regions and industry groups. The main differences between the tasks were:

- Task 2 characterized and quantified disposal at all 850 recruited generator sites.
- Task 4 sites were a subset of the 850 total generator sites. All diversion streams (including informal recycling markets and take-back programs) were characterized and quantified, in addition to the disposal stream at the 430 sites selected to participate in this task.
- Task 3 sites were a subset of the Task 4 sites. For the Task 3 sites, only the commercially collected diversion that was placed in collection containers provided by haulers or recyclers was included in the analysis. The field crew performed a more detailed sort of the Disposed, Curbside Recycle, and Curbside Organics stream samples obtained from Task 3 generators. This detailed subsort consisted of further sorting certain material types according to the degree and source of contamination of the materials. The purpose of
the contamination subsort was to estimate the fraction of the sorted materials that a MRF or organics processor could recover, recognizing that not all "recoverable" material arriving at a facility was in a condition that permits its recovery due to contamination.

## Recruitment

Once waste samples for Task 2 were collected from generators, they were taken to a solid waste facility for sorting and disposal. Therefore, sampling areas consisted of areas within a 30 -mile radius of randomly selected solid waste facilities (nodes). This section details the sorting facility and generator recruitment processes. In addition, this section details the information that Cascadia's recruiters collected from the nodes and the generators.

Node and generator recruitment were interconnected: Nodes were recruited first, and then generators were recruited within 30 miles of each selected node.

## Node Recruitment

CaIRecycle staff used CaIRecycle's Solid Waste Information System (SWIS) database to identify potential nodes. The pool of potential nodes included only permitted facilities that accept putrescible solid waste (i.e. food waste) for disposal or transfer/processing. The initial list was screened to remove sites that were too small, only processed construction and demolition materials, had limited operations, etc. Except for the Mountain region, the project team recruited one node per region for each of the seasons. Due to the low population and smaller number of businesses in the Mountain region, we only recruited two nodes for that region and only visited the region during two seasons.

CalRecycle staff then mapped the population density around each potential node and eliminated those in areas below a defined population density. The density cutoff was different in each region and reflected the population characteristics of each region. Staff then categorized the remaining potential nodes for each region as being in either high or low population density areas. To select four nodes for each region, staff randomized each list of potential nodes, started recruitment calls at the top of the list, and continued until we recruited three facilities in high-density areas and one facility in a low-density area.

The recruitment process included contacting the randomly ordered potential nodes, verifying their suitability as a sorting location, and confirming their willingness to participate. For each selected facility, we obtained contact information for individuals associated with the facility who (1) could authorize permission for data collection events, and (2) were responsible for managing the facility on a day-to-day basis.

The recruiters used a script for node recruitment. This script included a brief introduction to the study and to the needs of the field crew, and it asked for basic information about the best on-site point of contact, the facility's operations, and the facility's ability to
accommodate a space for sample storage and sorting. The recruitment script can be found in Appendix D: Field Forms.

The 18 facilities listed in Table 87 were recruited as nodes. Through the course of the study, some sites dropped out and other nearby sites were used as sorting sites, although the sampling areas around the original nodes remained the same.

Table 87. Selected Nodes

| Region SWIS Number | Facility Name | Size | County | Season |
| :---: | :--- | :--- | :--- | :--- |
| Coastal |  |  |  |  |
| 12-AA-0033 | Hawthorne Street Transfer Station | Small | Humboldt | February |

| 37-AA-0020 | West Miramar Sanitary Landfill | Large | Los Angeles | October |
| 19-AA-0056 | Calabasas Sanitary Landfill |  |  |  |
| Valley |  | Large | San Joaquin | February |
| 39-AA-0045 | Recology Stockton | Large | Kings | April |
| 16-AA-0015 | KWRA Material Recovery Facility | Large | Fresno | July |
| 10-AA-0145 | Rice Road Recyclery \& Transfer Station | Small | Shasta | October |

Cascadia assigned nodes to sampling seasons in the order that nodes were recruited. For instance, the first node recruited in each region was assigned to the first season (February), the second node was assigned to the second season (April), and so on. If needed, schedules were adjusted if requested by the selected facilities. We planned to visit the Mountain Region in April and July to avoid winter weather events that could block access to remote mountain locations. The nodes are mapped in Figure 71 along with their SWIS number and the 30 mile sample area around each node from which generators sites were recruited.

Figure 71. Map of Nodes with their SWIS Number

## Generator Site Recruitment

The generator recruitment process involved two key steps. First, the project team made initial phone calls to potential businesses to solicit their participation in the study. Second, the recruiters conducted follow-up calls to businesses that were willing and deemed eligible to participate in the study. These follow-up calls collected information regarding collection service, waste disposal and recycling practices, and logistics to aid in scheduling site visits. These two steps are presented in detail in the Recruitment Process section below. Cascadia continued recruitment until 800 businesses and 50 multi-family generators agreed to participate in the study. We collected garbage samples from all 800 businesses and 50 multi-family sites. An additional 80 contingency businesses (for a total of 880 businesses) were recruited to provide alternate sites in case a business declined to participate once the field crew arrived or logistical issues arose around the site visit.

## Recruitment Scripts

Cascadia provided a script for recruitment staff to use during generator recruitment. The script included: methods for staff to introduce the study concepts; methods to recruit generators to participate in the study; screening criteria that determined if generators were eligible for the study; and prompts for recruiters to collect the required contact information for the follow-up calls. Cascadia also provided a script for recruitment staff to use during follow-up calls to the recruited generators to collect information regarding collection service, waste disposal and recycling practices, and logistics to aid in scheduling site visits. Refer to Appendix D: Field Forms for an example of the Initial Business Recruitment Script.

## List of Eligible Business Sites

The project team acquired a list of businesses (with contact information) to include in the recruitment from a private business data clearinghouse. The steps in this process were:

- Map a 30 mile-radius circle around each selected node using GIS software. If the circle included areas from other regions, those areas were eliminated from the sampling area. For example, the orange region shown in Figure 72 would have been removed from the sampling area for this node (Potrero Hills Landfill) because the counties in the orange area were included in the Central Valley region and the node was part of the Bay Area region.

Figure 72. Node with 30-Mile Circle

- Determine which ZIP codes were wholly or substantially within the node circle (GIS software was used to determine the percent of each ZIP code within the circle). ZIP codes outside of the region were excluded. For ZIP codes partially within the circle, if the ZIP code's major population center was within the node circle, the ZIP code was included. If the ZIP code's major population center was outside the node circle, the ZIP code was excluded. Figure 73 shows an example map with the ZIP code and population density information used to finalize ZIP code lists for each node.

Figure 73. Example Node with ZIP Codes

- Purchase a list of all businesses with more than five employees within the included ZIP codes. Businesses with fewer than five employees were excluded because they do not generate enough material weekly to meet the minimum sample weights.
- Randomize the list order, assign each business a unique ID number, and organize the list of businesses by industry group and node. Then, we imported the organized generator information into the recruitment database.

The ZIP codes for each node are listed in Table 88 through Table 92.

Table 88. ZIP Codes in Bay Area Node, by Season

| Bay Area |  |  |  |  |  |  |  |  |  |  |

## List of Eligible Multi-Family Sites

The multi-family sites were recruited and samples were collected and sorted using the same methods as for businesses; however, the nodes used for the multi-family recruitment differed from the business nodes. Multi-family waste characterization for this study overlapped with CalRecycle's disposal facility-based study, which used a different set of facilities for waste sampling. Those disposal facilities were used as nodes for multi-family sampling. The steps to acquire a list of multi-family sites were to:

Map a circle with a 30-mile radius around each selected multi-family node.
Determine which cities were wholly or substantially within the node circle.
Develop a list of all multi-family sites within the included cities using an online Yellow Pages search.

Randomize the list order and assign each multi-family site a unique ID number. Then, import the organized generator information into the recruitment database.

## Recruitment Process

The two-step process for recruiting commercial and multi-family generators is detailed below.

## Step 1. Initial Recruitment

Project staff telephoned generators in the recruitment database to determine their eligibility and willingness to participate in the study. The recruiter attempted to speak with a manager or supervisor who could give permission for the site to participate in the study. The recruiter introduced the study concepts and described the study as consisting of two parts: (1) a telephone interview and (2) up to two site visits to measure disposal and diversion, obtain samples of the site's waste and recycling, and gather further site and additional diversion information. If the contact refused either of these parts, the recruiter removed the site from eligibility for the study. Cascadia staff assured each recruited business that findings would be recorded anonymously and that business identities would not be divulged to any parties outside of the core project team.

After a site agreed to participate in the study, the recruiter further determined eligibility by asking additional questions to ensure that the generator belonged to the targeted industry group, that there were no logistical barriers to sampling and data collection, and that the generator's waste stream was collected separately from that of other neighboring generators. If a business did not meet these broad criteria, or if it could not provide the information that would determine if it met these criteria, we did not include it in the study.

If the recruiter needed to discard a potential site for any reason, the next business on the list for that industry group was contacted. A recruiter could follow up with a business up to three times before rejecting that business from the study. Recruitment for each industry group continued until recruitment goals were met. An example recruitment call sheet is included in Appendix D: Field Forms.

## Step 2. Follow-up Data Collection

After each generator had been confirmed as eligible and willing to participate, we conducted follow-up calls to collect additional information that was used to (1) determine how to arrange and conduct visits for data collection purposes, (2) quantify and characterize disposal and diversion, and (3) correlate disposal and diversion information with other information about the generator (such as number of employees, participation in recycling programs, number of visitors, etc.). The following information was collected.

## General Information

- Name and physical address of the company/organization
- Names and contact information for the person(s) who could grant permission for participation in the study, the person(s) who could supply data related to waste disposal practices and quantities, and the person(s) who could assist directly with on-site measurement and sampling visits
- A general description of the nature of the business if it was not easily determined by the business name (e.g., if it was in the electronics industry, was it a manufacturer or a wholesaler?)

## Analytical Information

- Hours and days during which waste and recycling were generated (sometimes different than business hours)
- Number of distinct material streams at the location
- Numbers, locations, and approximate sizes of containers for waste
- Days and times of scheduled waste and recycling service
- Times or ranges of time when waste was taken to dumpsters
- Name and contact information for all hauling companies that serve the location
- Characterization and quantification of disposal and diversion activities, to the extent that this could be determined over the phone
- Number of employees expressed as Full Time Equivalents (FTE) and total employees
- Tonnage information for businesses with compactors or roll-off containers for disposed waste
- Awareness regarding California's Mandatory Commercial Recycling (MCR) law

## Logistical Information

- Hours during which it was possible for our team to schedule data collection visits
- Layout of the site (including a map if the location was large enough to merit it)
- Specific places to visit on-site in order to observe, quantify, and characterize waste
- Specific procedures for accessing the waste, gaining assistance, taking measurements, taking samples, etc.

Recruiters used the following approaches to facilitate the efficient collection of accurate diversion information.

- Using a list of typical material diversion activities to prompt discussions with personnel at generator sites. The recruitment form included a list of recycling and/or composting activities typical for business and multi-family sites as prompts to gather information about diversion at each site.
- Contacting headquarters of chain stores when local branches do not maintain recycling and diversion records. If an individual chain store had an existing recycling program but did not maintain information about its program at the individual store location, we contacted the chain headquarters and requested the information for the individual store.
- During follow-up calls, Cascadia staff again assured each business that all study data would be recorded anonymously and that business identities would not be divulged to any parties outside of the core project team. An example Business Recruitment Form is included in Appendix D: Field Forms.

Cascadia's in-office staff recorded all recruitment data in the recruitment database. Appendix D: Field Forms includes screenshots of the recruitment database.

## Task 3 and Task 4 Participation

The project team randomly selected 400 businesses and 30 multi-family sites with diversion activities for Task 4 from within the list of 800 businesses and 50 multi-family sites recruited for the study. These were not additional generators; they were a subset of the generators recruited to participate in the study. To select businesses for participation in Task 4, Cascadia organized recruited businesses into lists by industry group and region. Then, the project team randomized the lists and selected generators from each of these lists, starting at the top of each list and moving down until the sampling allocation within industry groups and regions were achieved. To select multifamily generators to meet Task 4 regional sampling allocations, Cascadia randomly selected six Task 2 multi-family sites from within each region.

One of the study objectives was to quantify total generation in each industry group by combining the Task 4 diversion data with the disposal data collection in Task 2. To avoid overestimating the diversion quantities for a group, generators with zero diversion (when randomly selected) were included in Task 4. We essentially treated these sites as generators with empty diversion containers. This means a generator site selected for Task 4 may not have had any diversion. If a business with zero diversion was randomly selected to participate in Task 4, it was included in the analysis but did not count toward the Task 4 recruitment target. Task 4 selection continued until 400 businesses with
diversion had been selected. This means the diversion composition and quantity calculations for some groups are based on more than 25 sites.

Task 3 was simply a separate analysis of only the commercially collected (i.e., by a commercial hauler or recycler) diversion samples from sites selected to participate in Task 4. To select sites for the Task 3 analysis, Cascadia filtered the list of Task 4 sites to include only generators with commercial source-separated recycling and/or organics collection service. Samples were distributed to reflect the overall statewide commercial sector based on employment by industry group and region. If the Task 3 allocations could not be met using the list of filtered Task 4 sites, we randomly selected additional generators from the list of Task 2 recruited sites and characterized their commercially collected diversion until we reached the required allocation of 230 sites.

## Generator Site Recruitment Quality Assurance/Quality Control

The purpose of QA/QC measures during business recruitment was to ensure that recruiters collect and communicate accurate information during recruitment so that data collection activities could proceed according to plan. After a business was initially recruited to participate in the study, Cascadia staff conducted follow-up calls to confirm the generator information that recruiters collected. We noted all of the required information on a separate form for later entry into the recruitment database. In our communications with businesses, Cascadia ensured that we were speaking to the individuals who were authorized to grant permission for data and sample collection and, if necessary, any other individuals associated with the site who were empowered and able to provide accurate information about the site's operations, waste service levels, and other relevant disposal information.

## Field Sampling/Sorting

This section provides a detailed description of the fieldwork processes for the three tasks, including: scheduling site visits, collecting samples, and sorting samples.

## General Design Elements

For disposal sampling, a four-member crew-one crew manager and up to three field crew members-collected and sorted samples. For diversion sampling, two crewseach consisting of a crew manager and a field crew member-collected and sorted samples. Each sampling crew was responsible for:

- Coordinating with the generator sites and nodes.
- Collecting waste, recycling, or organics samples as appropriate for the task.
- Collecting information to determine disposal rate or diversion rate data.
- Confirming the information collected during business recruitment.

The crew manager for each team tracked actual samples collected and sorted against targets. The crew manager also consistently checked the data sheets for errors or missing data that could be corrected in the field.

## Sampling Schedule

Sampling was planned to take place over approximately six weeks in each of four seasons. Season 1 was planned to begin in early February, Season 2 in April, Season 3 in July, and Season 4 in early October.

## Field Crew Training and Supervision

Prior to the commencement of sorting activities for each task, our entire field crew underwent training to learn the material types and sorting protocols for this study. This training also covered Cascadia's Health and Safety Plan, which is updated whenever new safety information, products, or regulations that apply to a project become available. The crew managers were responsible for implementing and maintaining safe working practices in their work areas and for answering worker questions about the Health and Safety Plan. For detailed health and safety measures, refer to Appendix H: Health and Safety Plan.

## Scheduling Site Visits

During the recruitment process, the recruiter documented all steps necessary for the field crews to visit the generator sites, access containers, and obtain a representative sample from each targeted stream. These steps specified where the crews should obtain each sample, how the crew could overcome any barriers to sampling (such as locked gates, closed facilities, locked dumpsters, and enclosed compactors), permissible time windows when the crews could obtain a representative sample from the site, and contact information for a person on-site who could assist with the sample collection process.

Recruiters considered several factors when suggesting an optimal time for a sampling visit: waste collection schedules, when the business takes the waste to the container(s), the hours of waste generation at the business, and the times when the container was accessible. We attempted to schedule site visits after an adequate time had passed since the last waste collection, but not so close to the next collection as to risk arriving just after a pick-up. The field crews scheduled a specific day and time for each visit if requested by the site. Otherwise, the field crew collected samples and completed site visits on a schedule that maximized both their efficiency and the quantity of waste at the site.

The following examples illustrate the considerations that went into timing an audit visit that involved measuring the amount of material in dumpsters. Separate considerations were given to each stream at each generator site.

## Scenario 1:

Trash taken to dumpster: Continuously, 6 a.m. to 5 p.m.
Trash pick-up schedule: Monday, Wednesday, Friday at 6
a.m.

Hours the dumpster was 8 a.m. to 5 p.m. accessible:
In this scenario, the recruiter would have concluded that the appropriate window for measurement was Tuesday or Thursday late afternoon, between 3pm and 5pm.

## Scenario 2:

Trash taken to dumpster: Every night at 10 p.m.
Trash pick-up schedule: Monday, Wednesday, Friday at 6 a.m.

Hours the dumpster was 8 a.m. to 5 p.m. accessible:
In this scenario, the recruiter would have attempted to have the business take their trash out earlier on the day in question, and assigned the observed amount of trash to the number of hours that the business had been in operation since the last collection.

## Scenario 3:

Trash taken to dumpster: 5 p.m. every day
Trash pick-up schedule: Every Wednesday morning
Hours the dumpster was 8 a.m. to 5 p.m.
accessible:
In this scenario, it would have been acceptable to record the amount of waste in the dumpster on Sunday, Monday, or Tuesday while noting whether the measurement included waste taken to the dumpster on the measurement day or not.

## Scenario 4:

Trash taken to dumpster: Continuously, 6 a.m. to 11 p.m.
Trash pick-up schedule: Every day at 10 a.m. and 4 p.m.
Hours the dumpster was 8 a.m. to 11 p.m.
accessible:
In this scenario, it would have been necessary to take the waste disposal measurements shortly before one of the two pick-ups on any given day.

## Sample Collection

The field crew manager visited each selected site to quantify disposal and diversion. For Task 2, the manager also collected one or more samples of disposed waste for transportation to the local node, where the field crew sorted the sample. Diversion samples were sorted at the generator site and returned to the diversion containers after sorting. The field crew collected disposal and diversion samples using the following procedure.

At participating sites with multiple containers from the same stream, staff randomly selected a single container for sampling to represent the site's stream. In cases where there were two or more distinct streams at a site, field crew randomly selected one waste container to sample for each stream.

The field crew randomly chose as a sample a vertical cross section, or "slice," of material from the selected container. Each sample consisted of all material in the slice, from the top to the bottom of the container. An illustration of the slices is shown in Figure 74. For garbage samples, the field crew ensured that each sample weighed at least 200 pounds. In cases where all of the material in the dumpster was less than 200 pounds, field crew drew waste from other containers in the same waste stream until they met the 200-pound sample requirement. In cases in which a business had less than 200 pounds available at the time of the visit, the sample crew collected all material available and returned later in the field season to collect the quantity of material needed to reach the 200-pound target. For diversion samples, the field crew collected all material in all containers for each stream, up to 125 pounds per stream. In cases in which all of the material for a stream was less than 125 pounds and the visit approximately coincided with the optimal sampling period, the sample was considered complete. In cases where all of the material for a stream was less than 125 pounds and the visit did not approximately coincide with the optimal sampling period, the field crew made one additional visit later in the field season to collect additional material.

Figure 74. Example Dumpster with Slices Illustrated

In cases where the material was inaccessible, unique arrangements were required for the sample collection to proceed. For example, if the site used a compactor, the team provided rolling carts for the businesses to deposit material into for one or more days rather than the compactor. The field crew then took material that accumulated in the rolling containers as the sample.

For garbage samples, the field crew contained the collected sample to prevent crosscontamination with other samples, labeled the sample with relevant details about its source using a sample placard, and transported the sample to the local node.

## Collect Disposal Quantity Information

While on-site at each business, the field crew recorded the volume of waste in each container. We used this information to calculate annual disposed waste tonnage for each business and extrapolate these results to each industry group. The procedure for measuring waste during the site visit is described below. The field crew recorded this information on paper forms for later entry into the centralized generator database.

Disposed Waste Volume Measurements: The field crew recorded the length, width, and height to the nearest inch for all disposed waste at each site. The volume of the disposed waste at each site was the sum of all volumes for each waste container (if there was more than one container on-site), in cubic inches.
Disposed Waste Accumulation Time: During initial recruitment screening calls, recruiters asked the responsible party at the site for information to determine waste accumulation time, including the business operating hours, the time the waste containers were last collected by the hauler (or regular collection schedule), and when trash was regularly taken outside to dumpsters. While on-site, the field crew verified this critical information.

## Collect Diversion Quantity Information

While on-site, the field crew collected information about the amount of materials collected in recycling and composting containers. We used this as well as other information to calculate annual recycling and diversion quantities for each business. The procedure for measuring materials during the site visit is described below. The field crew recorded this information on paper forms for later entry into the centralized recruitment database.

Diverted Material Volume Measurements: The field crew recorded the length, width, and height to the nearest inch for all recyclable and compostable materials disposed in containers at each site. The volume of the diverted material at each site was the sum of all volumes for each container (if there was more than one container on-site), in cubic inches.

Diverted Material Accumulation Time: During initial recruitment screening calls, recruiters asked the responsible party at the site for information to determine diverted material accumulation time, including the business operating hours, the time the containers were last collected by the hauler (or regular collection schedule), and
when material was regularly taken to outside containers. While on-site, the field crew verified this critical information.

## Confirm Additional Diversion Practices

The field crew confirmed data for the additional diversion practices (such as backhauling, self-hauling, source reduction, and reuse) during the same visit where they sampled, sorted, and quantified the diversion streams collected in commercially hauled containers.

The recruitment staff collected information about the site's existing recycling, composting, and other diversion practices that the field crew reviewed before they arrived at the site for the diversion assessment. At each site, the field crew manager met with key personnel to discuss existing recycling, composting, or other diversion practices, and to document missing data not collected by the recruiters. The intent of these meetings was to verify quantity data and other information about diversion activities that the sampling and sorting of materials collected on-site did not capture.

## Sorting Procedures

The sorting process for garbage and diversion samples was the same except that samples from each task were sorted in different locations. Business garbage samples were transported for sorting and disposal to the local node. Multi-family garbage samples were sorted following the same protocol, but were collected and sorted as part of the accompanying disposal facility-based study, rather than this study. For diversion samples, the field crew sorted the samples on-site at each business or multi-family site.

After selecting and measuring the volume of each sample, the field crew sorted each sample using the following procedure.

Photograph the sample. The field crew placed the sample on a tarp. Using a digital camera, the crew manager took a photograph of the sample. A sample placard that identifies each sample was positioned so it was visible in each photograph.

Sort the sample. The field crew sorted samples by material types into plastic laundry baskets. The field crew members typically specialize in groups of materials, such as papers or plastics, and focus on sorting those materials from the rest of the sample. The field crew manager monitored the homogeneity of the component baskets as they accumulated, rejecting materials that were improperly classified. Open laundry baskets allowed the manager to see the material at all times. The material list that the field crew used to guide this sorting is presented in Appendix B: Material Definitions.

In general, material that was clean and dry or that was lightly contaminated was sorted into its material category. For example, damp cardboard was sorted as uncoated corrugated cardboard and a can of refried beans with a little left was sorted as tin/steel cans - other. Material that was substantially contaminated with other materials was sorted into the appropriate remainder/composite category.

For the Other Miscellaneous Paper and Remainder/Composite Paper types, the compostable portions were sorted separately. For example, items made entirely of paper that were sorted into remainder/composite paper that were substantially contaminated with moisture or food were put into remainder/composite paper compostable, such as cardboard trays used for cakes that have a lot of food left on them. Paper items substantially contaminated with other things not desirable for composting (such as motor oil or paint) went into remainder/composite paper other.

Weigh and record data. After each sample had been completely sorted, the field crew manager weighed the material in each category. The manager verified the purity of each component as it was weighed, before recording the weight. After verifying purity, the manager recorded the weights on paper field forms. The sample weight equaled the sum of the weights of all the sorted components.

For all sites included in the Task 3 analysis, both the disposed material stream samples and the commercially collected diverted material stream samples were sorted to a more detailed list. While the field crew sorted the samples from these generators into the materials listed in Appendix B: Material Definitions, they further sorted 20 of the material types into three subtypes: clean, bin-contaminated, or source-contaminated. The 20 materials included in the more detailed sort are listed in Table 93. This list corresponds to that used in the contamination subsort in CalRecycle's California 2008 Statewide Waste Characterization Study.

Table 93. Materials Included in the Contamination Subsort

| Paper | Metal |
| :--- | :--- |
| Uncoated Corrugated Cardboard | Tin/Steel Cans - CRV Bimetal Containers |
| Paper Bags | Tin/Steel Cans - Other |
| Newspaper | Aluminum Cans - CRV |
| White Ledger | Aluminum Cans - Non-CRV |
| Other Office Paper | Plastic |
| Other Miscellaneous Paper - Compostable | PETE Containers - CRV |
| Other Miscellaneous Paper - Other | PETE Containers - Non-CRV |
| Remainder/Composite Paper - Rigid Food and Beverage Cartons | HDPE Containers - CRV |
| Remainder/Composite Paper - Compostable | HDPE Containers - Non-CRV |
| Remainder/Composite Paper - Other | Miscellaneous Plastic Containers (\#3-\&7) - CRV |
|  | Miscellaneous Plastic Containers (\#3-\&7) - Non-CRV |

The definition for each contamination category is included at Appendix B: Material Definitions. The contamination subsort was intended to provide CalRecycle with the information necessary to evaluate actual and potential diversion that occurs through binbased source separation activities.

The sorting crew thoroughly cleaned the sorting area at the end of each sampling and sorting event.

## Contingency Measures

We included general contingency plans to address unforeseen circumstances that we anticipated could arise over the course of this study. Though our study design included
comprehensive measures to avoid delays or mishaps, we acknowledged the inevitability of such occurrences and planned contingency measures accordingly. These measures included the following:

Over-recruitment of business and multi-family sites. Initially we over-recruited businesses by 10 percent to accommodate for any recruited businesses that might drop out of the study after agreeing to participate. We also recruited one extra multifamily site for each geographical region, in the event that something prevented the capture of valid waste samples at the intended multi-family location.
Ideally, complete and high-quality data for both composition and waste quantity would be obtained for each site visited. This is not always the case. During the course of the study, data from each site was tracked and assessed for completeness and quality. In some cases, the composition data for a site could be good but the quantity data was incomplete (i.e., a representative sample meeting minimum weight requirements was collected and sorted, but the overall quantity of materials could not be estimated with confidence). In this case, the site counted toward the recruitment goal, the composition data was included in the composition calculations, and the quantity data was not used. If the quantity data was good but the composition data was incomplete (i.e., the quantity of materials in the desired stream could be estimated with confidence but a representative composition sample could not be obtained and sorted), the site did not count toward the goal, the quantity data was included in the quantity calculations, the composition data was not used, and an additional site was recruited to make up for the missing composition data. This process was repeated until the recruitment goals were met.
Plan for repeat visits to meet sample weight goals. If the field crew arrived to collect a sample and there was not enough material on-site to meet the minimum garbage sample weight of 200 pounds, we collected the garbage material available that day and planned to make an additional visit to complete the sample. Originally the field crew made repeat visits to the site in question until they achieved the minimum sample weight. As fieldwork progressed, a limit of two site visits in areas with fewer sampling sites, and three visits in larger areas, was adopted to maintain field efficiencies. Sampling crews were in smaller areas for shorter periods and therefore had smaller windows of time to accomplish sampling.

## Data Forms

Cascadia developed data collection forms specifically for this study. Examples of each of these forms are provided in Appendix D: Field Forms.

Site Visit (Bin Data) Forms were created to collect the site visit data for each generator site.

Sample Placards were created to identify samples after transportation from the generator site (for garbage samples) and to identify samples in pictures. The sample placards were brightly colored paper signs with the sample number pre-printed on the front.

Material Weight Tally Sheets were created to record the material weights for each sample.

Sample Tracking Forms were created to track the progress the field crews were making toward the sampling goals.

The data forms and database were developed prior to the start of sampling to ensure accuracy, consistency among forms, and efficient recording of data.

## Approach to Coordination

Due to the complex nature of each task in this study, we communicated with generators, haulers, and sort facilities to ensure we had all the information needed to complete the study effectively as well as keep all parties apprised of the collection and sampling activities. The approaches to coordination for each task are detailed below.

## Pre-Field Sampling Planning and Coordination

Prior to fieldwork, we prepared this study design that covers all three tasks. The design incorporates the fieldwork schedule as well as targeted numbers of samples, a plan for collecting and sorting samples, a description of how fieldwork was coordinated with all affected parties, methods and protocols for characterizing samples, health and safety measures, and general contingency measures.

## Coordination with Selected Sorting Sites, Haulers, and Generators

Cascadia contacted each selected sorting facility the week before and the day prior to each sorting event, and asked facility representatives to notify their staff of each sorting event. Upon arrival and prior to departing the node, the sorting crew checked in with the designated facility contact. The crew remained in communication with facility staff, such as loader drivers working in or near the sorting area, throughout their time at each site.

Once all generators had been recruited for a sampling season, a list of haulers and recyclers that serve these generators was provided to CalRecycle staff who then sent an informational letter to each hauler. An example letter can be found in Appendix D: Field Forms. Cascadia called affected haulers the week before the sampling began to remind the haulers of the upcoming sampling activities.

Cascadia called each scheduled business the week before sampling in their region began to remind the business that they had agreed to participate and to schedule a specific day and time for each visit if requested by the site.

## Data Management Plan

This section describes the processes Cascadia used to manage and analyze the data collected in this study. The Cascadia team performed all data entry and analysis in a manner that was consistent with and comparable to past research efforts using data management tools that were compatible with CalRecycle's approved protocols.

## Quality Assessment/Quality Control

Throughout every step of every task, the Cascadia team implemented sound quality control practices to ensure consistency, comparability, and accuracy of data. Our quality control measures were comprehensive and designed to provide multiple checks of the data collection and data entry processes.

Our highly experienced QA/QC manager directed and oversaw data entry and analysis across all research efforts and provided overall quality control for all work products and deliverables. Errors or discrepancies in data discovered during quality control were investigated, resolved (including additional sampling if necessary), and communicated to field team members to inform field supervision and data collection processes.

## Sorting and Quantification Data

For data collected during the sorting of each sample, the field crew manager reviewed the field forms every day and rectified any errors while the day's work was fresh in their mind. After reviewing the forms in the field, the field crew manager made copies of the forms and shipped the copies to Cascadia's home office for entry into a database. Inoffice staff performed random spot checks of the data entered into the database to ensure the accuracy of the data entry process.

For all other on-site data collection, including the quantification of disposal and diversion, the field crew reviewed their notes immediately upon completion of data collection and, if necessary, contacted the generator to ask any questions or clarify inconsistent information. Furthermore, if the generator did not have information available on-site, such as recycling invoices or receipts, the recruiter followed up with a phone call in one week to obtain the data. The field crew manager made copies of the forms produced, and the copies were shipped to Cascadia's office for entry into a database.

## Data Entry

Cascadia designed a customized data entry and analysis database for all field data. The database was designed with built-in safeguards to reduce the chance of errors. For example, each entry field only accepted data values that lie within appropriate ranges. The entry fields also required staff to enter all data twice, and automatically compared the entries, flagging any entries that do not match.

After each week of work, the field crew delivered all field forms to Cascadia's office for high-level review (to ensure that all fields were filled in, all field forms were accounted for, the necessary data was collected in each field, etc.). Any anomalies discovered during this step were reviewed and clarified with the field crew manager and/or the site. After review, the project team entered the data into the customized database. Cascadia's QA/QC manager inspected the entered data and resolved any anomalous data points (outliers) against the hand-written field forms and sample photos.

## Analysis

The methods and calculations for calculating means and descriptive statistics generally replicated those used in the previous CalRecycle generator studies from 1999 and 2006. Refer to Appendix C: Description of Calculations for detailed methods and calculations.

The Task 3 analysis included only the commercially collected diversion at the subset of sites selected for participation in the analysis. The Task 3 analysis excluded sites reporting substantial scavenging.

## Appendix B: Material Definitions

## Mapping the Material Types to the Compact List Used for Reporting

The field crew sorted samples into 82 unique material types. The detailed composition tables presented in the main body of the report aggregate those 82 materials into a compact list of 68 material types designed to focus on the divertible materials. Table 94 illustrates how the complete list of 82 materials was aggregated into the list of 68 materials. Composition tables containing data for all 82 types are found in Appendix E : Detailed Composition Tables.

Materials noted with an asterisk were included in a special contamination subsort. See Table 92 and Appendix A: Detailed Methodology for further information.

Table 94: Comparison between the 2014 Standard List and 2014 Expanded List

| Material Type | 2014 Compact Material List | 2014 Expanded Material List |
| :---: | :---: | :---: |

## Material Definitions

Materials noted with an asterisk were included in the contamination subsorts.

## Paper

1. Uncoated Corrugated Cardboard* means a paper laminate usually composed of three layers. The center wavy layer is sandwiched between the two outer layers. It does not have any wax coating on the inside or outside. Examples include entire cardboard containers, such as shipping and moving boxes, computer packaging cartons, and sheets and pieces of boxes and cartons. This type does not include chipboard boxes such as cereal and tissue boxes. This type does include very clean (no food residue and only lightly stained) pizza boxes.
2. Paper Bags* means bags and sheets made from kraft paper. The paper may be brown (unbleached) or white (bleached). Examples include paper grocery bags, clean fast food bags, department store bags, and heavyweight sheets of kraft packing paper.
3. Newspaper* means paper used in newspapers. Examples include newspaper and glossy inserts found in newspapers, and all items made from newsprint, such as free advertising guides, election guides, plain news packing paper, stapled college class schedules, and tax instruction booklets.
4. White Ledger Paper* means bleached, uncolored bond, rag, or stationery grade paper, without ground wood fibers. It may have colored ink on it. When the paper is torn, the fibers are white. Examples include white paper used in photocopiers and laser printers, and letter paper.
5. Other Office Paper* means paper used in offices other than white ledger paper. Examples include colored ledger, computer paper, manila folders, manila envelopes, index cards, white envelopes, white window envelopes, white or colored notebook paper, ground wood computer paper, junk mail, and carbonless forms.
6. Magazines and Catalogs means items made of glossy coated paper. This paper is usually slick, smooth to the touch, and reflects light. Examples include glossy magazines, catalogs, brochures, pamphlets, and glossy advertisements.
7. Phone Books and Directories means thin paper between coated covers. These items are bound along the spine with glue. Examples include whole or damaged telephone books, yellow pages, real estate listings, and some nonglossy mail order catalogs.
8. Other Miscellaneous Paper - Compostable* means items made mostly of paper that could be composted, that do not fit into any of the other paper types. Paper may be combined with minor amounts of other materials such as wax or glues. Examples include pulp paper egg cartons, unused pulp paper plant pots, molded paper packing materials, some berry trays, some take-out food containers, and dirty molded paper plates.
9. Other Miscellaneous Paper - Other* means items made mostly of paper that do not fit into any of the other paper types, but that are generally recyclable or not generally composted. Paper may be combined with minor amounts of other materials such as wax or glues. This type includes items made of chipboard, ground wood paper, and deep-toned or fluorescent dyed paper. Examples include cereal and cracker boxes, paperboard boxes for software, unused paper plates and cups, goldenrod colored paper, school construction paper, butcher paper, ice cream cartons and other frozen food boxes, self-adhesive notes, and hard cover and paperback books.
10. Remainder/Composite Paper - Rigid Food and Beverage Cartons* means aseptic containers (multi-layered packaging that contains shelf-stable food products such as apple juice, soup, soy/rice milk, etc.) and "gable top" cartons (non-refrigerated items such as granola and crackers; refrigerated items such as milk, juice, egg substitutes, etc.). Rigid food and beverage cartons are usually paper-based, may be any shape, and may include a plastic pour spout as part of the carton.
11. Remainder/Composite Paper - Compostable* means items made mostly of paper, that don't fit into any other material types, that are combined or contaminated with large amounts of other materials such as wax, food, and
moisture, that are compostable. Examples include waxed corrugated cardboard, waxed paper, napkins, tissue, paper towels, fast food wrappers, food-soiled paper and moisture-soiled paper, all pizza boxes (unless at least 95 percent clean), and shredded paper.
12. Remainder/Composite Paper - Other* means items made mostly of paper but combined with large amounts of other materials. These are items that do not fit into any other categories, are not generally compostable or recyclable, and are not food and beverage cartons. Examples include blueprints, sepia, onion skin, carbon paper, photographs, paper frozen juice cans, sheets of paper stick-on labels, and paper mailing envelopes lined with bubble wrap or plastic.

## Glass

13. Clear Glass Bottles and Containers - CRV means clear glass containers that display the CRV notification. Examples include whole or broken clear soda bottles and fruit juice bottles, and whole or broken clear wine cooler bottles.
14. Clear Glass Bottles and Containers - Non-CRV means clear glass containers that do not display the CRV notification. Examples include clear wine bottles, mayonnaise jars, and jam jars.
15. Green Glass Bottles and Containers - CRV means green-colored glass containers that display the CRV notification. Examples include whole or broken green soda and beer bottles.
16. Green Glass Bottles and Containers - Non-CRV means green-colored glass containers that do not display the CRV notification. Examples include green wine bottles.
17. Brown Glass Bottles and Containers - CRV means brown-colored glass containers that display the CRV notification. Examples include whole or broken brown beer bottles.
18. Brown Glass Bottles and Containers - Non-CRV means brown-colored glass containers that do not display the CRV notification. Examples include whole or broken brown wine bottles.
19. Other Colored Glass Bottles and Containers - CRV means other-colored glass containers that display the CRV notification. Examples include whole or broken blue soda and water bottles.
20. Other Colored Glass Bottles and Containers - Non-CRV means othercolored glass containers that do not display the CRV notification. Examples include whole or broken blue or other colored wine or liquor bottles and other containers.
21. Flat Glass means clear or tinted glass that is flat. Examples include glass window panes, doors and table tops, flat automotive window glass (side windows), safety glass, and architectural glass. This type does not include automotive windshields, laminated glass, or any curved glass.
22. Remainder/Composite Glass means glass that cannot be put in any other type. It includes items made mostly of glass but combined with other materials. Examples include Pyrex, Corningware, crystal and other glass tableware, mirrors, non-fluorescent light bulbs, auto windshields, laminated glass, or any curved glass.

## Metal

23. Tin/Steel Cans - CRV Bimetal Containers* means rigid containers that have steel sides and aluminum ends and that display the CRV notification. These cans are often used to store beverages.
24. Tin/Steel Cans - Other* means rigid containers made mainly of steel that are not CRV bimetal cans. These items will stick to a magnet and may be tincoated. This subtype is used to store food, beverages, paint, and a variety of other household and consumer products. Examples include canned food and beverage containers, empty metal paint cans, empty spray paint and other aerosol containers, and non-CRV bimetal containers with steel sides and aluminum ends.
25. Major Appliances means discarded major appliances of any color. These items are often enamel-coated. Examples include washing machines, clothes dryers, hot water heaters, stoves, and refrigerators. This type does not include electronics, such as televisions and stereos.
26. Used Oil Filters means metal oil filters used in motor vehicles and other engines, which contain a residue of used oil.
27. Other Ferrous means any iron or steel that is magnetic or any stainless steel item. This type does not include tin/steel cans. Examples include structural steel beams, metal clothes hangers, metal pipes, stainless steel cookware, security bars, and scrap ferrous items.
28. Aluminum Cans - CRV* means any food or beverage container that is made mainly of aluminum and that displays the CRV notification. Examples include most aluminum soda or beer cans. This subtype does not include bimetal containers with steel sides and aluminum ends.
29. Aluminum Cans - Non-CRV* means any food or beverage container that is made mainly of aluminum and that does not display the CRV notification. Examples include some pet food and meat cans.
30. Other Non-Ferrous means any metal item, other than aluminum cans, that is not stainless steel and that is not magnetic. These items may be made of aluminum, copper, brass, bronze, lead, zinc, or other metals. Examples
include aluminum window frames, aluminum siding, copper wire, shell casings, brass pipe, and aluminum foil.
31. Remainder/Composite Metal means metal that cannot be put in any other type. This type includes items made mostly of metal but combined with other materials and items made of both ferrous metal and non-ferrous metal combined. Examples include small non-electronic appliances such as toasters and hair dryers, motors, insulated wire, and finished products that contain a mixture of metals, or metals and other materials, whose weight is derived significantly from the metal portion of its construction.

## Electronics

32. Brown Goods means generally larger, non-portable electronic goods that have some circuitry. Examples include microwaves, stereos, VCRs, DVD players, large radios, and audio/visual equipment. Does not include items with video display devices.
33. Computer-Related Electronics means electronics with large circuitry that is computer-related, not including monitors. Examples include processors, keyboards, printers, fax machines, mice, disk drives, and modems.
34. Other Small Consumer Electronics means portable non-computer-related electronics with large circuitry. Examples include personal digital assistants (PDAs), cell phones (including those with a screen larger than 4 inches), phone systems, phone answering machines, portable electronic book readers (like Kindles and Nooks) and other devices for reading static text, computer games and other electronic toys, portable CD players, camcorders, digital cameras, cell phone chargers and other electronic device chargers, and other electronic devices.
35. Video Display Devices - CRT means items with video displays larger than 4 inches that contain a cathode ray tube (CRT). Examples include some televisions, computer monitors, and other items containing CRTs. The shape of the item is usually more boxy than flat.
36. Video Display Devices - Other means items with video displays larger than 4 inches that are not CRTs nor are they included in the Other Small Consumer Electronics category. Examples include some televisions, computer monitors, portable DVD players, tablet computers (like the iPad and Kindle Fire), and laptop computers. The shape of the item is usually more flat than boxy, and the device is primarily intended to display moving video, perform computing functions, or view web content.

## Plastic

37. PETE Containers - CRV* means clear or colored PET containers that display the CRV notification. When marked for identification, it bears the number " 1 " in the center of the triangular recycling symbol and may also bear the letters
"PETE" or "PET." The color is usually transparent green or clear. A PET container usually has a small dot left from the manufacturing process, not a seam. It does not turn white when bent. Examples include soda and water bottles.
38. PETE Containers - Non-CRV* means clear or colored PET containers that do not display the CRV notification. When marked for identification, it bears the number " 1 " in the center of the triangular recycling symbol and may also bear the letters "PETE" or "PET." The color is usually transparent green or clear. A PET container usually has a small dot left from the manufacturing process, not a seam. It does not turn white when bent. Examples include nonCRV juice or water bottles, some liquor bottles, cooking oil containers, food jars, pastry jars, frozen food or other trays, clamshell packaging, and aspirin bottles.
39. HDPE Containers - CRV* means natural and colored HDPE containers that display the CRV notification. This plastic is usually either cloudy white, allowing light to pass through it (natural) or a solid color, preventing light from passing through it (colored). When marked for identification, it bears the number " 2 " in the triangular recycling symbol and may also bear the letters "HDPE." Examples include some small juice bottles.
40. HDPE Containers - Non-CRV* means natural and colored HDPE containers that do not display the CRV notification. This plastic is usually either cloudy white, allowing light to pass through it (natural) or a solid color, preventing light from passing through it (colored). When marked for identification, it bears the number " 2 " in the triangular recycling symbol and may also bear the letters "HDPE." Examples include milk jugs, detergent bottles, some hair-care bottles, some margarine and yogurt tubs, clamshell packaging, empty motor oil, empty antifreeze, and other empty vehicle and equipment fluid containers.
41. Miscellaneous Plastic Containers - CRV* means plastic containers that display the CRV notification that are made of types of plastic other than HDPE or PET. Items may be made of PVC, PP, or PS or mixed resins. When marked for identification, these items may bear the number " 3 ," " 4 ," " 5 ," " 6 ," or " 7 " in the triangular recycling symbol. This subtype also includes plastic containers that do not have the triangular recycling symbol.
42. Miscellaneous Plastic Containers - Non-CRV* means plastic containers that do not display the CRV notification that are made of types of plastic other than HDPE or PET. Items may be made of PVC, PP, or PS. When marked for identification, these items may bear the number " 3 ," " 4 ," " 5 ," " 6 ," or " 7 " in the triangular recycling symbol. This subtype also includes plastic containers that do not have the triangular recycling symbol. Examples include hardware and fastener packaging, food containers such as bottles for salad dressings and vegetable oils, flexible and brittle yogurt cups, syrup bottles, margarine tubs, microwave food trays, and clamshell-shaped fast food containers. This type
also includes some shampoo containers, vitamin bottles, foam egg cartons, and clamshell-like muffin containers.
43. Plastic Trash Bags means plastic bags sold for use as trash bags, for both residential and commercial use. This type includes garbage, kitchen, compactor, can-liner, composting, yard, lawn, leaf, and recycling bags. This type does not include other plastic bags, such as shopping bags, that might have been used to contain trash.
44. Plastic Grocery and Other Merchandise Bags means plastic shopping bags used to contain merchandise to transport from the place of purchase, given out by the store with the purchase. This type includes dry cleaning bags intended for one-time use. Does not include produce bags.
45. Non-Bag Commercial and Industrial Packaging Film means film plastic used for large-scale packaging or transport packaging. Examples include shrink-wrap, mattress bags, furniture wrap, and film bubble wrap.
46. Film Products means plastic film used for purposes other than packaging. Examples include agricultural film (films used in various farming and growing applications, such as silage greenhouse films, mulch films, and wrap for hay bales), plastic sheeting used as drop cloths, and building wrap.
47. Other Film - Flexible Plastic Pouches means plastic pouches made of thicker, multi-layer flexible material. May have a flat bottom so that package would stand up on its own, but not always. Material is thicker than potato chip bags and frozen vegetable bags. Includes plastic coffee bags like Starbucks and Peet's; Capri Sun pouches; baby food pouches - may have plastic screw top; soup pouches; salad dressing pouches; wine pouches; backpacking meals in pouches; soap refill pouches; laundry detergent pouches; and other similar items.

| Other Film - Flexible Plastic Pouches Examples |  |
| :---: | :---: |
| INCLUDED - THICKER, MULTILAYER PACKAGING | EXCLUDED - THINNER, SINGLELAYER PACKAGING |
| Plastic coffee bags (Starbucks and Peet's) <br> Juice pouches (Capri Sun) <br> Baby food pouches - may have plastic screw top <br> Soup pouches <br> Salad dressing pouches <br> Wine pouches <br> Backpacking meals in pouches <br> Soap refill pouches <br> Laundry detergent pouches <br> Other similar items | Potato chip bags and similar <br> Candy wrappers <br> Tortilla bags <br> Frozen food bags (vegetables, berries) <br> Nut/snack bags <br> Shrink plastic wrappers (Slim Jim and string cheese wrappers) <br> Ziplock bags intended for home use <br> Thin produce bags as used in grocery stores <br> Newspaper bags <br> Bread bags <br> Small (2 inch) pouches for condiments (mustard, relish, etc.) <br> Yogurt tubes (Gogurt) <br> Mailing pouches, usually colored or white (not clear) (LL Bean, medication pouches) <br> $100 \%$ plastic mailing pouches with bubble wrap <br> Other similar items |

48. Other Film - Other means all other plastic film that does not fit into any other type, excluding flexible plastic pouches. Examples include other types of plastic bags (sandwich bags, zipper-recloseable bags, newspaper bags, produce bags, frozen vegetable bags, bread bags), food wrappers such as candy-bar wrappers, potato chip bags, mailing pouches, bank bags, X-ray film, metallized film (such as balloons), and plastic food wrap.
49. Durable Plastic Items - \#2 and \#5 Bulky Rigids means plastic items, other than containers or film plastic, that are large (generally larger than a soccer ball) rigid \#2 HDPE or \#5 PP plastic bulky items. These items are made to last for more than one use. These items usually bear the number 2 or 5 in the triangular recycling symbol. Examples include: crates, buckets (including 5gallon buckets), baskets, totes, large plastic garbage cans, large tubs, large storage tubs/bins (usually with lids) that don't have sharp corners, flexible (non-brittle) flower pots of 1 gallon size or larger, lawn furniture, large plastic toys, tool boxes, first aid boxes, and some sporting goods.
50. Durable Plastic Items - Other means plastic items other than containers or film plastic that are often made to last for more than one use that are not large
rigid items made from \#2 or \#5 plastics. These items may bear the numbers 1 through 7 in the triangular recycling symbol. Examples include CDs and their cases, plastic housewares such as dishes, cups, and cutlery. This type also includes building materials such as house siding, window sashes and frames, housings for electronics such as computers, televisions and stereos, fan blades, and plastic pipes and fittings.
51. Remainder/Composite Plastic means plastic that cannot be put in any other type. These items are usually recognized by their optical opacity. This type includes items made mostly of plastic but combined with other materials. Examples include auto parts made of plastic attached to metal, plastic drinking straws, foam drinking cups, plastic cups, produce trays, foam meat and pastry trays, foam packing blocks, packing peanuts, cookie trays found in cookie packages, plastic strapping, plastic lids, some kitchen ware, some toys, foam plates/bowls, window blinds, plastic lumber, insulating foam, imitation ceramics, handles and knobs, plastic string (such as used for hay bales), plastic rigid bubble/foil packaging (as for medications), small (less than 1 gallon) plant containers such as nursery pots and plant six-packs, and new Formica, new vinyl, or new linoleum.

## Other Organics

52. Food means food material resulting from the processing, storage, preparation, cooking, handling, or consumption of food. This type includes material from industrial, commercial, or residential sources. Examples include discarded meat scraps, dairy products, eggshells, fruit or vegetable peels, and other food items from homes, stores, and restaurants. This type includes grape pomace and other processed residues or material from canneries, wineries, or other industrial sources.
53. Leaves and Grass means plant material, except woody material, from any public or private landscape. Examples include leaves, grass clippings, plants, and seaweed. This type does not include woody material or material from agricultural sources.
54. Prunings and Trimmings means woody plant material up to 4 inches in diameter from any public or private landscape. Examples include prunings, shrubs, and small branches with branch diameters that do not exceed 4 inches. This type does not include stumps, tree trunks, branches exceeding 4 inches in diameter, or material from agricultural sources.
55. Branches and Stumps means woody plant material, branches, and stumps that exceed 4 inches in diameter, from any public or private landscape.
56. Manures means manure and soiled bedding materials from large domestic, farm, or ranch animals. Examples include manure and soiled bedding from animal production operations, racetracks, riding stables, animal hospitals, and other sources. Does not include feces from small household pets such as dogs and cats.
57. Textiles means items made of thread, yarn, fabric, or cloth. Examples include clothes, fabric trimmings, draperies, and all natural and synthetic cloth fibers. This type does not include cloth-covered furniture, mattresses, leather shoes, leather bags, or leather belts.
58. Carpet means flooring applications consisting of various natural or synthetic fibers bonded to some type of backing material. This type does not include carpet padding or woven rugs with no backing.
59. Remainder/Composite Organic means organic material that cannot be put in any other type. This type includes items made mostly of organic materials, but combined with other material types. Examples include leather items, cork, hemp rope, garden hoses, rubber items, hair, carpet padding, cigarette butts, diapers, feminine hygiene products, small wood products (such as Popsicle sticks and toothpicks), sawdust, agricultural crop residues, and animal feces from small household pets such as dogs and cats.

## Inerts and Other

60. Concrete means a hard material made from sand, aggregate, gravel, cement mix, and water. Examples include pieces of building foundations, concrete paving, and concrete/cinder blocks. This category includes concrete with a steel internal structure composed of reinforcing bars (re-bar) or metal mesh.
61. Asphalt Paving means a black or brown, tar-like material mixed with aggregate used as a paving material.
62. Asphalt Roofing means composite shingles and other roofing material made with asphalt. Examples include asphalt shingles and attached roofing tar and tar paper.
63. Clean Dimensional Lumber means unpainted new or demolition dimensional lumber. Includes materials such as $2 \times 4 \mathrm{~s}, 2 \times 6 \mathrm{~s}, 2 \times 12 \mathrm{~s}$, and other residual materials from framing and related construction activities. May contain nails or other trace contaminants.
64. Clean Engineered Wood means unpainted new or demolition scrap from sheeted goods such as plywood, particleboard, wafer board, oriented strand board, and other residual materials used for sheathing and related construction uses. May contain nails or other trace contaminants.
65. Clean Pallets and Crates means unpainted wood pallets, crates, and packaging made of lumber/engineered wood.
66. Other Wood Waste means wood waste that cannot be put into any other material type. This type may include untreated/unpainted scrap from production of prefabricated wood products such as wood furniture or cabinets, untreated or unpainted wood roofing and siding, painted or stained wood, and treated wood.
67. Gypsum Board means interior wall covering made of a sheet of gypsum sandwiched between paper layers. Examples include used or unused broken or whole sheets. Gypsum board may also be called sheetrock, drywall, plasterboard, gypboard, gyproc, or wallboard. Includes painted gypsum board.
68. Rock, Soil and Fines means rock pieces of any size and soil, dirt, and other matter. Examples include rock, stones, sand, clay, soil and other fines. This type also includes nonhazardous contaminated soil.
69. Remainder/Composite Inerts and Other means inerts and other material that cannot be put in any other type. This type may include items from different types combined, which would be very hard to separate. Examples include brick, ceramics, tiles, toilets, sinks, dried paint not attached to other materials, and fiberglass insulation. This type may also include demolition debris that is a mixture of items such as plate glass, wood, tiles, gypsum board, synthetic counter tops, fiber or composite acoustic ceiling tiles, and aluminum scrap.

## Household Hazardous Waste (HHW)

70. Paint means containers with paint in them. Examples include latex paint, oilbased paint, and tubes of pigment or fine art paint. This type does not include dried paint, empty paint cans, or empty aerosol containers.
71. Vehicle and Equipment Fluids means containers with fluids used in vehicles or engines, except used oil. Examples include used antifreeze and brake fluid. This type does not include empty vehicle and equipment fluid containers.
72. Used Oil means the same as defined in Health and Safety Code section 25250.1(a). Examples include spent lubricating oil such as crankcase and transmission oil, gear oil, and hydraulic oil.
73. Batteries means any type of battery including both dry cell, rechargeable, and lead acid. Examples include car, flashlight, small appliance, watch, and hearing aid batteries.
74. Mercury-Containing Items - Not Lamps means items other than lamps that are readily identifiable as containing mercury such as thermostats and thermometers.
75. Lamps - Fluorescent and LED means both compact and tube-style fluorescent lights, and LED lights.
76. Remainder/Composite Household Hazardous means household hazardous material that cannot be put in any other type. This type also includes household hazardous material that is mixed. Examples include household hazardous waste such as pesticides, caustic cleaners, sharps
(needles), medications, and nutritional supplements which, if improperly put in the solid waste stream, may present handling problems or other hazards.

## Special Waste

77. Ash means a residue from the combustion of any solid or liquid material. Examples include ash from fireplaces, incinerators, biomass facilities, waste-to-energy facilities, and barbecues. This type also includes ash and burned debris from structure fires.
78. Treated Medical Waste means medical waste that has been processed in order to change its physical, chemical, or biological character or composition, or to remove or reduce its harmful properties or characteristics, as defined in Section 25123.5 of the Health and Safety Code.
79. Bulky Items means large hard-to-handle items that are not defined elsewhere in the material types list, including furniture, mattresses, and other large items. Examples include all sizes and types of furniture, box springs, and base components.
80. Tires means vehicle tires. Tires may be pneumatic or solid. Examples include tires from trucks, automobiles, motorcycles, heavy equipment, lawn mowers, and bicycles.
81. Remainder/Composite Special Waste means special waste that cannot be put in any other type. Examples include asbestos-containing materials such as certain types of pipe insulation and floor tiles, auto fluff, auto bodies, trucks, trailers, truck cabs, untreated medical waste (such as tubes, oxygen masks, and medical instruments), and artificial fireplace logs.

## Mixed Residue

82. Mixed Residue means material that cannot be put in any other type or category. This category includes mixed residue that cannot be further sorted. Examples include clumping kitty litter, cosmetics, partially filled containers of non-food consumer products, and residual material from a material recovery facility or other sorting process that cannot be put in any other material type, including remainder/composite types.

## Material Type Examples

## Other Film - Flexible Plastic Pouches

## Remainder/Composite Paper - Rigid Food and Beverage Cartons

## Recoverability Groups

The 82 materials used for sorting are assigned to the five recoverability groups as shown in Table 95. The curbside recyclable list was based on research done by CalRecycle on materials listed as acceptable in local jurisdiction programs.

Table 95. Recoverability Group Assignments

| Curbside Recyclable | Other Recyclable | Recoverable Inerts |
| :---: | :---: | :---: |
| Uncoated Corrugated Cardboard <br> Paper Bags <br> Newspaper <br> White Ledger Paper <br> Other Office Paper <br> Magazines and Catalogs | Major Appliances <br> Used Oil Filters <br> Other Ferrous <br> Other Non-Ferrous <br> Computer-related Electronics <br> Other Small Consumer Electronics | Concrete <br> Asphalt Paving <br> Asphalt Roofing <br> Gypsum Board <br> Rock, Soil and Fines |
| Phone Books and Directories | Video Display Devices - CRT | Other Materials |
| Other Miscellaneous Paper - Other <br> Clear Glass Bottles and Containers - CRV <br> Clear Glass Bottles and Containers - Non-CRV <br> Green Glass Bottles and Containers - CRV <br> Green Glass Bottles and Containers - Non-CRV <br> Brown Glass Bottles and Containers - CRV <br> Brown Glass Bottles and Containers - Non-CRV <br> Other Colored Glass Bottles and Containers - CRV <br> Other Colored Glass Bottles and Containers - Non-CRV <br> Tin/Steel Cans - CRV Bimetal Containers <br> Tin/Steel Cans - Other <br> Aluminum Cans - CRV | Video Display Devices - Other <br> Plastic Grocery and Other Merchandise Bags <br> Non-Bag Commercial and Industrial Packaging Film <br> Durable Plastic Items - \#2 and \#5 Bulky Rigids <br> Textiles <br> Carpet <br> Paint <br> Vehicle and Equipment Fluids <br> Used Oil <br> Batteries <br> Tires | Remainder/Composite Paper - Rigid Food \& Beverage Cartons <br> Remainder/Composite Paper - Other <br> Flat Glass <br> Remainder/Composite Glass <br> Remainder/Composite Metal <br> Brown Goods <br> Plastic Trash Bags <br> Film Products <br> Other Film - Flexible Plastic Pouches <br> Other Film - Other <br> Durable Plastic Items - Other <br> Remainder/Composite Plastic |
| Aluminum Cans - Non-CRV | Compost/Mulch | Remainder/Composite Organic |
| ```PETE Containers - CRV PETE Containers - Non-CRV HDPE Containers - CRV HDPE Containers - Non-CRV``` | Other Miscellaneous Paper - Compostable Remainder/Composite Paper - Compostable Food Leaves and Grass | Other Wood Waste <br> Remainder/Composite Inerts and Other <br> Mercury-Containing Items - Not Lamps <br> Lamps - Fluorescent and LED |
| Miscellaneous Plastic Containers - CRV | Prunings and Trimmings | Remainder/Composite Household Hazardous |
| Miscellaneous Plastic Containers - Non-CRV | Branches and Stumps <br> Manures <br> Clean Dimensional Lumber <br> Clean Engineered Wood <br> Clean Pallets \& Crates | Ash <br> Treated Medical Waste <br> Bulky Items <br> Remainder/Composite Special Waste <br> Mixed Residue |

The 126 materials used in the Task 3 analysis are assigned to the five recoverability groups as shown in Table 96. The curbside recyclable list was based on research done by CalRecycle on materials listed as acceptable in local jurisdiction programs.

Table 96. Recoverability Group Assignments for Task 3 Analysis

## Contamination Subsort Definitions

The contamination categories were defined as follows:

Clean. Material not soiled or contaminated in the bin that could reasonably be expected to be recycled in recycling programs targeting the material without special processing, cleaning, and/or repair. For example, a clean plastic soda bottle, dry office paper, or a clean, dry, and still folded newspaper.

Figure 75. Clean Materials

Figure 76. Bin-Contaminated Materials

Source-Contaminated. Material that appears to have been contaminated through use or prior to disposal. For example, cardboard with a lot of tape, newspaper covered with paint used for masking, newspaper used to wrap fish, paper plates with food residue, or peanut butter jars with residue.

## Material Groupings for Task 3 Analysis

Table 97 lists the standard recoverable materials for the Task 3 analysis. Materials marked with an X were considered recovered for the purposes of the analysis.

## Appendix C: Description of Calculations

This appendix details the calculations used to calculate the composition and quantity data. The quantity and composition data were calculated at the statewide level for each waste stream within a group and for the statewide overall commercial waste stream. The calculations were performed the same for the disposed, curbside recycle and curbside organics waste streams as well as other diversion materials collected in bins, roll offs, compactors, or carts. This section includes a special note regarding the calculation for materials not collected in bins, roll offs, compactors, or carts; a note for sites with mixed-waste processing, and a note for the T3 calculations.

## Calculating the Waste Stream Quantities

## Industry Group Quantities

Annual tonnage for each industry group was estimated based on actual measurement of the amount of material at a generator site shortly before the regular pick-up by the hauler. The procedure for measuring and calculating disposal or diversion per employee for a typical site in each industry group is described below. Figure 78 following the explanation provides a graphical illustration of this process. The following steps describe the disposed waste quantification process; however, diversion quantities for materials placed in bins were calculated using the same process. Materials diverted apart from the bins were also included in the total diversion calculations for each industry group.

1. Disposed Waste Volume Measurements: The field crew recorded the length, width, and height to the nearest inch for all disposed waste at each site. The volume of the disposed waste at each site was the sum of all volumes for each waste container (if there was more than one container on-site), in cubic inches. In calculations this quantity was noted as $\mathrm{V}_{\mathrm{o}}$.
2. Disposed Waste Accumulation Time: During initial recruitment screening calls, recruiters asked the responsible party at the site for information to determine waste accumulation time, including: the business operating hours, the time the waste containers were last collected by the hauler (or regular collection schedule), and when trash was regularly taken outside to dumpsters. While onsite, the field crew verified the critical information. This information was used to calculate (1) the hours of accumulation for the observed disposed waste volume ( $\mathrm{A}_{\mathrm{o}}$ ) and (2) the total hours of disposed waste accumulation time per year ( $\mathrm{A}_{\mathrm{A}}$ ). These two numbers were used to calculate the percent of the annual waste generation (Ap) that was observed during the measurement.

For a site with the following waste information:
Hours waste was generated: 9 a.m. to 5 p.m., Monday through Saturday Waste was transported to dumpsters: Continuously Waste was collected: Monday before 9 a.m.
Day and time of accumulation measurement: Friday, 3 p.m.

The following is an example of the hours of accumulation for the observed disposed waste volume calculation:

Ao $=8$ hrs Monday +8 hrs Tuesday +8 hrs Wednesday +8 hrs Thursday +6 hrs Friday
Ao $=38 \mathrm{hrs}$
The following is an example of the total hours of disposed waste accumulation time per year calculation:
$A_{A}=8$ hrs per day $\times 6$ days per week $x 52$ weeks per year
$A_{A}=2,496$ hrs
Thus, the percent of the annual waste generation that was observed during the measurement is:

$$
\begin{aligned}
& A_{P}=A_{0} / A_{A} \\
& A_{P}=38 \mathrm{hrs} / 2,496 \mathrm{hrs} \\
& A_{P}=1.52 \%
\end{aligned}
$$

3. Annual Disposed Waste Volume: The volume of the disposed waste (calculated in step 1) was divided by the percent of the annual waste generation (calculated in step 2) during the observed period to determine the annual disposed waste volume $\left(\mathrm{V}_{\mathrm{A}}\right)$. This was calculated in cubic yards per year for each site. The following is an example for a site with a Vo of $46,000 \mathrm{in}^{3}$. Note: 1 cubic yard $=46,656 \mathrm{in}^{3}$.

$$
\begin{aligned}
& V_{O}=46,000 \mathrm{in}^{3} / 46,656 \mathrm{in}^{3} / \mathrm{yd}^{3}=0.99 \mathrm{yd}^{3} \\
& V_{A}=V_{0} / \mathrm{AP}_{P} \\
& V_{A}=0.99 \mathrm{yd}^{3} / \mathrm{A}_{P} \\
& V_{A}=0.99 \mathrm{yd}^{3} / 0.0152 \\
& V_{A}=64.9 \mathrm{yd}^{3}
\end{aligned}
$$

To confirm the accuracy of the measurements, the calculated annual disposed waste volume was compared to the volume estimated by multiplying the container size by the number of annual collections. When the annual disposed waste volume based on research measurements was more than 150 percent of the volume based on the container size and collection frequency, the estimate based on measurements was replaced with the estimated volume based on the container size and collection frequency.
4. Reported Disposed Waste Tons: When a site uses a compactor for its disposed waste, the recruiters determined the annual tonnage at a site by (1) asking the person responsible for the data at the site or (2) using hauler records.

Tonnage data were obtained in tons per time period. In these cases, the tonnage data were used instead of the volume estimates.
5. Volume of Sample: The volume of a sample was measured in one of three ways:
a. Measurements of waste in the dumpster taken before and after removing waste for a sample to calculate volume of removed waste.
b. When accessing the container was not possible, as was the case with compactors, volume measurements were recorded in gallons based on the amount of material that was deposited in the containers used to transport the disposed waste sample from the site to the sorting facility.
c. If neither of the methods described above were possible, the researchers measured the volume of the sample after it was dumped on the sorting floor.

All sample volume measurements were converted into cubic yards. Samples and sample volume measurements were collected for all identified disposed waste substreams at a given site.
6. Weight of Sample: The sample weight was calculated as the sum of all the sorted components.
7. Average Density of Disposed Waste per site: The average disposed waste density per site was calculated for each site by dividing the sum of all sample weights for a given site by the sum of all sample volumes for that site.

$$
\text { Average Density }{ }_{g}=\frac{\sum_{i} w_{i, g}}{\sum_{i} v_{i, g}}
$$

where:
$g$ represents a given site
$i$ denotes each individual sample
$w_{i, g}$ represents the weight of sample $i$ at site $g$
$v_{i, g}$ represents the volume of sample $i$ at site $g$
8. Annual Disposed Waste Quantity: The average disposed waste density per site was used to convert annual disposed waste volume measurements for each site into annual tons.

For sites with multiple disposed waste substreams, each substream was measured separately, then added together to calculate a total annual disposed waste quantity for each site.
9. Average Density of Disposed Waste per Industry Group: The group density was calculated for small sites and large sites separately. The average disposed
waste density was calculated for each industry group by dividing the sum of all annual disposed waste quantities at all small sites for a given industry group by the sum of all annual disposed waste volumes at all small sites for that industry group.

$$
\text { Average Density }{ }_{g}=\frac{\sum_{i} w_{i, g}}{\sum_{i} v_{i, g}}
$$

where:
$g$ represents a given industry group
$i$ denotes each individual site
$w_{i, g}$ represents the annual quantity of disposed waste at site $i$ in group $g$
$v_{i, g}$ represents the annual volume of disposed waste at site $i$ in group $g$
The same calculation was repeated for the large sites. The overall group density was the weighted average of the small and large densities, weighted by the group's statewide employment at small sites and at large sites.
10. Tons per Employee per Year: Information was gathered from each site regarding the number of employees, expressed as Full Time Equivalents (FTEs). The annual disposed waste quantity for each site was divided by the FTE figure for that site to calculate a tons per employee per year (TPEPY) figure for each site. The group TPEPY was calculated for small sites and large sites separately. The sum of the annual disposed waste quantity for all small sites in a group was divided by the sum of the FTEs for all small sites in that group to generate the small sites TPEPY for that industry group. The same calculation was performed for large sites. The overall group TPEPY was the weighted average of the small and large TPEPY, weighted by the group's statewide employment at small sites and at large sites. TPEPY was the primary method used to calculate annual tons for all sites and groups except multi-family. Multi-family annual tons was calculated on a tons per unit per year basis.

For the following groups, disposal was also correlated with the noted factors. The number of sites used in the correlative factor calculations for each of these groups is note in Table 98.

All Groups: actual employment instead of FTEs
Group 1: number of annual visitors
Group 3: number of staff, number of students, and number of school days
Group 4: numbers of rooms
Group 8: number of beds
Group 13 and Group 14: per thousand square feet of building space.

Table 98. Sites Used in Additional Correlatives Calculations

|  |  | Number of Sites <br> Included in Correlative <br> Calcs |  |
| :--- | :--- | :---: | :---: |
|  | Correlative Units | Diverted <br> Andustry Group | Disposed |
| Education | Tons per 100 Students per Year | 40 | 21 |
| Hotels \& Lodging <br> Hospital, Nursing, \& Residential <br> Care Facilities <br> Services - Management, <br> Administrative, Support, \& Social <br> Services - Professional, Technical, <br> \& Financial <br> Tons Tons per per 1,000 Bed per Year | Tons per Guest Room per Year | 46 | 26 |

Sites selected for Task 4 with zero diversion were included in the quantity calculations. Their quantity was calculated as zero tons, but their employment was included in step nine of the quantification calculation.

The study also calculated a yards per employee per year (YPEPY) figure for each group. The YPEPY skips steps 4-9 in the above calculation, it is simply the sum of the annual disposed waste volume for all small sites in a group was divided by the sum of the FTEs for all small sites in that group. The same calculation was performed for the large sites. The overall group YPEPY was the weighted average of the small and large YPEPY, weighted by the group's statewide employment at small sites and at large sites.

Because not every generator site was able to provide complete annual quantity and volume data, the generator sites included in the TPEPY calculations are slightly different than the sites included in the YPEPY calculations, which are again slightly different than the sites used in the density calculations. For this reason, trying to use any two of those metrics to calculate the third will results in a slightly different figure than those published in this report.

The material quantification process is summarized in Figure 78.

Figure 78. Material Quantification Process
Site Visit Measurements for Disposed Waste Volume Calculations

## Statewide Commercial Sector Overall Quantities

The statewide commercial sector overall TPEPY was calculated by aggregating the annual tons associated with each group and dividing by the total number of employees statewide. The following list describes the calculations for the disposed waste stream but the same process was followed for any waste stream (disposal, curbside recycle, etc.).

1. Multiply the group-specific TPEPY (calculated in step 10 of the previous list) by the total number of employees statewide in that group (from Table 80) to calculate the annual disposal for the group.
2. Sum the annual statewide disposal for all groups to calculate the statewide commercial sector overall disposal.
3. Divide the statewide commercial sector overall disposal by the total number of employees statewide to calculate the statewide commercial sector overall TPEPY.

$$
\frac{\sum_{i}\left(T P E P Y_{i} * \text { Employment }_{i}\right)}{\text { Employment }_{\text {state }}}
$$

for $i=1$ to $n$, where $n=$ number of industry groups

## Special Note for Non-Containerized Collection

We anticipated that some diverted materials, such as pallets, toner cartridges, food and furniture donations, and other items not collected in bins, roll-offs, compactors, or carts could not be readily quantified using the above method. These materials were frequently diverted through non-curbside programs such as self-hauling, back-hauling, and informal collection networks. For these situations the field crew quantified these materials using whatever means were appropriate for the situation including:

- Annual records indicating the amount diverted in tons.
- Using direct weights instead of volumes for most pure streams (sourceseparated items such as pallets, toner cartridges, bales of cardboard). For example, the field crew visited a business open seven days per week that had six pallets on-site that accumulated over six days and weighed 180 pounds in total. The field crew estimated that the business diverts 365 pallets in one year at 30 pounds per pallet for a total of 5.5 tons per year.
- Estimates from staff at the site. Often non-curbside materials were collected on variable schedules so the field crew relied on accumulation time ("this material has been here about six weeks") and collection schedule ("we get this picked up about every three months") estimates from the staff.

Annual quantity estimates of non-curbside materials were scaled to TPEPYs using the same calculation as other disposed and diverted materials (detailed in step 10, above).

## Special Note for Sites with Mixed-Waste Processing

The analysis made special considerations for sites where the disposed material is sent to a mixed-waste processor (MWP). For any particular site with a MWP, the composition of the disposed stream samples at that site were adjusted to reflect the sorting efficiency and sorted commodities at the MWP where that site's materials are tipped. When MWP-specific performance data was not available, industry averages and professional opinions were applied. The materials expected to be diverted at the MWP from that site are included in the other diversion stream from that site.

For example, say disposal at business $A$ is 50 percent newspaper and 50 percent food, and the local MWP captures 100 percent of the inbound newspaper and 0.0 percent of the inbound food. In that case, the site's disposed sample composition would be adjusted to reflect the diversion of the newspaper. The new disposed sample composition would be 100 percent food, and the annual disposal quantity would be reduced likewise. In the same manner, the annual other diversion quantities would be increased to reflect the diverted newspaper and the other diversion composition adjusted accordingly.

## Calculating the Waste Stream Compositions

This section describes the general calculation approach that was used when producing the following:

- estimated composition on a mean percentage basis
- estimated composition on a weighted average percentage basis

Details of the calculation method varied slightly among the industry groups studied, since there were inevitably irregularities and unexpected situations reflected in the data. The following descriptions reference the disposed waste; however, the diversion composition was calculated using the same process.

## Industry Group Composition

## Mean Percent Estimates

For a given industry group, the composition estimate denoted by $r_{j}$ represents the ratio of the material's weight to the total weight of all the samples in the stratum. It was derived by summing each material's weight across all of the selected samples belonging to a given industry group and dividing by the sum of the total weight of waste for all of the samples from that industry group, as shown in the following equation:

$$
r_{j}=\frac{\sum_{i} c_{i j}}{\sum_{i} w_{i}}
$$

where:
$c=$ weight of particular material
$w=$ sum of all material weights
for $i=1$ to $n$, where $n=$ number of selected samples
for $j=1$ to $m$, where $m=$ number of materials

The confidence interval for this estimate was derived in two steps. First, the variance around the estimate was calculated, accounting for the fact that the ratio included two random variables (the material and total sample weights). The variance of the ratio estimator equation follows:

$$
\operatorname{Var}\left(r_{j}\right) \approx\left(\frac{1}{n}\right)\left(\frac{1}{\bar{w}^{2}}\right)\left(\frac{\sum_{i}^{\left(c_{i j}-r_{j} w_{i}\right)^{2}}}{n-1}\right)^{*}
$$

where:

$$
\bar{w}=\frac{\sum_{i} w_{i}}{n}
$$

*For more information regarding the variance calculation, please refer to William G. Cochran, Sampling Techniques, 3rd Edition, John Wiley \& Sons, Inc., Indianapolis, Indiana, 1977.

Second, the confidence interval at the 90 percent confidence level was calculated for a material's mean as follows:

$$
r_{j} \pm\left(z \sqrt{\operatorname{Var}\left(r_{j}\right)}\right)
$$

where $z=$ the value of the $z$-statistic (1.645) corresponding to a 90 percent confidence level.

## Weighted Averages

For all groups, data was gathered from subgroups defined by the size of the businesses. These groups and subgroups are described in Table 81. In addition, the Medical \& Health group was divided into two NAICS-defined subgroups. The estimated annual tons corresponding to each subgroup was used as weighting factors.

In the equation below, $\mathrm{O}_{\mathrm{j}}$ represents the mean percent estimate for material $j$ in the waste disposed by an industry group that was made up of multiple subgroups, which are numbered $1,2,3$, etc. The relative weighting factors for each subgroup, expressed as percentages of the entire annual tonnage for the industry group statewide, are represented by the variables $p_{1}, p_{2}, p_{3}$, etc. The mean estimate of the percent of the disposed waste stream corresponding to the material $j$ for each subgroup was represented by the variables $\mathrm{r}_{\mathrm{j} 1}, \mathrm{r}_{\mathrm{i} 2}, \mathrm{r}_{\mathrm{i} 3}$, etc.

$$
O_{j}=\left(p_{1} * r_{j 1}\right)+\left(p_{2} * r_{j 2}\right)+\left(p_{3} * r_{j 3}\right)+\ldots
$$

where:
$O_{j}=$ the mean percent estimate for material $j$ in the waste disposed by the noted group
$p=$ the proportion of annual tons contributed by the noted size groups $r=$ ratio of material weight to total waste weight in the noted size groups for $j=1$ to $m$, where $m=$ number of materials

For example, business locations belonging to a particular industry group might be identified as having two size categories, with the "small" locations corresponding to 100,000 tons, and the "large" locations including 150,000 tons. From the waste sampling data, the percentage of cardboard in the disposed waste may be different for the two size categories: 6 percent at the small locations and 2 percent at the large locations. The weighted combination of the composition findings would be performed as follows:

Proportion of tons from small establishments:

$$
p_{\text {small }}=\frac{100,000}{100,000+150,000}=0.4
$$

Proportion of tons from large establishments:

$$
p_{\text {large }}=\frac{150,000}{100,000+150,000}=0.6
$$

Overall percentage calculation for cardboard at both types of establishments:

$$
O_{\text {cardboard }}=(0.4 \times 6 \%)+(0.6 \times 2 \%)=3.6 \%
$$

The variance of the weighted average was calculated:

$$
\operatorname{Var}_{j}=\left(p_{1}^{2} * \hat{V}_{r_{j 1}}\right)+\left(p_{2}^{2} * \hat{V}_{r_{j 2}}\right)+\left(p_{3}^{2} * \hat{V}_{r_{j 3}}\right)+\ldots
$$

where:

$$
\begin{aligned}
& \hat{V}_{r_{j}}=\text { the variance of the composition estimate for the material in the } \\
& \text { indicated size group }
\end{aligned}
$$

## Addressing Sites with Multiple Substreams

For sites where a particular waste stream (disposals, curbside recycle, etc.) was composed of multiple substreams, data from the multiple substream samples were combined using a weighted calculation process to create a composite sample that reflects the composition of all substreams at the site. The example below indicates how this was done for a site with multiple disposal substreams; however, the calculation was the same regardless of the waste stream. This method was particularly useful for the Other Diversion stream, which was frequently composed of many substreams (ink toner, self-haul of CRV containers, furniture donations, etc.).

In the formula below, $O_{j}$ represents the mean percent estimate for material $j$ in the waste disposed by a site that was made up of multiple substreams, which are numbered $1,2,3$, etc. The relative weighting factors for each substream, expressed as percentages of annual tonnage at the site, are represented by the variables $p_{1}, p_{2}, p_{3}$, etc. The mean estimate of the percent of the disposed waste stream corresponding to the material $j$ for each substream was represented by the variables $r_{j 1}, r_{j 2}, r_{j 3}$, etc.

$$
O_{j}=\left(p_{1} * r_{j 1}\right)+\left(p_{2} * r_{j 2}\right)+\left(p_{3} * r_{j 3}\right)+\ldots
$$

where:
$O_{j}=$ the mean percent estimate for material $j$ in the waste disposed at the site
$p=$ the proportion of tonnage contributed by the noted substream
$r=$ ratio of material weight to total waste weight in the noted substream for $j=1$ to $m$, where $m=$ number of materials

The composite sample was based on a weighted average of the composition from each substream as in the example hotel with two substreams below. Figure 79 illustrates the waste substreams at the hotel.

Figure 79. Example Scenario for Addressing Sites with Multiple Substreams

The first substream was the guest rooms waste representing 60 percent of all of the hotel's disposed waste, and the second substream was the kitchen waste substream representing the other 40 percent of waste disposed at the hotel. The weighted combination of the composition findings was performed as follows:

Proportion of tons from guest rooms: 60 percent
Proportion of tons from kitchens: 40 percent
Overall percentage calculation for newspaper at the site:

$$
O_{\text {newspaper }}=(0.6 * 80 \%)+(0.4 * 30 \%)=60 \%
$$

The resulting sets of material composition percentages were used to construct a "composite sample" for the entire hotel. To keep the composite sample in proportion to other samples in the data set, the composite sample was set to equal the average weight of the actual waste samples obtained and sorted from the specific site.

In the hotel example, if the actual guest room waste sample weighs 250 pounds, and the actual kitchen waste sample weighs 230 pounds, then the material weights in the calculated composite sample totaled the average of those two figures, or 240 pounds. This average weight was then multiplied by the composite sample material percentages to calculate a new set of sample weights for the composition analysis (described above). The material weight for newspaper in the composite sample was 60 percent of 240 pounds, or 144 pounds.

## Statewide Commercial Sector Overall Composition

The statewide commercial sector overall composition was the weighted average of the individual group and subgroup compositions. Annual tons in each group and subgroup statewide were used as the weighting factors. The calculation was completed as follows:

$$
O_{j}=\left(p_{1} * r_{j 1}\right)+\left(p_{2} * r_{j 2}\right)+\left(p_{3} * r_{j 3}\right)+\ldots
$$

where:
$O_{j}=$ the mean percent estimate for material $j$ in the waste disposed statewide
$p=$ the proportion of tons contributed by the noted subgroup
$r=$ ratio of material weight to total waste weight in the noted subgroup for $j=1$ to $m$, where $m=$ number of materials

The variance of the weighted average was calculated:

$$
\operatorname{VarO}_{j}=\left(p_{1}^{2} * \hat{V}_{r_{1}}\right)+\left(p_{2}^{2} * \hat{V}_{r_{2}}\right)+\left(p_{3}^{2} * \hat{r}_{r_{3}}\right)+\ldots
$$

where:
$\hat{V}_{r_{j}}=$ the variance of the composition estimate for the material $j$ in the disposed waste statewide.

## Calculating Waste Generation

Total waste generation was the sum of all disposal and diversion activities. It was calculated at the group level and for the commercial sector statewide.

## Industry Group Generation

## Quantity Calculations

The generation for an individual group was the sum of that group's statewide disposal and diversion. The calculation was completed as follows:

$$
G_{j}=T_{D j}+T_{C R j}+T_{C O j}+T_{O D j}
$$

Where:
$G_{j}=$ Statewide generation for material $j$
$T_{D}=$ Statewide disposed tons for material $j$
$T_{C R}=$ Statewide curbside recycle tons for material $j$
$T_{C O}=$ Statewide curbside organics tons for material $j$
$T_{O D}=$ Statewide other diversion tons for material $j$
for $j=1$ to $m$, where $m=$ number of materials

## Mean Percent Estimates

For a given industry group, the composition estimate denoted by $r_{i j}$ represented the ratio of the material's generation to the total generation in the industry group. It was derived by calculating the statewide generation for a particular material in a given industry group ( $G_{i j}$ ) and dividing by the total generation for all materials in that industry group, as shown in the following equation:

$$
r_{j}=\frac{G_{j}}{G_{w}}
$$

where:
$r_{j}=$ the proportion of annual generation for material $j$ in group $i$
$G_{j}=$ Annual generation for material $j$ in group $i$
$G_{w}=$ sum of all material weights in group $i$
for $j=1$ to $m$, where $m=$ number of materials

## Statewide Commercial Sector Overall Generation

## Quantity Calculations

The statewide commercial sector overall generation was the sum of disposal and diversion from all groups statewide. The calculation was completed as follows:

$$
G_{i j}=T_{D i j}+T_{C R i j}+T_{C O i j}+T_{O D i j}
$$

Where:
$G=$ Statewide generation for material $j$
$T_{D}=$ Statewide disposed tons for material $j$
$T_{C R}=$ Statewide curbside recycle tons for material $j$
$T_{C O}=$ Statewide curbside organics tons for material $j$
$T_{O D}=$ Statewide other diversion tons for material $j$
for $j=1$ to $m$, where $m=$ number of materials
for $i=1$ to $n$, where $n=$ number of industry groups

## Mean Percent Estimates

Statewide, the composition estimate denoted by $r_{i j}$ represents the ratio of the material's statewide commercial sector overall generation to the total statewide commercial sector generation. It was derived by calculating the statewide generation for a particular material across all industry groups ( $G_{i j}$ ) and dividing by the total generation for all materials statewide, as shown in the following equation:

$$
r_{i j}=\frac{G_{i j}}{G_{i w}}
$$

where:

$$
\begin{aligned}
& r_{i j}=\text { the proportion of annual generation for material } j \\
& G_{i j}=\text { Annual generation for material } j \\
& G_{i j}=\text { sum of all material weights in group } i \\
& \text { for } j=1 \text { to } m \text {, where } m=\text { number of materials } \\
& \text { for } i=1 \text { to } n \text {, where } n=\text { number of industry groups }
\end{aligned}
$$

## Special Note for Task 3 Analysis

The quantity and rate calculations for Task 3 were completed slightly differently than for the other tasks in this study. The Task 3 analysis required calculating for each industry group and multi-family:

1. The quantity of material diverted through curbside programs,
2. The quantity of material disposed from businesses and multi-family with a curbside diversion container,
3. The composition of material diverted through curbside programs,
4. The composition of material disposed from businesses and multi-family with a curbside diversion container,
5. The proportion of clean and contaminated standard recoverable materials in the curbside diversion containers, and
6. The proportion of clean and contaminated standard recoverable materials in the disposal containers.

Items one and three were calculated as part of Task 4.
Item four was calculated by completing a composition analysis of the disposed waste including only the sites with curbside diversion in the composition calculations. This composition was completed following the process spelled out in Calculating the Waste Stream Compositions section of this appendix.

Items five and six were calculated using the information collected during the contamination subsorts at sites selected for the Task 3 analysis. Once the disposed and curbside diversion compositions were calculated, the clean and contaminated proportions calculated from the contamination subsorts were applied to the composition estimates. For example:

If:
based on the curbside recycling sampling, newspaper was 12 percent of the medical \& health curbside recycling stream
and if:
based on the contamination subsorts, the field crew determined that 50 percent of the newspaper in the medical \& health sites' recycling bin was clean and 50 percent was source-contaminated

Then
6 percent of the medical health curbside recycling stream was clean newspaper and 6 percent was source contaminated newspaper.

For businesses, item two was calculated using the following steps:

1. The curbside recycling and curbside organics TPEPYs were calculated using only the sites with curbside diversion containers following the calculations spelled out in the Calculating the Waste Stream Quantities section of this appendix. The TPEPYs calculated in this step were greater than the TPEPYs calculated in Task 4 because the annual curbside diversion quantities remain constant (since by definition the total quantity of curbside diversion was diverted from businesses with curbside diversion) but the number of employees has been reduced (since this analysis excludes employees at sites without curbside diversion that were included in the Task 4 analysis).
2. The statewide curbside diversion tons were then divided by the curbside diversion TPEPY at sites with curbside diversion to estimate the number of employees statewide with curbside diversion.
3. The disposed TPEPY was calculated using only the sites with curbside diversion containers following the calculations spelled out in the Calculating the Waste Stream Quantities section of this appendix. The TPEPYs calculated in this step were expected to be lower than the TPEPYs calculated in Task 2 because presumably sites with curbside diversion containers put less material in their disposal containers than sites without curbside diversion containers.
4. The statewide annual disposed waste quantity from sites with curbside diversion was calculated by multiplying the number of employees calculated in step two by the special disposed TPEPY calculated in step three.

For multi-family, item two was calculated using the following steps:

1. The number of multi-family units statewide with curbside diversion was estimated by applying the proportion of units recruited with curbside diversion to the total number of units statewide.
2. The disposed TPUPY (tons per unit per year) was calculated using only the sites with curbside diversion containers following the calculations spelled out in the Calculating the Waste Stream Quantities section of this appendix. The TPUPYs calculated in this step were expected to be lower than the TPUPYs calculated in Task 2 because presumably multi-family sites with curbside diversion containers put less material in their disposal containers than multi-family sites without curbside diversion containers.
3. The statewide annual disposed waste quantity from multi-family sites with curbside diversion was calculated by multiplying the number of units calculated in step one by the special disposed TPUPY calculated in step two.

This process was repeated until for each industry group and multi-family we had:

1. The quantity of material diverted through curbside programs,
2. The quantity of material disposed from sites with a curbside diversion container,
3. The composition of material, including contamination levels, diverted through curbside programs, and
4. The composition of material, including contamination levels, disposed from sites with a curbside diversion container.

This data allowed us to calculate the quantities and composition from sites with curbside diversion for the overall commercial sector following the calculations spelled out in the Statewide Commercial Sector Overall Quantities and Statewide Commercial Sector Overall Composition sections of this appendix.

## Appendix D: Field Forms

## Node Recruitment

This section includes the forms used to recruit the nodes.

## Node Recruitment Script

Task 2 Recruitment Script
Generator Waste Characterization Study

Hello, my name is $\qquad$ and Iam calling from CalRecycle regarding the statewide waste characterization study we're carrying out next year.

Could I please speak to the operations or facility manager about helping us out with this study?

## [once the correct person is on the phone]

The reason I am calling you today is to ask for your assistance with this year's study.
[if we've sampled at this facility previously, mention that this will be less intrusive than the work we did in $\qquad$ _]

Part of the study involves collecting samples of waste directly from the dumpster at businesses within a 30 mile radius of your facility. What we are asking from you is:

- The use of your facility as a place we can bring these samples to sort and then dispose of when finished.
- We anticipate collecting samples of MSW from up to 100 businesses in your region and each sample will weigh approximately 200 lbs . (a maximum of 10 tons).
- The waste we will be bringing in is normal MSW collected directly from dumpsters of these area businesses-the same material that collection trucks would be collecting and disposing.
- We don't anticipate needing much assistance from your staff-our professional sorting crew has logged thousands of hours at landfills and transfer stations around the country- our only real requirement is that you provide us with a safe space large enough to allow our professional 4 person crew to stage and sort these samples. Something approximating 20 feet $X 40$ feet would suffice. Spaces used for this work have included unused commercial or self-haul tipping lanes or any other space that is out of your way and harm's way. A covered area would be nice but is not required.
- If the sorting crew is setup where they can dispose the material as they go (directly into the pit or onto the ground), they will. If they are set up where that isn't an option, you will need to provide a container for them to dump sorted material into which you can empty as needed.
- We may need to work at your facility for up to 15 days.
- Access to a restroom would also be required.

If this sounds like something you could assist us with, then I some additional site and contact information questions that may take about 10 minutes to answer.

If Yes, proceed to the Task 2 Facility Data Collection Sheet

## Task 2 Facility Data Sheet--Generator Study

## Name of site:

1. SCHEDULE

Season recruited for sampling.July
[We are still finalizing the annual schedule and will contact you with specific date requests as soon as possible.]

Are there any dates that definitely will not work for you?
2. FACILITY CONTACT INFORMATION

Please circle or note the best way of contacting each person-phone, email, text, etc.
Physical address:
City, Zip:
Site owner/operator (company name or public agency name):

| Person approving use of the site: |
| :--- |
| Mailing address: |
| City, Zip: |
| Phone: $\quad$ Email: |

| Person with data about the site (if different): |
| :--- |
| $\quad$ Email: |
| Phone: $\quad$ Fax: |

| On-site manager or supervisor (primary contact for logistics): |
| :--- |
| Phone: Email: |
| Will this person be available on the indicated dates? |

Contact person for crew when they arrive the morning of sampling:
Phone: Email:

| Backup contact: |
| :--- | :--- |
| Phone: $\quad$ Email: |

| Health and Safety Manager (if applicable) |
| :--- | :--- |
| Phone: $\quad$ Email: |

| Risk Management Contact (where should we send our proof of insurance?) |
| :--- | :--- |
| Phone: Email: |

## 3. SITE INFORMATION

Facility's hours of operation:
$\qquad$
Hours we would be allowed to work, if different from hours of operation $\qquad$ -

Do you close early if you have reached your allowed daily tonnage amount? Yes No
Estimate how many times per month this happens. $\qquad$ /month

Are there site conditions we need to be aware of such as high winds, snakes or other animals, or other special circumstances?

If you do have inclement weather that impacts operations, is there a secondary location where the crew can carry out their work?

Would it be possible for the sorting crew to be there when the site is closed, for example after hours or on weekends if needed?

## 4. SAMPLING AND SORTING PROCEDURES

We will be bringing MSW into the facility from local businesses. These businesses may or may not be part of the routes you are contracted to handle. Could we bring this material in free of charge as part of our study or should we plan on paying a tipping fee for it? What fee should we anticipate paying? $\qquad$ \$/ton.

We need an area for the sorting crew to work in for the entire time we will be at the site. It should be about the size of two truck bays $(20 \times 40)$. Can the site accommodate this? Where do you think that will be?

Is this space covered or will it be open to the elements? If open to the elements (landfill, etc.), could a temporary "pad" be installed (gravel, mulch, etc.) to make the workplace safter for the crew?

Is there a place to store our trailer with our sorting equipment and covered samples overnight?

Our crew will have up to date safety gear-hardhats, safety vests, coveralls, boots, and gloves-plus will cover a daily safety training plan. Is there any other PPE or special procedures you want them to use?

## 5. FINAL LOGISTICS

Any other issues or special circumstances we need to be aware of?

We will send you a copy of our insurance policy. Is there anything else you need from us?

Please remember to notify gate personnel of the dates we will be visiting your facility.
Cal Recycle may wish to visit the facility to observe the field procedures, would this be ok? If so, who should we coordinate this visit with?

We will provide a one month and a one week reminder of our visit. We will use these reminders to finalize and verify sampling and sorting logistics and dates. Would you like any other reminders?

If we have further questions, someone from the project team (CaIRecycle, Cascadia Consulting Group, or Sky Valley Associates) will contact you.

# Letter to Haulers Operating in Node Areas 

## Department of Resources Recycling and Recovery

RE: Statewide Waste Disposal Characterization Study
Dear Hauler/Recycler:
As we have done in the past, the Califomia Department of Resources Recycling and Recovery (CalRecycle) is conducting a major data collection effort in 2014 to characterize California's waste stream. This study will enable us to update and expand our Waste Characterization Database as it relates to several disposal sectors, as well as evaluate the effect the Mandatory Commercial Recycling law (AB 341) has had on reducing recyclables in the disposed waste stream. The database could not have been successfully developed without the cooperation and expertise of private sector haulers and facility operators. Such is the case today as we move forward with our efforts to update the database and improve its usefulness.

CalRecycle would greatly appreciate your support in performing this Statewide Waste Characterization Study, as some of your customers have been asked to participate. Field work will begin the week of «Start_Date».

A major part of the study involves sampling and characterizing trash and recyclables collected directly at generator (business) sites. Businesses throughout the state will be randomly selected and asked to participate in the generator-based study. A total of 800 businesses will be included in the study, and all 800 businesses will be sampled for trash. A total of 400 of these businesses will be randomly selected to be sampled for recycling as well.

1. The trash samples will be collected from dumpsters and transported to a central site where they will be weighed and sorted, then disposed. The crew will manage materials and abide by any operational and health and safety protocols required by the facility.
2. For recyclables, only materials placed in recycling bins will be sampled and sorted. The sorting will take place at the business site, and materials will be returned to the recycling bins.

Our contractor will be doing all the sample collecting, so your involvement is not needed for that part of the study. However, cooperation that may be needed from haulers and recyclers includes providing information on the service provided to the business - numbers and size of bins, frequency of pickup, pickup days, getting access to locked, bins, etc. Project staff will ask each busimess to identify its hauler and recycler when the business is contacted to participate in the study, so that project staff can contact the hauler if needed to get the necessary information. Please note that any information you provide will be kept strictly confidential and will be for obtaining waste characterization data only.

Cascadia Consulting Group is the main contractor for the study. The consulting firm conducting the field work for trash sampling is Sky Valley Associates and the crew chief is Brad Anderson. The consulting firm conducting field work for recycling sorting is L2 Environmental and the crew chief is Leslie Lukacs. CalRecycle staff will assist with some of the parts of the study and will also visit some sites to observe the field work.

All data from businesses will remain confidential, and only aggregate data will be reported to give statewide average information about the waste and recycling streams.

For questions or more information, please contact:
Nancy Carr, Project Manager
(916) 341-6216

Nancy.Carr@CalRecycle.ca.gov
Tom Rudy
(916) 341-6229

Thomas.Rudy@CalRecycle.ca.gov

Thank you for your cooperation in this important study.
Sincerely,

John Sitts, Manager<br>Knowledge Integration Section<br>Policy Development and Analysis Office

## Initial Business Recruitment Script

CALRECYCLE STATEWIDE STUDY--GUIDELINES FOR BUSINESS RECRUITMENT

## Introduction

$\mathrm{Hi}, \mathrm{I}$ 'm working with CalRecycle, Califomia's govemmental solid waste management agency. We're conducting a study about waste and recycling disposal and we'd like to request your help with this study. May I speak to $\qquad$ (contact name manager/owner?)

The purpose of the study is to find out how much and what kind of waste and recycling is being created and disposed by Califomia's businesses. The findings of this study will help the State plan for future recycling and disposal needs. Our research team wants to take a sample of garbage and maybe recycling from your dumpster or trash can, which we will take away, sort, and dispose. All the results of the study are completely anonymous and we will be averaging your results together with hundreds of other businesses statewide. No individual business will be identified in the study results.

The study consists of three parts:

1) This initial phone call(which will only take a few minutes)
2) A follow up phone call within a week to make arrangements for collecting a sample of garbage and to gather a few more details about your waste handling practices (which takes about 5-10 minutes).
3) A visit to your business to take a sample of garbage andjust look at your recycling. (which shouldn't take more than 10 minutes of your time and could take none or very little to none depending on how accessible your dumpsters are)
Would yoube willing to assist us with this study? We would be happy to provide you with the study results if you do participate, which can be helpful for your own personal waste and recycling planning.

- If no, thank them for their time and hang up.
- If yes, continue on...

## Screening Criteria

Thank you, I have a fewmore questions for you, just to verify your business meets a few criteria.

- Does your business have fewer than 5 employees?
- If no, move on to next question
- If yes, thank them for their time and say it won't work out
- Do you operate your business out of your home?
- If no, move on to next question
- If yes, thank them for their time and say it won't work out
- Do you share a dumpster (or compactor) with another business? (For instance, if in an office building or mall)
- If no, move on to next question
- If yes, thank them for their time and say it won't work out
- Do you generate at least 200 lbs of garbage between scheduled pickups OR do you generate 200 lbs of garbage over the course of one week? This 200 lbs is for garbage only, this does not include recycling or compost. An example of what 200 lbs might look like: two 96 gallon carts or a full one yard dumpster.
- If yes to either question, they pass and move on to the follow-up questions
- If no, thank them for their time and say it won't work out
(over)

CALRECYCLE STATEWIDE STUDY-GUIDELINES FOR BUSINESS RECRUITMENT
Follow-up Questions [They've said yes and pass all the criteria]
Great, if I could get some general contact information:

- Verify address, business name, and type of business (you are youin the business of...)
- If their current physical address is not the same as the physical address. supplied on the call sheet. xerify that their new zip code is still within the study area.
- What are the hours of operation for the business?
- Can I get the contact information for the person or persons, if different from you, who we should call back to get more detailed information about your disposal and recycling practices such as days garbage and recycling is collected, dumpster sizes, etc.? When is the best time to reach this person? How do they prefer being contacted? (phone, email, text)
- Do youknow where your garbage goes when collected?
- Landfill, transfer station, material recovery facility (MRF, pronounced "muff")
- Do youhave recycling service? Do you have compost service? (Food scraps, green waste, etc.)
- Subsequent calls and visits to collect information and material will be camed out by members of either our contracted researchteam, Cascadia Consulting Group, or by CalRecycle staff. Are both of these options acceptable to you?
Thank them and remind them that they will receive a follow up phone call within a week to gather more logistics about their trash and recycling.

## Notes:

## Business Recruitment Letter

## Re: Statewide Waste Characterization Study

Dear Business Owner or Manager:
CalRecycle is conducting a study of the types and amounts of materials in California's waste and recycling streams. We have randomly selected more than 800 California businesses to be part of the study. We need your help to get good data! Thank you for agreeing to participate. We use this information to:

1. Determine where specific material types are originating-and where they're ending up;
2. Track our progress in providing Californians the tools necessary to reduce our wastes; and
3. Identify key opportunities to support Californians in using less, recycling more, and taking resource conservation to higher levels.

This strategy has worked. With a $66 \%$ diversion rate, California is currently leading the nation in terms of program effectiveness. There are currently more than 100,000 jobs related to recycling and diversion in California, and as recycling increases, so will the jobs. Jurisdictions throughout the state are reaching new, higher levels of waste prevention and diversion; and businesses are transforming their industries by innovating new and better ways to manage resources.
You are being asked to help with two or three phases of the study:

- The first phase is a 15-20 minute phone interview asking general questions about your current trash and recycling services.
- The second phase consists of collecting a sample of your waste, which will be sorted at a local waste disposal or processing facility to determine the exact types and quantities of materials disposed. Please keep in mind that your trash will be combined with others from your business type and that your trash will be disposed of immediately and properly afterwards.
- About half of the businesses will participate in the third phase - an onsite survey of your business by one of our specially trained consultants to identify and measure current diversion practices. This may include sorting materials in your recycling or compost bins.
CalRecycle has hired Casca dia Consulting Group, Consumer Opinion Services, Sky Valley Associates, and L2 Environmental to assist with the study.
Any information about your business will be kept confidential and only aggregate totals will be used in the final analysis. The study results for your business will be provided to you upon request.
If you have any questions or would like more information about the study, please contact our Project Managers, Nancy Carr, at (916) 341-6216 or nancy.carr@calrecycle.ca.gov; or Tom Rudy at (916) 341-6229 or thomas.rudy@calrecycle.ca.gov. The project website is available at http://www.calrecycle.ca.gov/WasteChar/2014Study.htm. Thank you for your cooperation in assisting us with this important study.

## CALRECYCLE STATEWIDE STUDY-GUIDELINES FOR MULTIFAMILY RECRUITMENT

## Introduction

Hi, I'm working with CalRecycle, Califomia's govemmental solid waste management agency. We're conducting a study about waste and recycling disposal and we'd like to request your help with this study. May I speak to $\qquad$
The purpose of the study is to find out how much and what kind of waste and recycling is being created and disposed by Califomia's businesses, apartments, and houses. The findings of this study will help the State plan for future recycling and disposal needs. Our research team wants to take a sample of garbage and maybe recycling from your dumpster or trash can, which we will take away, sort, and dispose. All the results of the study are completely anonymous and we will be averaging your results together with hundreds of other businesses statewide. No individual business will be identified in the study results.

The study consists of two parts:

1) This initial phone call (which will only take a few minutes)
2) A visit to your business to take a sample of garbage and just look at your recycling. (which shouldn't take more than 10 minutes of your time and could take none or very little to none depending on how accessible your dumpsters are)

Would yoube willing to assist us with this study? We would be happy to provide you with the study results if you do participate, which can be helpful for your own personal waste and recycling planning.

- If no, thank them for their time and hang up.
- If yes, continue on...

## Screening Criteria

Thank you, I have a fewmore questions for you, just to verify your business meets a few criteria.

- Do you share a dumpster (or compactor) with a business or other apartment building?
- If no, move on to next question
- If yes, thank them for their time and say it wont work out
- Do youhave 5 or more apartment units?
- If yes, they pass and move on the follow-up questions
- If no, thank them for their time and say it wont work out
- 

Follow-up Questions [They've said yes and pass all the criteria]
Great, if I could get some general contact information:

- Can I get the contact information for the person or persons, if different from you, who we should call back to get more detailed information about your disposal and recycling practices such as days garbage and recycling is collected, dumpster sizes, etc.? When is the best time to reach this person? How do they prefer being contacted? (phone, email, text)
- How many units are in the building? How many of those are normally occupied (are there usually vacancies)?
- Do youknow where your garbage goes when collected?
- Landfill, transfer station, material recovery facility (MRF, pronownced "murf")
- Do you have recycling service? Do you have compost service? (Food scraps, green waste, etc.)
- Subsequent calls and visits to collect information and material could be caried out by CalRecycle staff. Would this be acceptable to you?

Thank them and remind them that they will receive a follow up phone call within a week to gathermore logistics about their trash and recycling.

## Re: Use of Your Apartment Complex for Statewide Waste Characterization Study

Dear Apartment or Mobile Home Complex Owner or Manager:
CalRecycle is conducting a statewide waste characterization study to gather information on materials disposed by residential and commercial sources. Apartment complexes and mobile home parks are needed for the study to gather information on residential waste. This research will help to track our progress in meeting waste reduction goals, and in determining future steps to continue to reduce waste. Your site was randomly selected to be one of 50 sites throughout the state, and data from all sites will be combined to produce general information on waste from apartments and mobile homes. Any specific information for individual sites will be kept strictly confidential.

A sampling crew of 2-3 people will visit your site and remove a sample of about 200 pounds of garbage from the dumpsters at your site and place it in a container they bring with them. This sample will be taken to a nearby facility where samples from residential and commercial garbage trucks are also being collected. Once the sample has been sorted and weighed the material is disposed of along with trash from other samples. The sampling crew may visit early in the morning or in the evening on a day agreed upon in advance. This work is expected to begin the week of January 20, 2014 and conclude in November 2014.

At this time we need the following information to arrange sampling:

> Who to contact at the site
> Location and accessibility of dumpsters
> Waste hauler name and pickup days
> Total number of units and number of occupied units

Our contractors, Cascadia Consulting Group and MSW Consultants, will be contacting the site to collect building information shortly before the sampling date. The sampling crew will be from MSW Consultants. John Bowles is the crew supervisor.

Thank you for cooperating with this study!
If you have any questions, please contact either of the following staff at CalRecycle:

## Appendix E: Detailed Composition Tables

The tables in this appendix detail the composition for the overall commercial sector, each industry group, and multi-family using the full 82-item material list.

## Means and Error Ranges

The data from the sorting process were treated with a statistical procedure that provided two kinds of information for each of the material types:

- The percent-by-weight estimated composition of waste represented by the samples examined in the study; and
- The confidence interval for the composition estimates.

All confidence intervals were calculated at the 90 percent confidence level. The equations used in these calculations appear in the Appendix C: Description of Calculations.

The example below illustrates how the results can be interpreted. In this example, the best estimate of the amount of leaves and grass present in the universe of waste sampled is 3.8 percent. The figure 0.7 percent reflects the precision of the estimate. When calculations are performed at the 90 percent confidence level, we are 90 percent certain that the true amount of leaves and grass is between 3.8 percent plus 0.7 percent and 3.8 percent minus 0.7 percent. In other words, we are 90 percent certain that the true mean lies between 4.5 percent and 3.1 percent.

| Material Type | Est. Pct. | +/- |
| :--- | :---: | :---: |
| Leaves and grass | $3.8 \%$ | $0.7 \%$ |

Confidence intervals were presented for each estimate of the amount of a material in the disposed waste stream and the curbside diversion streams. It was possible to calculate these expressions of our "certainty" in the percentage estimates for these streams because the composition estimates were based on a statistical sampling regimen involving randomly chosen segments of the stream (i.e., randomly chosen businesses, randomly chosen dumpsters, and randomly chosen scoops of material). In contrast, it was not possible to calculate similar confidence intervals for the other diversion composition estimates because the diversion estimates were not based on a statistical sampling approach. Instead, the study protocol called for the researchers to quantify all of each type of material that was diverted by each selected business, and their methods consisted more of tallying and accounting than randomized statistical sampling.

## Infrequent Material Types

Composition estimates for certain materials have a higher degree of uncertainty for two main reasons:

- The materials are infrequently disposed, and, consequently, appear infrequently in samples. Examples of such materials include paint, tires, and
ash. Because the composition results are based on few instances of these materials, the results are less certain, as shown by the relatively large confidence intervals.
- The quantity of material is highly variable between samples. Treated medical waste, for example, is rarely found in a sample. When it is found, there is usually a large quantity of it (because the sample was generated at a hospital or other treatment facility). This variability also increases the confidence intervals.

As an example, remainder/composite household hazardous is estimated to comprise 0.1 percent of the overall disposed stream with a 0.1 percent confidence interval. In other words, remainder/composite household hazardous may be as much as 0.2 percent or as little as 0.0 percent of the waste stream, 100 percent more or less than the best estimate ( 0.1 percent). Small, lightweight materials that appear frequently in samples also make up a small percentage of the overall composition. These frequently found materials, in contrast, have smaller relative confidence intervals. An example is PETE containers - CRV, which comprise a small percentage of the overall waste stream ( 0.3 percent) and have a relatively small confidence interval ( 0.036 percent).

Table 99. Detailed Composition - Disposed: Overall Commercial Sector

| Material | Estimated Percent | +/- | Estimated Tons | Material | Estimated Percent | + /- | Estimated Tons |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Appendix G: Recommendations for Future Studies

The project team spent nearly two years planning the study, executing the fieldwork, and evaluating the field data. Over the course of the project we learned that:

- Everything will take twice as long as expected.
- A firm commitment from the node facilities should be received before beginning recruitment. The project team spent many days chasing sort locations when node facilities backed out at the last minute.
- Field schedules should be flexible to ensure that each season's business recruitment is completed prior to beginning fieldwork.
- A process for handling the data analysis for generators with mixed-waste processing should be articulated prior to beginning fieldwork.
- Obtaining cooperation from the local haulers is critical. Accurate estimates of the collection schedule at each business increases the fieldwork efficiency. The hauler is the only entity with reasonably accurate collection information; the generator sites rarely know their collection schedule, much less the time of collection.
- Not every site will be able to provide complete quantity and composition data. Budget to make approximately 10 percent more site visits than the goal.
- 200 pounds is too large for generator waste samples. Many businesses were dropped from the recruitment process because it takes them several weeks to generate 200 pounds of disposed waste.
- Identity theft and privacy concerns will continue to make random business recruitment more and more difficult.
- Chains and large corporations are particularly difficult to recruit because of their corporate bureaucracy.
- Carefully define the waste streams so that it is clear what counts as curbside diversion and what counts as Other Diversion. A business that bales its cardboard, for example, falls into a gray area: Is it Curbside Recycle or Other Diversion?

Preparing for and addressing these items will help future studies run smoothly.

## Appendix H: Health and Safety Plan

Cascadia Consulting Group, Inc.'s health and safety plan is detailed below.

## 1. RESPONSIBILITY

The Cascadia Human Resources department (HR) has the responsibility for implementing and maintaining the Health and Safety Program for Cascadia Consulting Group, Inc. Cascadia supervisors and project managers are responsible for implementing and maintaining safe working practices in their work areas and for answering worker questions about the Health and Safety Plan. A copy of this Health and Safety Plan is provided to all Cascadia Consulting Group, Inc. employees on the intranet (under the HR tab) and reviewed with new employees during the onboarding process.

The Cascadia Consulting Group, Inc. Health and Safety Plan is not a static plan. As conditions and situations arise, this Health and Safety Plan will be updated and augmented in accordance with OSHA and MSHA standards.

## 2. COMPLIANCE

All workers, including supervisors, are responsible for complying with safe and healthful work practices. Our goal is to ensure that all Cascadia Consulting Group, Inc. workers understand and comply with these practices. To accomplish this, our procedures include informing workers of the provisions of our program via training of current staff and new staff, evaluating the ongoing safety performance of all workers, and providing additional training to workers whose safety performance may be deficient.

The employees of Cascadia Consulting Group, Inc. often perform their duties as visitors to disposal facilities. The procedures described in our program in no way supersede requirements which may already be in place at these facilities. Instead, this plan is designed to augment and work in conjunction with any site safety plans in place at these facilities. We follow all facility safety requirements that are more stringent than our own. When our safety procedures exceed those of our host, workers must follow our procedures, regardless of whether the host facility has any such requirements.

## 3. COMMUNICATION

Cascadia Consulting Group, Inc. is committed to providing a safe work environment for all of its workers. All supervisors and/or project managers are responsible for communicating with all workers about occupational safety and health in a form readily understood by all workers. Workers are encouraged to inform their supervisors and/or HR about workplace hazards without fear of reprisal. If you discover something that could cause injury or is unsafe, tell your manager or supervisor immediately.
Cascadia Consulting Group, Inc. routinely communicates with and instructs employees about general safe work practices and hazards unique to each employee's job assignment. Our overall communication system includes the following elements:

- New worker orientation, which includes a discussion of safety and health policies and procedures
- Worker training in the specific protocols of our field procedures
- Scheduled and "tailgate" safety meetings
- Posted or distributed safety information
- Periodic review of our Health and Safety Program

The employee's supervisor is responsible for ensuring that all field personnel have read and understood the master copy of this Health and Safety Plan document, and that all workers have received orientation and training in the safety protocols to be followed in conducting our work.

Each supervisor and project manager has the duty and responsibility to:

- Ensure that the procedures in this document are followed.
- Be familiar with local emergency services, and maintain a list of emergency phone numbers.
- Conduct "tailgate" health and safety meetings to notify workers of any changes in safety protocol.
- Inspect personal protective equipment and ensure proper use of such equipment.
- Monitor on-site hazards and early health warning signs (e.g., heat stress/stroke, dehydration, or fatigue) of site personnel.
- Stop unsafe operations and summon emergency services when needed.

The supervisor and/or project manager will brief workers on health and safety protocols particular to the host site. This will include emergency evacuation and rally point information to ensure that, in the event of an emergency, all Cascadia Consulting Group, Inc. workers will adhere to site-specific evacuation and management procedures.

## 4. HAZARD ASSESSMENT AND PREVENTION

We perform assessments of possible work hazards, and the procedures to work safely around them, when:

- New substances, processes, procedures, or equipment that present potential new hazards are introduced into our workplace.
- New, previously unidentified hazards are recognized.
- Workplace conditions warrant an assessment.
- Occupational injuries and illnesses occur.

On a daily basis, supervisors and/or project managers are to identify and evaluate workplace hazards that may be present at each work site. We routinely encounter the same day-to-day risks when we conduct our work. Yet, each facility is different and may present unique hazards that can affect us. These are some possible hazards that may occur during our work:

## Physical hazards:

- Cuts and punctures
- Lifting
- Slipping and falling
- Heat stress and fatigue
- Traffic or heavy equipment movement
- Noise exposure
- Animal and/or insect bites

## Airborne contaminants:

- Dust and windblown debris

## Chemical hazards:

- Liquid spills from containers
- Household and hazardous chemicals

## Biological hazards:

- Household hazardous wastes
- Medical wastes
- Items contaminated with blood/body fluid
- Hypodermic needles

## Vaccinations

Due to the nature of waste composition sampling, exposures to airborne pathogens and subcutaneous introduction of pathogens are possible. In accordance with OSHA regulations, Cascadia employees who will be performing work in which they may be exposed to airborne pathogens and subcutaneous introduction of pathogens will be offered tetanus and hepatitis B vaccines at the cost of Cascadia Consulting Group, Inc. An employee may decline to accept the vaccination by signing a statement acknowledging that: (1) he or she understands that he or she is at risk of acquiring the hepatitis $B$ virus infection; (2) he or she has been given the opportunity to be vaccinated at no charge; and (3) he or she is declining the vaccination at the present time but
understands that if he or she continues to be at risk, he or she will still be able to receive the vaccination series at no charge.

## 5. ACCIDENT/EXPOSURE INVESTIGATIONS

Procedures for investigating workplace accidents and hazardous substance exposures include:

- Interviewing injured workers and witnesses.
- Examining the workplace for factors associated with the accident/exposure.
- Determining the cause of the accident/exposure.
- Taking corrective action to prevent the accident/exposure from reoccurring.
- Recording the findings and actions taken.

## 6. HAZARD CORRECTION

Timely corrective action will be taken to remedy an unsafe condition, practice or procedure. When an imminent hazard exists that cannot be immediately abated without endangering employee(s) and/or property, we will remove all exposed workers from the area.

## 7. TRAINING AND INSTRUCTION

All Cascadia Consulting Group, Inc. workers, including supervisors, shall have training and instruction on general and job-specific safety and health practices. Training and instruction is provided:

- To all new workers who will be performing fieldwork.
- To all workers given new job assignments for which training has not been previously provided.
- Whenever new substances, processes, procedures, or equipment are introduced to the workplace that present a new hazard.
- Whenever Cascadia Consulting Group, Inc. is made aware of a new or previously unrecognized hazard.
- To supervisors to familiarize them with the safety and health hazards to which workers may be exposed.
- To all workers with respect to hazards specific to each employee's job assignment.

Cascadia Consulting Group provides for its workers the proper safety equipment for performance of duties associated with waste sampling. These items include:

- Coveralls or protective outer wear (optional)
- Rubber gloves and liners (required)
- Lower back support apparatus (optional)
- Hearing protection (optional/based on site requirements)
- Safety glasses (optional/based on site requirements)
- Reflective safety vests (required)
- Hard hats and liners (required)
- Knee pads (optional)
- Tetanus and hepatitis B vaccinations (required, or sign waiver)

During the conduct of our fieldwork, the following personnel health and safety guidelines are to be followed:

- Be in good physical condition, maintain a current tetanus booster and hepatitis B shot, and not be oversensitive to odors and dust.
- Be able to communicate in English, and be able to read warning signs/labels.
- Routinely check personal protective equipment and work clothing for proper fit and condition; replace or repair defective items immediately.
- Always look at what you are picking up or sorting-the most effective way to prevent cuts and punctures is to see what you are handling. Use a small rake or shovel to move material around for sorting.
- Lift properly, and ask for assistance when lifting heavy or bulky items.
- Be on the lookout for slipping and tripping hazards.
- Do not attempt to identify unknown chemical substances in unlabeled containers; never sniff anything to see what it is.
- Wash hands and face before eating or drinking.
- Smoke only in designated areas.
- Consume plenty of fluids during hot days, and watch for signs of heat-related illness, both in yourself and your crewmates.
- Be aware of your surroundings and alert to the possibility of unexpected hazards.
- Alert your supervisor if you feel ill, overly fatigued, or injured.
- Treat even minor cuts and injuries immediately.
